PANCHAYATI RAJ BILL

Nature is colourful.

We keep it that way.

The vibrant blue of her skies. The lush green of her trees. The rich brown of her soil... Colour-Chem helps keep Nature that way.

Because Colour-Chem ensures that its operations are in no way harmful to the environment. Well equipped effluent treatment plants render the liquid wastes harmless prior to discharge. Pollution abatement equipment control atmospheric emissions.

So that Nature can continue to show off her original colours. Now and for all time.

Colour-Chem

Where chemistry takes many hues.

Panchayati Raj Bill

The real issue in regard to the Constitution (64th Amendment) Bill on panchayati raj is not the election gimmickry behind the proposals but whether the proposals are in the longer-term interest of the country. In other words, is the proposed constitutional amendment desirable? Are there any serious flaws in the bill as presented to parliament? What should be the approach and attitude of the people generally and of the elected members of parliament and of the state assemblies to the proposals? 1429

It is not the Constitutional Amendment Bill that is the problem, but some of the other elements in the prime minister's panchayati raj package. The centrepiece of these elements is the proposed role for the collector or the district magistrate and this has to be seen in the context of the much publicised concept of district planning in which officials will have the activist role with the more passive role for the elected representatives. 1433

International Capital Market

The international capital market as it has been evolving provides an opportunity for developing countries like India to attract the required capital resources for accelerating their pace of development, manage their foreign exchange assets and liabilities to their advantage and develop export capabilities in the field of financial services. Active participation in this market would also indicate the institutional and policy framework for developing effective and efficient domestic financial markets. 1463

Putting the Clock Back

For the last two years the Andhra Pradesh government has been trying relentlessly to repeal the law enacted nearly two decades ago which prohibits any transfer of land in the scheduled areas of the state to non-tribals. This move, which has received the support of all political parties, including the left parties, has ominous implications for the state's tribal population. 1442

Socio-Economic Change and Health Behaviour

Studies of health behaviour by cultural anthropologists have considered health behaviour of rural populations in isolation. It has been necessary, therefore, to develop an alternative conceptual framework which emphasises the close interaction of health behaviour with cultural perception and access to health services. A wide-ranging study of health behaviour in 19 villages spread over 8 states and covering a time-span of 15 years provides information on rural social, cultural and economic transformation on the one hand and changes in health behaviour on the other and highlights the close correlation between the two. 1474

On a Higher Growth Path?

With the publication of *National Accounts Statistics, 1989* it is now possible to assess the trends in the growth of manufacturing output in the 1980s and to compare them with the performance in earlier periods. The observed changes in the 80s could have major implications for the long-term trend in industrial output. 1481

Thatcherism's Sunset

The changes that are likely to follow the Tory debacle in the 1989 European elections will almost certainly weaken the Thatcher government. Whether or not the Labour Party will be ready to take over will depend on its capacity to consolidate the gains already achieved and to put together a viable package aimed at undoing some of the major damages inflicted during the 10 years of purblind Toryism. 1446

Business and Politics

As the nation industrialises, organised business activity begins to provide an increasing share of goods and services and to generate more and more employment opportunities in the economy. Business, thus, ceases to be a mere economic activity and develops a social character. An attempt to understand the relationship between business and society is, therefore, not only desirable but also necessary. Report on a seminar. 1437

Cotton Export Fiasco

The government has failed to take advantage of the extraordinary opportunity for exporting cotton, especially long and extra long staple cotton. Despite the exceptionally favourable international environment, the export quota of 1 lakh bales each of Bengal Deshi and extra long staple cotton is unlikely to be fully utilised. 1426

NDDB's Market Intervention Operations in Oilseeds

WE have read with interest the comment 'Vegetable Oils: Swayed by World Bank' (June 3). We are in agreement with several points made by you. For example, groundnut oil being the preferred cooking medium for a large majority of consumers, the groundnut oil price will always lead those of other oils. As such, the price band for mustard oil cannot be the same as the price band for groundnut oil. It is our understanding that the NDDB has made a strong case for having different price bands for mustard oil and groundnut oil. The price band recommended by NDDB for mustard oil is Rs 17,000 to Rs 23,000 per tonne wholesale price inclusive of taxes.

Currently, the price of mustard oil in Calcutta rules around Rs 17,000 per tonne including taxes. They had been ruling between Rs 17,000 and Rs 18,000 for the last two months. Thus the market intervention operations (MIO) launched by government of India through NDDB have been able to accomplish the lower limit of the price band. In this connection, it is useful to note that the mustard seed prices have stabilised from the end of March till now around Rs 5,500 per metric tonne. What is more important is that by the beginning of June more than 80 per cent of the mustard produce was already traded in the market at this price of Rs 5,500 or thereabouts. Thus the mustard producers have got the full benefit of the market intervention operations. Mustard seed now left with the producers is mainly with large farmers and village level traders who acquire this stocks for speculative purpose. It is undoubtedly true that the market intervention operations have benefited a large majority of small producers.

We are surprised that you claim that the NDDB's efforts in stabilising the market have been half-hearted. Your own estimates of the operations of the NDDB (60,000 tonnes of mustard oil and 75,000 tonnes of mustard seeds) amount to Rs 150 crore. It is known that the value of the oils and oilseeds acquired under market intervention operations by the NDDB is close to Rs 400 crore. It may be noted that the government of India approved the MIO and provided necessary credit to the NDDB only in April 1989. Most of the oil stocks were acquired by the beginning of June 1989. It may also be noted that till recently the government was managing the oil economy through imports of oil using the storages created at various ports. In mustard producing western and north-western India there is no infrastructure in existence for storing oil. There is no existing physical infrastructure for ensuring smooth flow of oil from the producing centres to the consuming centres. It is high time that the NDDB created such an oil grid comprising storage and movement facilities.

Your inference that MIO have been influenced by the thinking of the World Bank seems to be a little far-fetched. As is known, in the year 1987-88 (oil year) the country produced 38 lakh tonnes of edible oil and imported 18 lakh tonnes of oil. This year, domestic production has been estimated at 51 lakh tonnes. This alone eliminates the need for importing 13 lakh tonnes of oil. Given the opening balance of 3 lakh tonnes of edible oil with STC and 2 lakh tonnes oil already imported before the NDDB got into operations, there appears to be no cause for future imports in this year. However, in case groundnut oil prices are to be kept at reasonable levels, it may become necessary for the country to import some edible oil. It is known that the MIO did not start till the peak of the groundnut season in the 1987-88 oil year was over. It must be borne in mind that whatever be the imports, the manner in which imports are done should not hurt the interest of Indian farmers.

It is felt in the industry that the mustard oil production in the country is of the order of 1.4 million tonnes as against the demand for mustard oil placed at 9 lakh tonnes. Thus there appears to be an excess of mustard oil production by 5 lakh tonnes. It is high time to move in the direction of introducing and popularising refined mustard oil consumed in the country.

We fully agree with you that the World Bank's assessment of the price support and buffer stock programme for edible oil is grossly biased towards their pet theme of free trade and ignores the field reality. We believe that the stagnation in oilseeds production has resulted from lack of incentives to farmers for investment in better technology of oilseeds production. Once prices are stabilised, better technological measures, already known and available within the country, will be adopted quickly by the farmers. As such this will result in much higher productivity of oilseeds crop, without necessitating any area shift from wheat and cotton as is argued by the World Bank. We therefore believe that the Bank's concern about there being a net loss in foreign exchange is unfounded. It may be worthwhile to note that in major wheat growing areas like Uttar Pradesh, oilseeds production and area under oilseeds have in fact been falling in the last five years despite good prices for oilseeds.

ECONOMIC AND POLITICAL WEEKLY

On a Dangerous Course

WHATEVER be one's opinion about the LTTE's political ideology or its methods, there can be little doubt that its leaders have an abundance of political acumen which can turn even a defeat into a triumph of sorts. At a time when it was wholly dependent on Indian support it sought to give the impression of having great faith in Rajiv Gandhi's initiatives; when it was left out in the cold by an accord which was a political necessity for Rajiv Gandhi and Jayewardene it promptly changed its tactics and became a lone fighter for Eelam betrayed by friends; and now when a desperate Premadasa put out an appeal for initiating a dialogue it not only agreed to come to the negotiating table but even declared first a ceasefire with the Sri Lankan forces and then a cessation of hostilities in return for being acknowledged as the key group in resolving the Tamil issue in the northern districts. This in itself is an admission on Premadasa's part that the India-Sri Lanka accord was not grounded on realities and hence could never be successfully implemented.

Not surprisingly, the Sri Lankan situation is rapidly deteriorating to its pre-accord norm. Only now there is the additional factor of the JVP in the south and a growing economic crisis. In the last couple of weeks at least two Tamil groups, EROS and TELO, have announced that they would take to arms again. There have been reports of Tamil youth being forcibly recruited by militants and of the government of India clandestinely arming TELO to keep the pot boiling in north Sri Lanka. The IPKF is going along its planned course of action ignoring the LTTE's offer of a ceasefire similar to the one it declared against the Sri Lankan forces. That the IPKF's actions and campaigns have been unsuccessful in worsting the LTTE is clear to everyone concerned, but the myth of the Indian troops' presence being necessary for maintaining peace has to be kept up with widely publicised operations.

The government of India in the meanwhile is following a highly dangerous path. If it continues the same trend of moves and manoeuvres as in the past month, it will be squarely responsible for plunging Sri Lanka into a chaos worse than already exists. Its refusal to withdraw the IPKF is pushing it into a thoroughly untenable position with the IPKF becoming something of an occupation force. The Indian forces have no legitimate role to play in the affairs of the island nation now—in fact they never had. And yet India is once again seeking to prop up yet another Tamil group, this time the EPRLF, just so as to create a situation which will justify the presence of the Indian army. The EPRLF's shrill complaints against the Sri Lankan government's action echo the LTTE's noises in the past, though it is true of course that the Premadasa government has done little to hasten the devolution process. But this is no reason for the continued presence of the IPKF, which was mainly for peace keeping operations. Unless, because of the rearming of the militant groups, a situation is created which warrants the presence of a peace keeping force. It would be utterly foolish for India to let such a state of affairs develop. Even the short-sighted pundits in New Delhi can, one hopes, see this. There are several factors which contribute to the confusing picture. For one thing the LTTE's declaration of a cessation of hostilities is not accompanied by any statement about laying down arms. In fact Ranil Wickramasinghe, the minister of industries in the Premadasa government, categorically stated that his government had not asked for the laying down of arms, but that the LTTE declaration implied such a sequel. The IPKF has refused to consider the LTTE's offer of temporary ceasefire pending discussions. This means that any attempt to heighten the tensions in the region will see the LTTE strong-arm in action once agin. And then the resulting conflagration will be much worse than ever before.

There is another factor to be kept in mind. The JVP-led mass agitations, it must be stressed, are not merely against the Indian presence in Sri Lanka. While 'Indian imperialism', as the JVP terms it, is a major issue around which the people have been mobilised, reports of coercion notwithstanding, the substantive issues are rooted in the deteriorating economic situation. Premadasa is well aware of this and has sought to defuse the agitation by acceding to the major demand for the withdrawal of the Indian troops, this being far easier than tackling the more fundamental economic issues which have been raised. The IPKF withdrawal will buy him much needed time. But if the JVP is indeed leading a genuine mass upsurge, then the Premadasa government will have to face a period of growing tension, perhaps similar to the one which so many years ago pushed the JVP underground with Indian help. In a manner of speaking, the IPKF is a minor issue to the Sri Lankan government. The irony however is that the Indian state appears to be blind to the fact that what is happening in the south of Sri Lanka is of far greater significance to its regional power aspirations than the presence of the IPKF in the north.

MINIMUM WAGES

Callous Delay

ACCORDING to press reports, it has taken 12 years for the president to return a bill passed by the Kerala state legislature with his recommendations for some modifications. The bill, passed in 1977, provided for the payment of minimum wages for casual, temporary and 'badli' workers. The president has now directed the legislature to exempt all establishments belonging to or under the control of the central government from the provisions of the proposed law.

Even if about a third of the long period of the centre's callous inaction was accounted for by the Janata regime, the remaining eight years covered Congress rule, one-half of which is again represented by Rajiv Gandhi's tenure. Taking for granted the unquestioned deficiencies of the Janata government, one cannot but wonder about the performance of the government which came to office with the promise to provide the country with "a government that works" in the first instance, which in turn was followed the same party's government that boasted of its capability to "work better". Tall and taller promises, unmatched by appropriate actions, in this case indeed by any action at all.

The president's directive which took 12 years to come, raises not only the question of promptness or otherwise of action, but also that of the government's socio-economic inclinations. Rajiv Gandhi has in the very recent period been shedding copious tears about the deprivations of the poor and marginalised population in both the rural and urban sectors. Yet his government sat for more than four years upon this bill touching upon the minimal welfare of the most marginalised sections of, generally, rural migrants into the urban areas, but also even more heartlessly excluded a section of this miserable mass—that is, those working in central government establishments—from the purview of the law. So much for Rajiv Gandhi's concern for the poor and the deprived.

The state governments under the Left parties have long been protesting against the constitutional provision that gives the president and state governors the powers to sit in judgment on the laws passed by the state legislature in certain cases. This constitutional provision may not be altogether dispensed with in our federal set up for the sake of guarding against the contingency of a state law which may be incompatible with or repugnant to the spirit of the polity or a major central law. As a result, there is the possibility of a central directive seeking a reactionary twist to a progressive state legislation. The remedy against this has to be sought in the mobilisation of public opinion in each specific case. But there can and should be some protection at least against the callous indifference of the centre as in this case of the 12-year delay in returning the Kerala bill. A bill if not returned after a specified and reasonable period should deemed to have got the requisite assent.

EDUCATION

Co-operative Colleges

M Shatrugna writes:

IN its drive towards privatisation of higher education, the Telugu Desam government in Andhra Pradesh had a couple of months ago enacted legislation to allow junior colleges (+2 stage) in the 'co-operative' sector. Already 134 letters of intent have been issued and 75 colleges have started functioning all over the state. Called 'Sahakara Junior Kalasalalu' the colleges are in addition to the government-run, government-supported (aided) and private (unaided) colleges numbering 661 with an annual intake of 3.14 lakh students. According to a note on education submitted to the last session of the state assembly, "the idea in permitting junior colleges in co-operative sector is to help the spread of higher education by supplementing the existing inadequate educational facilities. These junior colleges will be managed by local people through a managing committee in which the parents and donors would be represented." The co-operative colleges would be registered under the AP Co-operative Societies Act, 1964.

As per the original scheme the Sahakara Junior Kalasalalu were to be located in those mandals where there are no facilities for higher education. The government after an enquiry found that out of a total of 1,104 mandals, 686 mandals were without any eductional facilities after the high school stage. A mandal on an average consists of 15 to 20 villages. As was to be expected, the 686 mandals without higher educational facilities are in some of the most backward areas of the state like Telengana and certain districts in coastal Andhra Pradesh like Srikakulam. Though the government's concern for providing higher education in the backward mandals is laudable, the solution it has devised is thoroughly inegalitarian and is likely to go against the interests of poor students as well as the teaching staff of these colleges.

While the rules for the establishment of co-operative colleges look fine on paper with such provisions as insistence on documentary evidence to the effect that the education society possesses Rs 5 lakh in a scheduled bank (for the construction of the college building) and five acres of land, etc, the catch lies in the manner in which finances are sought to be raised for the colleges. According to rule 21, the managing committee (MC) of the colleges has been left free to fix the fee structure. The criteria for admission (like marks obtained in the 10th class) are not spelled out. The usual reservations for SCs, STs and BCs are also not mentioned in the rules. In other words, whoever can pay can hope for admission. On a conservative estimate the per capita expenditure on a junior college student is Rs 1,500 to Rs 2,000 per year. So a co-operative college student would be charged not less than Rs 2,000 per year as tution fees.

The other area of concern relates to the service conditions of the teaching and non-teaching staff. Rule 19 clearly says that "appointment of the staff, both teaching and non-teaching, shall be outside the purview of Andhra Pradesh College Service Commission". At present recruitment of teaching and non-teaching staff in colleges is supposed to be undertaken by the two-year old AP College Service Commission. The setting up of an autonomous College Service Commission had been one of the long-standing demands of college teachers. After a long struggle by college teachers, the College Service Commission was ultimately set up two years ago, though it is yet to start functioning. Now the staff of the co-operative junior colleges has been explicitly left out of the purview of the commission.

As for salaries for the staff, the scales of pay are to be decided by the MC of the society from "time to time, depending upon the financial position of the society." When even in the so-called private (unaided) colleges where the teachers are supposed to get government-fixed rates but get paid only Rs 1,000 per month according to last year's market information) then one can imagine the plight of teachers in the co-operative colleges. At the same time, teachers in these colleges will be governed by the code of conduct prescribed for teaching staff in "other private junior colleges".

Finally, a look at the location of the co-operative colleges shows that they are spread out all over the state and are not necessarily confined to the 686 'backward' mandals. Also, though out of the 75 existing colleges 42 are located in Telengana not many are located in the backward mandals of the region. The "lack of enthusiasm" for co-operative colleges in the backward mandals indicates that the people in these regions are too poor to run the colleges on the lines laid down by the government. In other words, while the most needy areas go without higher education facilities, the societies in the richer mandals would make quick mone

in the name of taking higher education to the backward regions.

The facility of starting co-operative colleges is being extended up to the degree college level from the current academic year. No new colleges (junior or degree) are to be permitted to be started in any sector other than the co-operative sector. Of course, one or two colleges in the government sector may be started, depending upon political compulsions. On the whole, the policy is not to start any new college with state assistance, thus implementing the recommendations of the notorious Vice-Chancellors' Committee (1986) which had suggested that no new college should be started with state assistance till the end of this century.

EXPORTS

Relying on TNCs

SOME of the government's economic bureaucrats in the Planning Commission want to put the export objective above all other socio-economic objectives. They feel dejected that India has not yet been chosen by the transnational corporations (TNCs) for international sub-contracting. After all, India possesses some of the advantages that TNCs seek in locating firms as sub-contracting units—low wage rates, tax holidays, FTZs, repressive labour conditions, provision for availing of economies of scale, and so on. Then why are the TNCs locating international subcontracting units more in Hong Kong, South Korea, Singapore, Taiwan and Malaysia?

Indian manufactured exports are still concentrated in garments and leather and leather goods. But these are the 'old' labour-intensive industries. The economic bureaucrats want India to become a significant exporter in the 'new' labour-intensive manufacturing industries like electronics and light manufacturing.

International sub-contracting is basically a relationship between a TNC (in trading and/or manufacturing) and either its subsidiary/affiliate, a joint venture or an independent third world producer which is geared towards meeting demand in the developed capitalist economies (DCEs). The TNC affiliate/subsidiary, joint venture or independent producer produces finished goods, components or services for the markets of the DCEs. Final marketing is controlled by the TNC together with, more often than not, the provision of technology, capital equipment, loan capital and management services. The economic bureaucrats of the Planning Commission presumably do not place much faith in the joint venture or the independent producer, for in times of cyclical recession exports may be slashed. They favour a reappraisal of the Foreign Exchange Regulation Act (FERA) to allow the TNC affiliates/subsidiaries to have a field day. Will this bring foreign direct investment into such areas as semiconductors, engineering goods, electronic memory circuits, etc? Even if this does materialise, the experience of the south-east Asian economies shows that there will be minimum backward and forward linkages.

PRISONERS

Violation of UN Code

PROLONGED silence can push a fact into oblivion and turn it into something which never happened. Very few people in our country remember the fact that India at one time signed the United Nations Standard Minimum Rules for the Treatment of Prisoners (adopted on August 30, 1955). The horrendous conditions in which prisoners are kept in our jails are occasionally revealed in the press, thanks to some enterprising social activist or investigative reporter. But it is seldom pointed out that the prevalence of such conditions is in direct violation of the UN Rules to which our government is a signatory, and that it is the responsibility of the UN Human Rights Commission to inquire into cases of such violation.

The latest case is that of the two Bombay college teachers—Dalip Singh, vice-principal and head of the History Department of Khalsa College, and Jagmohan Singh of the Department of Commerce of Jai Hind College, both of whom are lodged in Tihar Jail in Delhi for the last two months in connection with the Indira Gandhi assassination case. It is known by now that both of them are well known activists in the civil liberties movement in Bombay and their arrest has evoked protests from people of all walks of life who suspect that they are being hauled up on trumped up charges because of their association with the civil liberties movement.

A letter from them, smuggled out from Tihar Jail recently, reveals the plight they are facing. Under Rule 84(2) of the UN Rules, all unconvicted prisoners are presumed to be innocent and should be treated as such. Neither Dalip Singh nor Jagmohan Singh has been convicted as yet. Still, they are being lodged in the condemned death cells known as 'Kasuri Ahatha'. These cells are less than 50 steps away from the gallows where Satwant Singh and Kehar Singh were hanged. Is it a deliberate attempt to demoralise them psychologically?

Adequate facilities for accommodation, personal hygiene and food, as well as medical facilities, should be supplied to the prisoners in accordance with Rules 10, 11, 12, 20 and 22 of the UN code for treatment of prisoners. In flagrant violation of these rules, the two prisoners are given dirty food, denied any utensils, provided daily with only two buckets of water and one small pitcher with which they have to make do in the Delhi summer, and refused medical treatment (for Dalip Singh who suffers from diabetes and high blood pressure).

Under Rules 90 and 92 of the UN code, an untried prisoner is allowed books, newspapers, writing materials and other means of occupation. In Tihar Jail, newspapers seldom reach the two prisoners—and even when they do, the papers are not of their choice. Their religious scripture, Guru Granth Sahibji, is apparently regarded as 'subversive' by the jail authorities, who confiscated it when Dalip Singh's relatives brought it for him to the jail. Following a hunger strike by Dalip Singh and Jagmohan Singh in protest, after three days the book was returned to them, but without the holy robes which are a part of any copy of the religious scripture.

Let us add that all these things are happening in spite of an order by the chief metropolitan magistrate granting both the prisoners 'B' class facilities—facilities in conformity with the above-mentioned UN Rules—which are systematically being denied, in spite of repeated requests made by the two prisoners to the chief metropolitan magistrate and the district sessions judge of Tiz Hazari Courts. In a situation, where the executive and judicial authorities cannot—or will not—see to it that their own orders are carried out by the jail authorities, what course of redressal is left open to the prisoners?

TRIPURA

Growing Lawlessness

VERY few in India would take seriously the dramatics of a comic opera character like Kalpnath Rai, the union deputy minister (or has he been recently promoted to the next higher rank for his services to the boss?). Even then, lest his recent fulminations about the 'law and order' situation in West Bengal succeed in misleading some people, a section of his fellow partymen in Tripura have rendered a conscientious service to the cause of creating an informed and balanced public opinion by exposing the real situation in their Congress(I)-ruled state. They have highlighted, according to a press report, "rampant corruption" of the ministry as well as the administration and the "increasing lawlessness in the state." In a memorandum to the party high command, they have complained about an attack by the supporters of the chief minister himself on a police station and their beating up of some policemen there. They

have also referred to a case of abduction of a girl student at revolver point by "young men among whom were a leader of the State National Students' Union of India and several others identified as the chief minister's proteges". Citing some other specific cases, the report concluded, "crimes against women are on the rise throughout the state".

While all this may serve to prick the bubble of the righteous indignation publicly exhibited by some Congress(I) politicos about the by-no-means ideal law and order situation in states run by non-Congress(I) parties, this is most unlikely to persuade the Congress(I) supremo to take any corrective action in Tripura. Firstly, as a newspaper says, there is no prospect of an alternative within the Congress(I) fold in the state; secondly, the paper-thin majority in the state assembly presently enjoyed by the Congress(I)-TUJS coalition, which is actually based on a minority of popular votes, is too precarious to withstand even the slightest rocking by the leadership.

POLITICS

Was It Necessary?

A Correspondent writes:

THE West Bengal chief minister's "respectful homage" to Indira Gandhi when unveiling her majestic portrait at the Calcutta Raj Bhawan on June 15 cannot but raise some eye brows along with a number of questions.

First of all, was it really binding on a CPI(M) politburo member as a part of his constitutional duty as the Left Front chief minister of West Bengal to undertake this ceremonial function? Or did he do this because of his personal predilections and inclinations?

Secondly, is it permissible for a top communist leader to be guided by his or her personal equation with a bourgeois political leader with the type of political reputation that the late prime minister enjoyed and more particularly with the stigma that the chief minister's own party, the CPI(M), attaches to certain crucial periods of her political career?

Thirdly, is it a matter of a certain pride for a communist leader of Jyoti Basu's status to proclaim that "the relationship between Shrimati Indira Gandhi and people like myself in the opposition parties did not sour despit the political differences that we had", particularly in the context of her Emergency and post-Emergency policies and actions on the home front?

It would be interesting, if not enlightening as well, if someone on behalf of Jyoti Basu or his party would respond.

BUSINESS

COTTON

Lost Opportunity

THE 1988-89 cotton season which has only two months more to go offers an interesting study. Rarely—not in the near distant past anyway—has the official wholesales prices index for raw cotton been known to have moved in so narrow a range as it has this season—around 13 per cent against 22.1 per cent in 1987-88, 106.8 per cent in 1986-87, 27.2 per cent in 1985-86 and 22.7 per cent in 1984-85.

Excepting extra long staple cotton which is currently quoted higher by about 14 per cent, the ruling prices of different varieties of cotton are lower by 5 per cent to 10.5 per cent compared to the prices which prevailed at this time a year ago, reflecting improved supply in the face of record mill consumption. Even though the carryover stock of cotton at the end of August is unlikely to be any different from the opening stock, representing less than three months' consumption, the textile industry does not seem the least bothered about the supply and/or prices of cotton. Nobody really expects the market to develop the firmness associated with the lean period.

An outstanding aspect of the cotton scene which has been the subject of an animated debate in market circles is the government's utter failure to avail of the extraordinary opportunity for exporting cotton, especially long and extra long staple cotton. Indeed, never before has the international environment been so very favourable with the spread between cotton prices at home and abroad ranging between 20 cents and 40 cents a kg in respect of Bengal Deshi and between 60 cents and 80 cents a kg for extra long staple cotton. Even so, the export quota for one lakh bales each of Bengal Deshi and extra long staple cotton is not likely to be fully utilised. According to knowledgeable sources, export of Bengal Deshi cotton is not expected to exceed 65,000 bales and export of extra long staple cotton might not reach even 40,000 bales.

Undue delay in the announcement of minimum export prices which were fixed arbitrarily in complete disregard of the prices prevailing in the highly competitive overseas markets encouraged unscrupulous elements in the private trade to indulge in all sorts of malpractices in negotiating export deals with the result that neither the experienced traditional exporters nor the CCI and the other state/co-operative agencies could participate in this highly profitable export business.

Representations for revising the minimum export prices to realistic levels have so far evoked only muted response. Reports are that the government is not favourably disposed to lowering the MEP for Bengal Deshi presumably on the specious plea that the country will have exported more deshi cotton than in the recent past but there is every possibility of the MEP for extra long staple cotton being reduced from the present $ 4 to $ 2.80 a kg. The revised MEP for extra long staple cotton will certainly facilitate negotiation of fresh export business but prospects of achieving the one lakh bales target are generally rated low as the overseas buyers have already covered most of their immediate and near-term requirements.

It would be unfortunate if the various acts of omission and commission did not bring home to the government the imperative need to evolve a dynamic export policy as this may well have a crucial role to play in bringing about a better balance in the overall supply-demand equation as also in rectifying varietal imbalance resulting from the breakthrough in the production of long and extra long staple cotton which has of late been accounting for nearly 50 per cent of the total cotton output.

With the meteorological department forecasting a normal monsoon—the progress of the south-west monsoon has been quite satisfactory so far—the view is widely shared that cotton production could easily set a new record, decisively exceeding the 107 lakh bales mark established in 1985-86 if weather conditions remain favourable and timely measures are taken to minimise the impact of pest infestation. But should the next crop turn out to be really a bumper one, it could precipitate a 'crisis of plenty' if the government is not fully prepared with an appropriate policy package to deal with the emerging situation. One can take the view that because of the very hefty hike—Rs 100 a quintal—in the support prices of kapas after 1987-88, the government may have to resort to procurement on a massive scale to maintain prices at or above the official support level. Political compulsion w... demand effective market intervention. ... 1985-86, price support operations had co... the CCI a loss of about Rs 60 crore a... the Maharashtra Federation lost ov... Rs 300 crore, monopoly procurement h... ing assumed the form of price supp... operations. It needs to be noted that t... ruling prices of cotton are substantia... above the support prices fixed for ...

1989-90 season, with medium and long varieties quoted 30-40 per cent higher and extra long staple cotton about 80-90 per cent higher. How cotton prices might behave in the event of a bumber harvest is difficult to forecast. It would be rash to draw any firm conclusions about prices based merely on the size of the crop. The 1988-89 crop is only three lakh bales lower than the previous record harvest in 1985-86 but prices this season have ruled substantially above those in 1985-86, with the wholesale price index for cotton moving between 274.7 and 310 whereas in 1985-86 it had moved between 223.9 and 163.

Factors influencing the course of prices are many, the two major factors being the state of the textile industry and export policy for cotton. Unlike in 1985-86, the cotton textile industry is doing pretty well. With good domestic and overseas demand for yarn as well as fabrics (including readymade garments) mill consumption of cotton can be expected to show a further increase. And as for export of cotton, all indications point to a favourable global outlook. Much would, of course, depend on government policy and how it goes about implementing it. New Delhi could not possibly have envisaged a better opportunity for exporting cotton this season and it could not have done more harm to the cause it has been seeking to promote.

RAILWAY PLAN

Catching-Up Game

TO repair the damage done by decades of neglect, the working group on railways has recommended an outlay of Rs 41,600 crore for the Eighth Plan—two-and-a-half times the Seventh Plan allocation of Rs 16,538 crore. The main thrust of the next plan of the railways should be to generate adequate line, terminal and rolling stock capacities; complete the process of rehabilitation, replacement and renewal of overaged assets; modernise and technologically upgrade the system to achieve cost reduction; progressively electrify high density routes; improve the quality of passenger and freight services; and develop a perspective research and development plan.

The working group has projected railway freight traffic to increase to 445 million tonnes by the end of the Eighth Plan from the expected level of about 345 million tonnes at the end of the Seventh Plan. Passenger traffic has been estimated to grow at the rate of three per cent per annum to a level of 4,725 million passengers by 1994-95. Correspondingly, the freight and passenger traffic output is projected at 330 billion tonne kms and 322.2 billion passenger kms by the end of the Eighth Plan.

To cope up with this increase in freight and passenger traffic and transport outputs, the working group has recommended development of transport capacity by acquisition of 753 electric locomotives, 1,130 diesel locomotives, 12,100 coaches, 1,500 EMU-type coaches and 1,93,200 wagons. To generate adequate ground capacities, the working group has recommended an investment of Rs 5,100 crore in various traffic facility works like doubling of 2,400 kms of tracks, gauge conversion of 2,100 kms and development of terminal and other line capacities.

As part of the overall plan, production of concrete sleepers, which was 35 lakh pieces in the Sixth Plan, is expected to go up to 118 lakh in the Seventh Plan and 235 lakh in the Eighth Plan. Production of coaches which was 5,326 in the Sixth Plan is expected to rise to 6,700 in the Seventh Plan and 12,100 in the Eighth Plan. In view of the urgent need to upgrade technology as also to rehabilitate and replace overaged assets, the group has recommended an extensive programme of track rehabilitation (23,500 kms) and modernisation of workshops and of various plants and machineries.

The ambitious plan recommended by the working group will require the final approval of the Planning Commission. Given the resources constraint, one need not be surprised if there is some cut effected in the outlay recommended by the working group. It also needs to be stressed that in real terms, the outlay will turn out to be much less assuming an annual inflation rate of even 6-7 per cent.

Because of the resources constraints and the competing claims on available resources, the railway system has not grown much during the last 40 years. While the traffic has increased five-fold during this period, the railway system has registered a growth of only 16.7 per cent thereby leading to very intensive use of the existing corridors. Particularly between 1965 and 1980, the railway system had fallen into a state of disrepair causing a number of accidents of a serious nature and creating bottlenecks in the movement of goods and services. The process of rehabilitation began only during the Sixth Plan but the pace has been slow till 1985-86. It has gathered some momentum during the last two years. The working group has estimated that the recommended outlay is essential to make a meaningful start so that at least by the turn of the century the arrears of replacement/rehabilitation of overaged assets are made up and some progress is made in the construction of much needed new lines. The group has proposed construction of 3,335 kms of new lines during the Eighth Plan against 936 kms expected during the Seventh Plan.

TWENTY YEARS AGO

EPW, June 28, 1969

Recent developments in Vietnam appear to have raised hopes in New Delhi of an active Indian role in the negotiations comparable to that in the Korean armistice and the Geneva agreement in 1954. Unfortunately, our credentials for playing the honest peace-broker must appear somewhat less than satisfactory to North Vietnam. It is a fact, for instance, that government of India forbade all trade with North Vietnam even though strategic items like steel and heavy vehicles were permitted to be exported to South Vietnam. The official reason given for the embargo on exports to Hanoi has been the need to prevent strategic materials from reaching China through North Vietnam, but of course the real explanation is our anxiety not to incur the wrath of the United States... Carving out spheres of influence is a feasible and worthwhile proposition in the stable conditions of Europe, but not in those of Asia—whether west, south or south-east. There is a lesson for us as well in our recent experience with Nepal.

* * *

Crude oil is in the news again. Government is trying to pressurise the three private oil companies to reduce the price of imported crude from $ 1.38 to $ 1.28 per barrel. A British firm of consultants might be engaged to advise on the selection of a contractor for offshore drilling in the Gulf of Cambay. The ultimate aim in both cases is, one presumes, to make crude oil available to the refineries at the least price.... A solution can be found which reconciles both these problems. If a foreign oil company gets a drilling contract in the Gulf of Cambay, with participation options in production, it would almost certainly take it. Tenneco, for example, might tie up with any of the three refining companies. Thus government will not run any financial risks in exploration; it can insist on Indians being trained by the first company; and it can develop additional offshore wells later by buying new, technologically correct rigs. The new oil can be purchased at a reasonable price by the collaborating refinery, which can be permitted to expand to a corresponding extent. Payment for this crude will be only partially in foreign exchange for a limited period, say 7 years. This will serve all the obvious objectives of India's nebulous oil policy, the first of which should be to cut down on crude imports of Rs 85 crore per year.

BALLARPUR INDUSTRIES LIMITED

NOTICE

It is hereby notified for the information of the public that **Ballarpur Industries Limited** proposes to make a joint application with Jg Glass Limited to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval of the scheme of amalgamation of Jg Glass Limited with it.

Brief particulars of the scheme are as under:-

i)	Name and address of the applicants	: 1. **Ballarpur Industries Limited** Regd. Office: P.O. Ballarpur Dist. Chandrapur, Maharashtra. Head Office: Thapar House 124, Janpath, New Delhi. 2. **Jg Glass Limited** Regd. Office: Survey No. 197-198 Bombay-Pune Road, Pimpri Pune - 411 010.
ii)	Management structure of the undertaking(s) proposed to be merged/amalgamated	: Jg is a subsidiary of BILT and is managed by Shri S K Gupta, Manager, appointed by the Company in terms of Section 2(24) and 269 of the Companies Act 1956, subject to the Superintendence, control and direction of the Board of Directors comprising of the following: 1. Shri J P Agarwal 2. Shri G H Aswani 3. Shri K R Dadyburjor 4. Shri S S Lal 5. Shri Surendr Lall 6. Shri S C Nanda (ICICI Nominee) 7. Shri S N Tandan 8. Shri V M Thapar
iii)	Capital Structure of the undertaking(s) proposed to be merged/amalgamated	: Authorised Share Capital —Rs.10,00,00,000 Issued and Subscribed —Rs. 6,06,54,960 Paid up —Rs. 6,06,15,273
iv)	Present activities of the undertaking(s) proposed to be merged/amalgamated	: To manufacture and deal in glass containers, vials and pharmaceutical bottles.
v)	Brief particulars of the proposed scheme of merger/amalgamation, including the objectives proposed to be achieved	: Jg is a subsidiary of BILT. Jg's operations have not been self sustaining and it has had to depend heavily on support from BILT including cash injections and securities for Loans by way of corporate guarantees/collaterals. In addition, BILT has also extended Managerial and Marketing support for almost the entire production. Jg's operations can be made financially viable on a long term basis only if substantial funds are injected. It is therefore proposed to amalgamate Jg with BILT effective 1st July, 1988, which is in the public interest for the following reasons: 1) It would ensure the long term viability of Jg, which is not possible otherwise. 2) Provide continued employment to about 1851 people. 3) No disruption of ancillary industries, most of whom are in the small scale sector and are completely dependent on Jg. 4) Two major Public Sector Companies viz. Indian Drugs and Pharmaceuticals Limited, Rishikesh and Hindustan Antibiotics Limited, Pune, are dependent on Jg for upto 60% of their requirement of vials. These Companies are engaged in the manufacture of bulk drugs and other essential pharmaceuticals and stoppage in supplies by Jg would adversely affect operations of these Companies.
vi)	Details of the exchange ratio/consideration proposed for shareholders/creditors of the amalgamation/merged undertaking.	: Issue of one BILT Equity Share of Rs.10/- fully paid up in exchange of 20 Equity Shares of Rs.10/- each fully paid up held by Shareholders of Jg.

2. Any person interested in the matter may make a representation (in quadruplicate) to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr Rajendra Prasad Road, New Delhi, within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

For **BALLARPUR INDUSTRIES LIMITED**

The Panchayati Raj Bill

Arun Ghosh

While the motives of the government in precipitately introducing the Constitution (64th Amendment) Bill may be suspect and while some of the provisions of the bill may be objectionable, the introduction of the bill is a highly desirable development, the full implications of which may not have occurred to those who have drafted it.

NEVER mind the motives of the administration in suddenly springing, in an election year, the Constitution (64th Amendment) Bill. All governments all over the world can legitimately be expected to seek the maximum political mileage out of their legislative proposals and executive actions. Never mind that such a momentous constitutional amendment has been proposed in an election year with little national debate, and in a blatantly partisan manner. The real issue before parliament, before the country, is not the election gimmickry behind the proposals but whether the proposals are in the (longer term) interest of the country. In other words, is the proposed constitutional amendment desirable? Are there any serious flaws in the bill as presented to parliament? What should be the approach and attitude of the people generally, of the elected members of parliament, and of the state legislative assemblies, to the proposals?

Let me start by repeating the reaction of many responsible people (who are in principle in favour of greater decentralisation) to the proposal to instal panchayati raj through a constitutional amendment at this juncture. First, it is felt that in the context of the extant property relations and power structure in the rural areas, the proposed constitutional amendment will only add to the exploitative powers and capability of the elite in the rural areas. More ominously, it is felt that the proposals will take down to the villages the nepotism, casteism and corruption that we see at the national and state level. Instead of spearheading local level development through the panchayats, it is apprehended that there will emerge accentuated in-fighting and local chauvinism, which will spell an end to any national consciousness, national planning, national unity and integrity. Indeed it is possible that in the sarpanch of each gram panchayat, we are creating a large number of little Hitlers, and that this step will give a boost to centrifugal forces and militate against central, and more particularly, against state authority. It is also felt that the proposals will accentuate regional disparities in income and employment, at the same time creating fresh impediments against the migration of labour. Finally, to revert back to the first point, it is apprehended that all the gains from plan outlay will now flow to the sarpanch, his family, his friends and his supporters, thereby accentuating the unequal distribution of income and wealth in the country.

True, all the above dangers exist in some degree. Indeed, the seeds are already there; many of the current happenings in the countryside already reflect some of these tendencies. However, the question to be examined dispassionately is: are these (sometimes latent) forces which reflect casteist, religious, sectarian prejudices likely to gain support from the proposals currently mooted? Are there any possible safeguards, and if so, what are they?

Panchayati Raj and Local Power Structure

Let me first examine the question of land reform. After forty-two years of independence what is the situation in regard to land reform in the country? Apart from one or two states, land reform is not even talked about. There is, in fact, a strong body of opinion which purports to state that the green revolution having succeeded in states which have not pressed on with land reform, the need for agricultural growth rules out any further pursuit of land ceilings and of land reform; and that in fact the clock ought to be put back in the interest of encouraging capitalist agriculture. Anyhow, the short point is that the required political will to press on with land reform is today totally lacking.

Land reform, then, is not on the agenda. What is the solution? Do we, in the event, decide that in the absence of land reform, the depressed and deprived sections of the population will have a better chance of some redress for their situation from a strong centre or a strong state government? in short, do we really believe that the *status quo* is the best answer to the problems of the poor?

In pursuing the above line of thinking, we forget that with the revolution in communications, the poor are not necessarily a docile group today. If we read stories of occasional massacres of Harijans, tribals and other depressed sections of society, if we read of entire villages being rased to the ground, it is because the poor have started resisting the demands of the rich and the elite in the countryside. And on occasion, terrible reprisals are taken against them with the covert assistance of the guardians of the law. And, on such occasions, have the supposedly independent central or state authorities done anything to protect the oppressed except to send in forces to restore order after the event?

Is there any valid reason for assuming that things will be any the worse with increasing decentralisation of power and authority to the local panchayats? Is it not possible that these local (depressed) groups have a better chance of organising themselves, and of resisting the elite, in local level panchayati elections? These local groups may not be able to win an election to a distant parliament, and even a state legislative assembly. But they may be able to capture quite a few panchayats, and certainly achieve significant representation in a large number of gram panchayats. Of course, one presumes that booth capturing and similar strong-arm tactics would not be permitted; and to the extent that even the panchayati elections are to be regulated by the election commission, it is to be hoped that such tendencies would be minimised.

Let us also not forget the role of both political parties and in a few areas, of voluntary organisations. These latter are by and large locally based, each organisation in a designated district, sometimes a few blocks or even villages. They are, as of today, largely apolitical, manned by a few dedicated souls, endeavouring to bring about social and economic change in the limited areas of their operation, although there also exist a few which are really 'fronts' for the elite and the politically ambitious. But the responsibility of the political parties is patently clear. In fact, the panchayati elections—with promise of future funding of local level development through the panchayats—offer a golden opportunity to all leftist organisations. Should they not endeavour to see that the right people get elected to the panchayats? And, among other things, what they need to do is to use their local influence to ensure that the elections are free and fair, and that the right people get elected to the panchayats.

In fact, as a result of both the development of communications, and the awakening of the masses and their growing political consciousness, there is a strong possibility that a large number of really independent minded representatives of the poorer sections of the population may get elected to the gram panchayats.

Of course, one should not rule out the possibility of the elite, the landlord-cum-moneylender sections getting further entrenched in quite a few areas. Perhaps the greatest danger of that type of development comes from the Hindi heartland—Bihar, UP, Haryana, Rajasthan and Madhya Pradesh. But even in these states, the rich and the elite in the rural areas are not likley to have plain sailing everywhere. There is likely to emerge a fairly bitter struggle. The fact that Kanshi Ram could come second to V P Singh in the Allahabad parliamentary constituency, beating the Congress(I) candidate hollow, should be an eye-opener to all; there would certainly emerge many Kanshi Rams who will seize power and authority at the local level panchayati elections, if and when they take place after the constitutional amendment, that is, when the panchayats begin to wield real authority.

There would also arise conflict, bitter armed struggle in many areas. Some people would get killed. But let us face it; the oppressed in the villages are dying a slow death every day even now, frequently, a violent death. We got our political independence cheaply, and we will probably have to pay a price now, in the coming years, for achieving real democracy, for attaining economic independence for the vast masses of the people. This is probably inevitable; and let us not get overly worried if such occurrences cannot be avoided in some areas. After all, people in authority rarely give up their positions without a fight; and if the fight gets to be acrimonious, more particularly, if the fights get reported—when the daily excesses and injustice meted out to large sections of the population never get reported—we should not imagine that the end of the world (or the end of India as a democratic country) has come.

This is the broad answer to the question of the desirability of introduction of panchayati raj in the absence of land reform. We cannot wait for land reform because the extant power structure at the state level will not permit, in most parts of the country, the implementation of even the existing provisions of the statute on land ceilings and redistribution of ceiling surplus land. The introduction of panchayati raj can, in fact, help to bring about better mobilisation and organisation of the masses of people in the rural areas.

Incidentally, the political parties have a great deal of responsibility in future. It is not the Congress(I) Party alone which has lost contact with the masses; other political parties also seem to be drifting away from mass contact and mass political activity. They must change their thinking, their work procedures; they must go back and start the process of politicisation of the masses, not necessarily on the basis of highly monolithic centralised directions, but on the basis of broad overall party principles but with an eye to local needs and local aspirations. Certainly, the left parties must renew mass contact and mass propaganda, activate the masses, build up local level leadership, and guide them in the panchayati elections to come. In fact, that may well presage a major change in the character and functioning of the democratic polity of the country as a whole, and may well lead to the development of truly all-India parties at a national level, based on clear-cut economic thinking and strategies. To the opposition parties, the proposed Constitution amendment bill is an unexpected and unique opportunity which they must not let go out of their grasp.

To briefly sum up the above argument, even though the motives of the present government in precipitately introducing the Constitution amendment bill may be suspect, and even if some of the extant provisions of the bill may be objectionable, the bill may still be deemed to be a highly desirable development, the full implications of which may not have occurred to those who have drafted it. But then, after all, we are really concerned with the results, and the results only.

How does one react to the various provisions of the bill, as presented to parliament? This is where a great deal of clear thinking is necessary; and the past experience of state which have operated the panchayati raj (in varying degrees) must be brought to bear while evaluating the different clauses, and seeking either their ratification or amendment, and perhaps even some further provisions to ensure the success of the experiment.

Need for Flexibility

The first issue is to recognise the need for flexibility. In particular, the states which have already introduced panchayati raj—West Bengal, Karnataka and Andhra Pradesh, among others may be deemed to have done so on their own—should not be required to re-order panchayati elections in terms of the proposed bill. Some of the provisions of the bill are directly antithetical to the system currently in operation—with considerable success—in some states; and these should not be disturbed. One should therefore be careful about not imposing the same pattern throughout the country. The above two points may be briefly summed up as follows. First, it is not necessary for all states to have a three-tier system. This is already recognised, and there is provision that some of the smaller states need not have an intermediate tier. But sometimes they need not have panchayats at the higher or district level because some of the states are smaller than some districts in thickly populated parts of the country. For example, in Tripura—before the advent of the present Congress(I) government, which dismissed a superbly conceived panchayati system, immediately after coming to power on a wafer thin majority—there were in the past, gaon sabhas and zilla parishads (with three districts). The system was working well; and it is possible that some (smaller) states may have gaon sabhas (or gram panchayats) and block-level panchayat samitis (or mandal panchayats), without a district level zilla parishad. The present hankering for a "district government", with a district magistrate somehow keeping communication lines with the centre, has no merit; a state like Goa is virtually little more than a district after all. Thus, the proposed sub-clause 3(a) of clause 243(A) (of the Constitution) needs a specific amendment to provide the requisite flexibility.

Equally, there is little point in insisting (*vide* sub-clause 3(c) of clause 243(A)) on "members of the House of People and the members of the legislative assembly of the state representing constituencies which comprise wholly or partly a panchayat area at a level other than the village level [being automatically made members] in such panchayat". Why should a member of parliament representing, say, Faridabad, be necessarily made a member of the Faridabad (block) panchayat samiti (or mandal panchayat)? If the analogy were to be carried over to the urban areas, would it be desirable to make, say, Jagdish Tytler, representing a apart of Delhi in parliament, a councillor of the Delhi Municipal Corporation? He will have no time, and yet he would wield enormous clout, and exercise patronage in regard to the disbursement of funds or favours. Either a member of parliament is concerned with overall national matters or with purely local matters. This is an objectionable clause and needs to be deleted (even though such deletion would now be opposed by all members of parliament).

Secondly, there is no merit in uniformity being imposed on all panchayats in terms of clause 243(B) concerning the composition of panchayats. Sub-clause(2) mentions that "all the seats in a panchayat shall be filled by persons chosen by direct election from territorial constituencies in the panchayat area..." Now, in this context, let us recall that Mahatma Gandhi envisaged the successive layers of panchayats to be wholly based on indirect elections; thus gram panchayats would

send representatives to panchayat samitis and the latter would send representatives to the zilla parishads. Also, the extant legislation in West Bengal makes for a combination of direct and indirect elections; all the pradhans of gram panchayats are automatically members of the panchayat samitis; and the sabhapatis of the panchayat samitis automatically members of the zilla parishads. There are some other directly elected office bearers, but basically the composition of the successive higher bodies is based on indirect elections. There is no reason now to force a change in the system in West Bengal which has worked well. In fact, even if there is no agreement as to the desirability of indirect elections, there should be provision for flexibility—and states which have operated the panchayati system successfully should not be required to suddenly change the system and to order fresh panchayati bodies.

The same goes for the reservation of seats as per clause 243(C). For example, in West Bengal, the system has worked well so far without the type of reservation sought to be introduced; and there is no reason now for an outside authority to impose a feeling of separatism where none exists. In fact, it should be remembered that scheduled caste people/tribals are usually concentrated in certain areas; and they are bound to emerge as powerful in certain gram panchayats (or gaon sabhas). If adequate authority and finances devolve to them, that in itself would be an excellent forward step. The reservation of seats has not led in the past to the election of vocal or articulate representatives of the depressed sections of the population in any election.

There are other objectionable clauses. The Eleventh Schedule (Article 243E) is all-embracing; it is practically synchronous with the functions of the states (as laid down in the Constitution). There is need for more cogent thinking; and in this context, there is need for thinking in regard to, first, further devolution of responsibilities from the centre to the states. There is no mention of that anywhere; and the functions now envisaged for the panchayats may be too much for the latter to discharge. That could lead to confusion. For example, panchayats are to be responsible for rural electrification, including distribution of electricity. The example given above is merely indicative of the haste with which the bill has been drafted, with no very clearcut thinking as to the powers, functions and responsibilities of the panchayats, no clear idea as to the requirements of funds, of personnel, of organisational capability to discharge the functions. Thus, one has to be careful not to run to the other extreme, at the expense of all benefits of centralised planning; but then, perhaps the idea at the back of the mind of the drafters of the present bill has been to seek to establish a direct link between the centre and the districts, bypassing the state governments. This cannot be allowed to happen. We need genuine decentralisation; and, therefore, while supporting the bill generally, one must point out the deficiencies which need to be remedied, in order to make for genuine panchayati raj development.

There are two other clauses which need rethinking. First, the form of accounts and audit (Clause 243H) is to be laid down by the governor, on the advice of the CAG. But why the governor and not the state governments, as for other clauses? Secondly, the bill is not to apply to certain states and areas. Not only are the north-eastern states to be excluded, the autonomous hill districts of the north-eastern states as well as the areas covered by the Gorkha hill district council in Darjeeling are to be kept out of the provisions of the panchayati raj system. But the rationale of this policy is not clear unless the hill people are to be kept tied to the apron strings of the centre. Why should these areas not have internal democracy? Is Jamir to be the sole arbiter of Nagaland, Lalthanhawla of Mizoram and Ghising of Darjeeling? Is the centre afraid that panchayats in Nagaland and Mizoram may be captured by Vamuzo's and Laldenga's men? The rationale of the present approach is not clear. Farooq Abdullah's J and K government has passed an Act (under the J and K Constitution) ushering in panchayati raj in that state. The state has many more problems than Nagaland and Mizoram (so far); and if J and K can have panchayati raj, why not Nagaland and Mizoram? As a matter of fact, these areas have a much more democratic society and social polity than the rest of India; and they deserve funding for decentralised development much more than any other part of India.

There is one particular point on which the proposed bill should take the cue from the system operating today in West Bengal. All decisions in all panchayats (right from the gram panchayat upwards) are taken on the basis of *consensus*; and the formal position is that the majority would decide on issues which are debatable or are debated. The pradhan of the gram panchayat, though doubtless a leader, is essentially the spokesman; he may guide and influence his colleagues but he is not the sole arbiter. More importantly, all decisions of all panchayats must be hung up on the notice board of the panchayats for all to see. The accent is on 'open administration'.

The procedure has had a salutary effect on the functioning of the panchayats in West Bengal, and should be emulated, and the procedure sanctified by legislative provisions. The sarpanch should not have the sole authority over all decisions, whether as to the identification of beneficiaries of programmes or the disbursal of funds or the drawal and implementation of schemes of development. He will in any case wield greater influence than the others. More importantly, there should be wide publicity given to all decisions; information should be freely available so that decisions taken are kept under proper scrutiny by the people.

Potential for Genuine Democracy

To conclude then, perhaps it is necessary to emphasise only two points. First, no matter what the motives of the present administration in pitchforking the Constitution (64th Amendment) Bill, the introduction of panchayati raj is likely to be a good thing for the country. In fact, those who have spearheaded it may not be fully aware of the implications of what they are doing; they are bringing about conditions which would eventually result in the introduction of real democracy in the country. The process is not going to be smooth; and the vested interests will certainly endeavour to grab power in the panchayats—they may even succeed for a while in certain areas—but the masses of people cannot and will not be kept down. To that extent, this is a truly historic bill.

Secondly, the bill as at present drafted has some serious flaws. These need to be corrected; and the opposition parties need to focus on the specific lacunae in the bill, some of which have been indicated earlier. In fact, what we really need is a *minimum* set of Constitutional provisions to ensure: (a) regular panchayati elections; (b) strong deterrents to their arbitrary dissolution (of the type witnessed in Tripura recently), and in any case, the holding of fresh panchayati elections within six months, the newly elected panchayats being given a term of five years (and not merely the remainder of the term of the dissolved panchayats, as now proposed); and (c) devolution of both finances and authority successively from the centre to the states, and from the states to the panchayats. One could add that to the extent possible, indirect elections to the higher panchayati bodies should be encouraged.

All of us need to take a constructive and positive approach; and the occasion should be used for extracting the maximum of genuine devolution of authority. The bill is likely to bring about a genuinely decentralised administration provided that people are watchful, which again is the essential requirement of democracy. But with the amendments suggested and, more particularly, with continuing vigil on the part of all, the bill has the potential of bringing about genuine democracy in the country and it is to that end that we need to concentrate our attention and effort.

Panchayati Raj Bill: The Real Flaw

B K Chandrashekar

It is not the Constitution amendment bill that is the problem. It is the rest of the elements in the prime minister's package on panchayati raj that has given rise to deep-rooted apprehensions. The centrepiece of these elements is the role proposed for the collector.

THE Constitution 64th Amendment Bill introduced by the prime minister in the Lok Sabha to provide constitutional status to panchayati raj institutions (PRIs) has attracted unusually strong comments. The non-Congress governments perceive that the centre is making a new onslaught on the constitutional role and functions of the states via the proposed amendment. They are also convinced that the amendment bill is only the first step in a series that will surely follow to institute the rule of India's villages from Delhi, thus bypassing state governments. It is argued that while the prime minister and his party will commandeer their massive majority in parliament to push the inadequately discussed bill through, they will use a combination of state power and bureaucracy to control the panchayats through a new scheme of administrative and financial mechanisms (which, however, is not a part of the bill). Thus it is widely believed that the deputy commissioner or the district magistrate (DM) will be the sole focus, hereafter, both of development and law and order matters. What, then, will be the relationship between the DM and the elected panchayat at the district level? It is also feared that the centre will keep a direct hold over panchayat bodies by funding them from Delhi without virtually any reference to the state governments, thus devaluing the constitutional, political and social status of the states. Are these mere 'beliefs' or probabilities based on some evidence? What does the amendment bill itself contain? In what form, if any, can these other proposals come in? These different but related issues have all been mixed up inthe politically charged debate.

The debate, if it may be called that, on the amendment bill has confused rather than clarified issues. For example, some senior opposition leaders and reputed journalists have condemned the bill on the ground (a) that the bill enables the centre to enact legislation concerning panchayats when such a thing should be left to the state governments, (b) that it provides access for the centre to the panchayats by means of direct financing of panchayats, and (c) that the bill, in its earlier version, had empowered the governor rather than the state government to dissolve the panchayats. The bill therefore is alleged to provide the basis for centralisation of power and not for decentralisation. Above all the question has been raised: Why the constitutional amendment?

The demand to entrench panchayati raj in the Constitution has been made by experts and various official commissions on the ground that most state governments had not implemented Article 40 of the Constitution (to organise village panchayats and endow them with powers of self-government) and as a consequence PRIs had been denied resources, responsibilities and powers. It is generally agreed that the constitution must provide for (i) mandatory setting up of PRIs, (ii) holding of periodic elections to these bodies, (iii) provision of reservation for the weaker groups, and (iv) audit of PRIs' accounts.

Asoka Mehta Report

Thus the Asoka Mehta Committee (1978) recognised the need for constitutional sanction and included in its report a draft Constitution amendment bill formulated by 21 eminent citizens including E M S Namboodiripad, S K Dey, Ramakrishna Hegde, Madhu Limaye, S M Joshi, and L M Singhvi.

The draft bill made the establishment of PRIs mandatory; membership was by election and the chief election commissioner was put in charge of all election matters. The comptroller and auditor general was asked to audit the accounts and his report had to be submitted to the governor who, in turn, had to cause it to be laid before the state legislature. Panchayats could be empowered by the state legislature with executive and administrative functions including the "promotion of economic and social development and implementation of plans. . ."

A finance commission to review panchayat finances had to be set up by the state government once every five years and its report had to go before the legislature. As regards suspension and dissolution, where the governor of a state was satisfied that a panchayat was "not functioning in accordance with law or is grossly abusing its powers or is functioning in a manner which is detrimental to public interest" he could suspend or dissolve the panchayat (pp 207-212).

It was obviously not believed that such an amendment encroached upon the exclusive power of state governments to make legislation concerning panchayats ('local government' figures in the 'state list' of the Seventh Schedule to the Constitution). Nor did the bill contemplate amendment of any of the entries in the 'state' or 'concurrent' lists in the Seventh Schedule so as to transfer them to the 'union' list. Now, how does this compare with the 64th Amendment Bill?

The 1989 Bill

The bill mandates the setting up of panchayats at the village, intermediate and district levels and they will have a five-year term. Smaller states with a population not exceeding 20 lakh could do with a two-tier set up (Article 243A). The bill empowers the legislature of a state to determine the composition of panchayats (Article 243B). Members shall be elected in direct elections with one exception, namely, the legislature may provide for the membership of MPs and MLAs and chairmen of panchayats in the appropriate panchayat bodies. Seats shall be reserved for SCs and STs in proportion to their population and to the total number of seats in a panchayat institution. Similarly, 30 per cent of the reserved seats shall be reserved for women belonging to SC and ST and a further 30 per cent of the total number of seats shall be reserved for women (Article 243C).

A finance commission shall be appointed by the governor to review the financial position of the panchayats and to make recommendations regarding taxes and duties to be imposed and the basis of sharing the revenue with the state government, grants-in-aid and related matters. The recommendations will have to be laid before the state legislature.

The conduct of elections to PRIs including preparation of electoral rolls, etc, will be supervised and controlled by the Election Commission, as in Karnataka at the moment. However, it will be the

prerogative of the state legislature to enact laws to govern elections to panchayats (Article 243 I and J).

As regards accounts, the form in which accounts have to be kept will be determined on the advice of the comptroller and auditor general of India. The CAG will also arrange for the accounts to be audited and his reports to the governor will then be placed for consideration before the legislature.

Finally, it has been left to the state legislature to endow the panchayats with such powers and authority as may be necessary to enable them to function as institutions of self-government. For example, panchayats will have powers and responsibilities for the "preparation of plans for economic development and social justice" (Article 243F), for the "implementation of schemes for economic development and social justice as may be entrusted to them including those in relation to the matters listed in the Eleventh Schedule". Thus (i) a distinction is made between preparation of 'plans' and implementation of 'schemes'. In the latter case, will it then be the right of the government to formulate 'schemes' which it has no right to in the case of 'plans'? And (ii) for the first time under the Constitution, the subjects listed in the Eleventh Schedule may be entrusted to panchayats. However, it is clear that such entrustment can be made only by a state legislature and not by the centre.

The 1978 Draft and 1989 Bill

It can be seen that both in terms of its format as well as the content, the 1989 amendment bill is similar to and in several instances even identical to the 1978 bill. Whether in powers and responsibilities, the manner of elections, accounts and audit there is very little difference. The role of the CAG in presenting forms for panchayat accounts and audit can hardly be described as promoting centralisation. Indeed in Karnataka, the accountant general has been requested to audit No 2 account of mandal panchayats, i e, development expenditure. There was a lot of fuss about the powers of dissolution given to the governor in the leaked (*Indian Express*, 10.4.1989) version of the 1989 bill. There was an identical provision in the 1978 bill. The bill in its present form has deleted that provision. There need have been no fuss at all since the governor, for this purpose, could not have acted in his 'discretionary' role but only in his formal, constitutional role. He would be bound by the aid and advice of the council of ministers (Article 163). "The governor is but a shorthand expression for the state government just as the president is an abbreviation for the central government" (Supreme Court in Shamser Singh vs State of Punjab, 1974).

Can the centre enact legislation to control panchayats? I believe that the centre has no power to do so. The directive in Article 40 cannot extend to law-making except by state legislatures. The Constitution confers power to make laws under Articles 245 and 246 on both parliament and state legislatures but this is very clearly limited by the words in Article 245(1): "subject to the provisions of this Constitution". The limitation refers to the distribution of legislative powers by the Seventh Schedule, i e, by the three lists, the union list, the state list and the concurrent list. Since 'local government' and 'village administration' appear in entry 5 of the state list, only a state legislature can make laws on these matters. There are some exceptional situations which empower the centre to legislate but they are not relevant for our purpose.

The proposed amendment, therefore, represents only a generally agreed common denominator and there is nothing obnoxious in it from the viewpoint of state governments.

Collector's Rule: PRI Package

It is not the amendment bill that is the problem. It is the rest of the elements in the prime minister's package on panchayati raj that has given rise to deep-rooted apprehensions. The centrepiece of these elements is the proposed role for the collector or the district magistrate and this has to be seen in the context of the much publicised concept of district planning in which the officials will have the activist seat with a more passive role for elected representatives.

In 1987 and 1988 the prime minister held a series of five workshops of district magistrates on the theme of 'responsive administration'—a theme which was no doubt welcome from the limited perspective of the civil service. The views of these officers were further discussed by state chief secretaries and secretaries to the government of India and distilled into *a report submitted in July 1988*. It is this report that should form the basis of discussion although where and how the recommendations pertaining to the supremacy of the DM would be drafted in the form of legislation is not known as yet.

The report recommends the constitution of a unified representative body—which will be the zilla parishad—to be in charge of planning, execution and monitoring at the district level. It brings in the DM as chief executive officer of the zilla parishad while he also continues as the district boss in charge of revenue and law and order. In other words the developmental as well as regulatory functions will be concentrated in the DM. The zilla parishad will have special subject committees to provide 'guidance' to officials. The new, powerful collector's role is sought to be justified by contrasting the ugly, if democratic, conduct of politicians with that of the more service-oriented bureaucrats. "The presidentship of zilla parishad proving such a glittering prize, furious contests will develop with money and communal/caste influences overshadowing considerations of competence and commitment to social justice among the candidates, leading to the capture of the top positions by undesirable elements. This may be contrasted with the existing position where the bureaucracy might be sluggish but tries to be fair in its dealings as a rule." No further comment is necessary! How poorly they think of the people's institutions is best conveyed in their own words: "Making the collector the CEO of the zilla parishad would bring to the zilla parishad the knowledge, the experience and the influence of the collector and thereby enhance its effectiveness."

To give the DM the pride of place in the district involves several problems. It means reversing the independence of the various technical departments like irrigation, agriculture or public works that had grown out of DM's control both in the execution of works and administration of their departments. The technocrats

brought up for decades in this tradition would surely resent the new line of control. Secondly, it is crucial for the success of *democratic decentralisation* that officials including the DM accept the ability of non-officials to work the system. A study of the Maharashtra zilla parishad showed the "officials' non-acceptance of and lack of faith in the capacities and capabilities of persons elected by the people to lead and work the system under democratic decentralisation" (V R Gaikwad, *Panchayati Raj and Bureaucracy*, 1969, p 65).

The question is asked reflecting the essence of the Westminster constitutional model: what is wrong if the bureaucracy is given a pivotal position so long as policy-making rests with the elected representatives and only its implementation with the bureaucracy? However, several countries have had bad experiences with this model. "The Westminster constitution guaranteed that the elected African governments would determine policy, and the civil service implement it. The African experience stood that myth on its head, and demonstrated what now seems self-evident: to grant anonymity, secrecy and independence to senior bureaucrats ensures their dominance over elected politicians" (Robert B Seidman, *The State, Law and Development*, 1978, p 395). Against this background, the Karnataka model promoted by Ramakrishna Hegde and Nazir Sab is a bold initiative. The elected zilla parishad is supreme in both plan formulation and execution. The president of the zilla parishad, who is of the rank of a state minister, is the executive head, and the chief secretary, who is an IAS official, is subordinate to him. The DM is in charge only of revenue and law and order, and is generally junior in service to the chief secretary. Here is an attempt to restructure the bureaucracy so that its compartmented character is altered. A new equation is sought to be built between the people and the law-makers and that should be the heart and soul of democratic (as different from bureaucratic) decentralisation.

Politics of Centralisation

The acrimonious opinions that greeted the introduction of the bill—despite the acknowledged need for a revamped PR system—is reflective of a certain lack of credibility on the part of the centre. The entire gamut of opposition parties and independent observers appear convinced that the centre is inexorably pushing its policy of centralisation in a hundred different ways, violating the essence of co-operative federalism, cutting into areas of state governments' activities. A government that centralises cannot, it is argued, decentralise selectively, and that, therefore, the amendment bill on PRIs is nothing but a gigantic exercise in vote-catching.

Thus does it make sense to speak of decentralisation of functions, authority and funds to the district and lower levels without such decentralisation from the centre to the states? Why is it that no correctives have been initiated to rectify the perverse use of such institutions as the governor, the Election Commission, the powers of the president in relation to states, especially, the imposition of president's rule under Article 356? Likewise, in the realm of economic and financial relations, planning and decision-making processes have become excessively centralised while the present constitutional arrangements and practices on the sharing of taxes between the centre and the states remain highly inequitable. The centralising phenomenon is most crudely displayed in the case of the electronic media and the well reasoned campaign by the opposition led, in this case, by Ramakrishna Hegde has elicited a negative and unconstructive response from the centre.

New Encroachments

The charge as well as the fear of centralisation is reinforced by the setting up recently of the 'National Informatics Centre' at Delhi for collection of data at the block level. An officer of the centre will be placed in every district to collect and computerise information at the district level and transmit it on to NIC. Curiously enough, the district computer terminals will reportedly be manned by NIC and not by state government staff. The information so gathered will be used for preparation of 'model' district plans. For example a model plan was prepared for Almora district in UP at the instance of the centre. The next step may be the vetting of the district plans by the Planning Commission bypassing the state governments.

While centrally planned and sponsored development schemes are an important feature of centre-state relations, they were not meant to reduce the responsibilities and initiative of state governments. Yet that is precisely what happened. Way back in the 1970s the National Development Council had decided that the value of centrally-sponsored schemes would be limited to 1/6 or 1/7 of the quantum of assistance for state plans, and that they should be in the nature of experimental projects, survey and research. But while such schemes amounted to Rs 77 crore out of a total of Rs 497 crore in 1969-70 or about 15.4 per cent, in 1987-88 they amounted to 53 per cent of all the state plan schemes. For Karnataka state, in 1987-88, the figure was a staggering 103 per cent. As a result "they contribute to centralisation and inflexibility in planning; and often they distort state priorities and immobilise the state resources" (*Centrally Sponsored Schemes: An Instrument for Centralisation in Planning*, Government of Karnataka, 1988).

The Sarkaria Commission on centre-state relations was therefore obliged to observe that the schemes should be kept to the minimum and the process of decentralisation in plan formulation should be pursued seriously.

But let alone cutting down central schemes, a new one has just been started, Jawahar Rozgar Yojana, in place of NREP and RLEGP. Funds are sent directly to the DMs or chief secretaries of zilla parishad and not via the state governments. The guidelines for the scheme include who the beneficiaries should be, how they should be identified, the mode of implementation and so on thus ensuring centralisation and the rigidity that goes with it.

Is it not a crude contradiction, it is asked, that the PM wants to decentralise power to PRIs while it is totally denied to the functionaries and members of his own party? A mind and a political structure which deny inner-party democracy will never really give "power to the people", according to opposition spokesmen. After Rajiv Gandhi's celebrated condemnation of the rot and the 'power brokers' in his own party at the 1985 Congress Centenary Session in Bombay, he announced in May 1986 that organisational elections would be held in early 1987. But that year elections were put off several times and eventually any talk of inner-party democracy or of Rajiv Gandhi giving up presidentship of Congress in deference to the principle of sharing power has been the given goby.

In sum, the centre has thrown away an opportunity to develop a consensus on a matter of national concern and its credibility gap is increasing. The decentralisation process must begin with the centre shedding its powers to the states, to be followed thereafter from the state government to PRIs. The centre should desist from direct funding of panchayats. Most important, the amendment should include a provision containing the basis of devolution of finances from the centre to PRIs via the state governments. Alternatively, the Finance Commission could be empowered to make such a recommendation.

GOETZE (INDIA) LIMITED

NOTICE

It is hereby notified for the information of the public that **Goetze (India) Limited** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking. Brief particulars of the proposal are as under:-

1.	Name and address of the applicant	: **GOETZE (INDIA) LIMITED** Registered Office: H-2, Connaught Circus, New Delhi 110 001
2.	Capital structure of the applicant organisation	: Authorised Capital: (Rs. Lacs) 1,00,00,000 Equity shares of Rs. 10/- each 1,000.00 Issued & Subscribed Capital: 69,33,599 Equity shares of Rs. 10/- each 693.35 Paid-up Capital: 69,33,599 Equity shares of Rs. 10/- each, fully paid-up 693.35
3.	Management structure of the applicant	: The Company is managed by the Managing Director under the supervision, control and direction of the Board of Directors. Mr. H. P. Nanda is the Chairman and Managing Director. The Board of Directors consists of: 1. Chairman & Managing Director: Mr. H. P. Nanda 2. Vice-Chairman: Mr. Anil Nanda 3. Dr. Ing. Christian Irmler 4. Mr. Gert M. R. Goetze 5. Mr. Jin Lin Pai, Alternate to Dr. Irmler 6. Dr. G. Dittmer, Alternate to Mr. Goetze 7. Mr. L. M. Thapar 8. Mr. J. Sengupta 9. Mr. M. M. Sabharwal 10. Dr. S. M. Patil 11. Mr. J. B. Dadachanji 12. Mr. Rajan Nanda 13. Field Marshal Sam Manekshaw, M.C. 14. Mr. V. K. Srivastava 15. Mr. Charanjit Singh 16. Mr B. R. Kapoor 17. Mr P. Bhalla, Director and Secretary
4.	Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division.	: New undertaking.
5.	Location of the new undertaking/unit/division	: Backward Area in District Bulandshahr, U.P.
6.	Capital structure of proposed undertaking.	: Not applicable as no new Company is proposed to be formed for the purpose.
7.	In case the proposal relates to production, storage, supply, distribution, marketing or control of any goods/articles, indicate:	
	(i) Name of goods/article	: Potable Alcohol
	(ii) Proposed licensed capacity (in metric tons)	: 10,000 Kilo Bulk Ltrs
	(iii) Estimated annual turnover	: Rs. 6,000 lacs
8.	In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover etc.	Not applicable
9.	Cost of the Project (Rs. in lacs)	: Rs. 1,000 lacs
10.	Scheme of finance indicating the amounts to be raised from each source.	(Rs. in lacs) Loans/Borrowings . . . 600.00 Internal Accruals/Share Capital . . . 400.00 Total 1000.00

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

for **GOETZE (INDIA) LIMITED**

Business and Politics in India
A Historical Perspective

Sanjay P Thakur

Business is, of course, more than mere economic activity and it is necessary to understand the relationship between business and larger society. Report on a seminar.

AS a nation industrialises, business activities begin to provide an increasing share of the goods and services and generate more and more employment opportunities in the economy. Business, thus, ceases to be a mere economic activity and develops a social character. From this angle, an attempt to understand the relationship between business and larger society is not only desirable but also necessary. The IIMA Seminar Series in Business History, launched in 1982 by the Indian Institute of Management, Ahmedabad, has been directed to this end.

The first seminar focused on the historical evolution of business communities in India and explored the socio-cultural aspects of Indian business behaviour. The second held in 1984 sought to probe the relationship between the character of the governing structures and economic activities at different points in our history. The subsequent seminar held three years later attempted to trace the evolution of various functional strategies and structures in Indian business. Two books based on the first two events have been recognised as significant additions to historical literature. Business has a bearing on the distribution of power in society and vice versa. This was the theme of the fourth seminar in the series, on 'Business and Politics in India: A Historical Perspective' held on March 29-31 this year.

Attitudes to Business

The event began with S Ambirajan of IIT, Madras, presenting a provocative paper on changing attitudes towards business in India from ancient times up to the present. He focused on the attitudes of rulers, and of society in general towards business and also the self-image of businessmen themselves. Drawing primarily on literary sources, it was argued that the businessman held an honourable position in society well up to 1500 AD. He was occasionally seen as a miser or a hoarder of wealth but only rarely as a cheat and exploiter. By about 1800 AD, however, the business class had become more differentiated. During this period, while the petty trader became despicable, the big merchant began to exploit the artisans. The banking and moneylending community in the Mughal era, however, was an exception to the general decline in prestige and power of the business class. This was perhaps because of the nexus between the merchant princes and the Mughal nobility. The general attitude to business in the 19th and 20th century was more favourable than in the Mughal era but less so than in the pre-Mughal age. This was because the colonial legal system recognised individual pursuit of profit and sanctity of private property. The nationalist movement was not against capitalistic pursuits either.

The paper raised a number of questions of definition and methodology, many of which would recur in the course of the seminar. What constitutes business? Can the business class be treated as a homogeneous entity? What about regional variations? Can literary sources alone be a sufficient basis for generalisations? Absence of a 'view from below', i e, the peasants' view of business or the workers' view of the capitalist, was cited. At least a few participants felt that Ambirajan's assertion that the Mughal rule witnessed a sudden slump in the status of business smacked of a communal interpretation of Indian history. The general consensus, at the same time, was that the paper opened up a new and neglected area of historical enquiry.

In a paper fascinating in its sweep as well as detail Lakshmi Subramanian of Vishwa Bharati and Rajat K Ray of Presidency College examined the relations between businessmen and politics from the Mughals to the East India Company. They argued that before the beginning of the present century businessmen did not have any decisive voice in Indian politics. The sole exception was the 18th century when Mughal power declined and no dominant political power had yet emerged. The great Mughals were not dependent on the services of private bankers and the status of merchants depended entirely on the whim and fancy of the Mughal officer on the spot. In the 18th century, however, the Anglo-Bania alliance, symbolising the businessman's desire to seek the best political alternative necessary for stable business operations, was a major factor in the British conquest of India. For, the East India Company was more solvent than the Indian princes and, therefore, a more dependable client. The company initially used the vast 'hundi' network operated by the Indian merchants to support the wars of conquest, but later subordinated them to an international system of finance and trade which eventually led to the decline in the political power of Indian business.

Business Class and National Movement

A major portion of the seminar and perhaps the most stimulating one, revolved around the relationship between the business class and the Indian national movement. Of the several papers on this theme, the first one by Bhagwan Josh of Jawaharlal Nehru University set the tone for the proceedings to follow. Josh persuasively argued that the simplistic characterisation of the Indian National Congress as a bourgeois party must be discarded. With the broadening of the social base of the national movement in the 1920s and 1930s the Congress became an anti-imperialist party of the Indian people. The national movement developed two forms of anti-imperialist struggle—the constitutional and the non-constitutional mass upsurge kind. The Indian capitalist class favoured constitutional struggle, but kept aloof from the non-constitutional programmes of action. Josh suggested that despite the inner differentiations within the capitalists, they had by the 1930s developed a class identity and political vision vis-a-vis imperialism and other social classes in India. However, there was no evidence to suggest that the capitalists were able to influence the nature and course of the national movement in any direct way.

Dwijendra Tripathi of the IIMA (the seminar co-ordinator) in his paper on the same theme distinguished between the pre-Gandhi and post-Gandhi phases. During the first phase the Indian industrial class was weak, it had no conflict of interest with British business operating in India, and it was dependent on British technology and technicians. Conflict arose after the first world war as the Indian business class grew in strength. But businessmen had no intention of burning bridges with the government at a time when the threat of foreign competition was also severe. At the same time there was awareness of growing mass movements. In hindsight it would appear that after the emergence of Gandhi the industrialists followed a four-fold strategy: (1) keep aloof from the confrontationist politics of the Congress, (2) support constructive activity of the Congress to establish a claim on its gratitude, (3) influence policy formulation within Congress, and (4) act

in unison with nationalist forces in legislative assemblies and similar other forums. In support of his contention Tripathi traced the relations between the Congress and the industrialists from the 1920s up to the transfer of power and asserted that because of this ambivalent attitude the Indian industrialist class had only a marginal impact on political developments. In fact, by the time the end of colonialism was in sight, the industrialists were articulating positions similar to the Congress as was clear by the so-called Bombay plan prepared by some of the most important leaders of the Indian capitalist class, Tripathi argued.

Gita Piramal's paper on the political awareness of Bombay businessmen between 1850 and 1937 complemented Tripathi in many significant details. According to her, the Bombay capitalists had negligible interest in politics almost up to the end of the 19th century. Most of them had made their fortunes under Pax Britannica and there was a feeling of gratitude for the British. However, men like Jamshetji Jeejeebhoy were active behind the scenes, and J N Tata secretly financed the publication of Digby's book on Indian poverty. A few others too took limited interest in nationalist politics by participating in the activities of the Bombay Presidency Association, perhaps because of growing disenchantment with colonial rule under disturbed business conditions in the 1890s and the early decades of this century. However, as the national movement took a militant turn, the Bombay entrepreneurs retreated from even their limited participation in activities challenging the colonial regime. It was not until after the adoption of the Government of India Act of 1935 and the revival of constitutional struggle, Piramal argued, that the Bombay capitalists' interest in politics was revived. Several of them now stood for election to the provincial legislature and even won seats.

While there was general agreement with the conclusions of Josh, Tripathi and Piramal, their papers raised many important questions. What could be the basis of determining the character of a political party? Is it political participation, relationship with social classes, or its position on various burning issues? Why did the Left fail to hegemonise the Congress? If the dominant character of the Congress was anti-imperialist, why did it adopt anti-peasant and anti-labour stances on some occasions? At what point did the capitalists begin to visualise the Congress as the future ruler of the country? It was felt that to provide a satisfactory answer to these questions it would be necessary to look at a disaggregated picture of private capital in different regions, its relations with different groups or its position on specific issues.

A Disaggregated Picture

Three papers, in fact, attempted to do just that. The first in this category was by Kapil Kumar of the Indira Gandhi National Open University who examined the attitudes of Indian business towards the peasantry. He too agreed with the contention that the Indian capitalists sought to achieve a delicate balance between aligning with the national movement on the one hand and trying to check the threatening forces that mass nationalism inevitably released, on the other. Consistent with this strategy, the capitalist class, Kapil Kumar argued, was not averse to the controlled participation of the peasantry in the anti-colonial struggle, but sought to keep the peasant question within manageable limits. The strategies to keep the Kisan Sabha movement in check included the use of money power, support to constructive work in villages, and establishing links with the Congress right wing. After all many leading capitalists were landowners themselves and several Congress leaders received personal financial support from businessmen and had a sizeable investment in industrial units. The banning of Kisan Sabhas when the Congress ministries assumed power in the provinces can be understood in this context, Kumar averred. Doubts, however, were expressed whether he was not over-simplifying the issues and whether his analysis did not suffer from the fallacy of mono-causation, despite his rich factual data.

Another paper dealt with the attitude of the Indian business towards economic planning. Presented by Raghabendra Chattopadhyaya of IIM, Calcutta, it traced the genesis of the idea of planning, and asserted that the Indian business community played a crucial role in developing the planning concept during the two decades before 1947 and also during the formative years of the planning era. Capitalists advocating the concept of planning may appear paradoxical, but unlike the Soviet model, planning as visualised by Indian business was merely an economic method for rapid industrialisation as distinct from an instrument of the political transformation of society. Citing the Bombay plan in support of his thesis, Chattopadhyaya tried to emphasise that this document attempted to pre-empt state efforts in planning and, through it, Indian capitalists "set the limits of the domain of the state in the socio-economic field of the country" along capitalist lines.

The third paper in the category of those that dealt with specific issues was one on the role played by the Indian business in the partition of India. This was presented by Claude Markovits of the Centre National de la Recherche Scientifique, Paris, who argued that before the 1920s Indian businessmen were not divided along communal lines, though some businessmen were associated with Hindu revivalist activities. As Jinnah's campaign for Pakistan gained momentum, however, the Hindu capitalists, particularly Birla, began to realise that "the real choice was between on the one hand Pakistan and on the other hand a loose federal regime giving the Muslim provinces a large measure of autonomy...", as the Muslim League demanded. The Hindu capitalists were in favour of a strong central government, which the Bombay plan visualised. They considered Pakistan as a lesser evil and put whatever pressure they could on the Congress leadership to accept the partition. Though the paper generated a great deal of discussion, most participants felt that Markovits needed more supportive data for his thesis—a criticism to which the author readily agreed saying that his was at this stage only a preliminary analysis.

Running, directly or indirectly, through most of the papers discussed above, was the personality of Gandhi. It was, therefore, fitting that his relations with the Indian bourgeoisie were discussed in a paper presented by Bhikhu Parekh of the University of Hull, UK. Analysing Gandhi as a political philosopher rather than as a mere political activist, Parekh averred that despite his aversion to the institution of state, Gandhi by the 1930s began to view the state as the custodian of Indian civilisation. Parekh lucidly argued that neither capitalism nor socialism was an adequate category to describe Gandhi's thought and it is difficult to describe him as a supporter of either system. In practice, Gandhi developed a language of discourse between various groups in Indian society and developed the Congress as a body for creating some kind of consensus amongst various groups and sensitising them to each other's needs. Parekh, therefore, rejected the view that Gandhi was the spokesman of the Indian bourgeoisie, as has been argued by the Marxists, and pleaded that the bourgeoisie had little impact on his thoughts, politics or action. Parekh's was an interpretative paper, not based on factual details, but on content analysis of Gandhi's thoughts and utterances. Many participants naturally cited several details challenging his conclusions. The political scientist from Hull, however, stood his ground pleading that all facts in the ultimate analysis were subjective.

Politics of Business Groups

Though most of the papers were concerned with the attitude of Indian business towards nationalist politics, two dealt with the internal politics of the business groups themselves. One of these was presented by Raman Mahadevan of the Centre for Development Studies, Trivandrum, who discussed the development of business associations in colonial Madras. According to him the politics of businessmen was moulded considerably by their immediate economic interests. Business associations were not merely homogeneous interest groups. They also represented the articulation of business class identity through a process of realignments between various sub-groups. To support this contention, Mahadevan pointed out that initially South India was dominated by European business. Naturally, native business and Indian business associations were slow to develop. But the growing spirit of coalescence at the turn of the century coinciding with the Swadeshi movement, resulted in the founding of the Indian Bank and the South India Chamber of Commerce. Economic difficulties during the first world war I saw the articulation of more sectional interest groups within the Indian business community. The process continued in the subsequent period as well, resulting in the formation of several trade associations representing various interests.

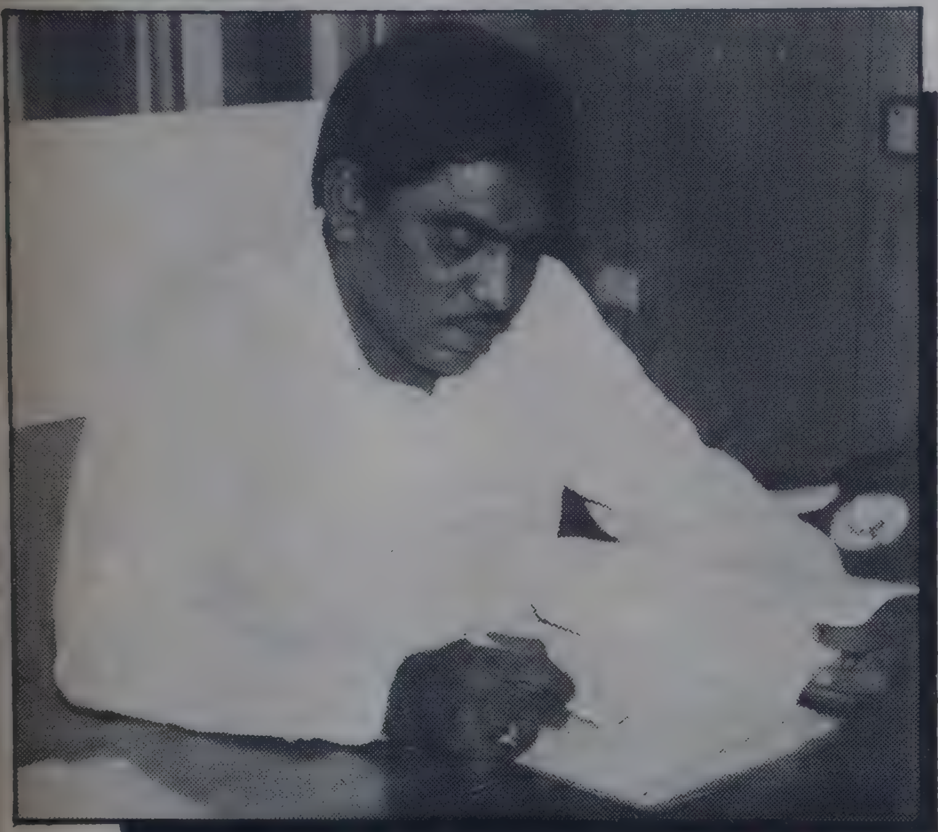
If Mahadevan's paper indicated that there ought to have been more presentations dealing with the rise of trade associations in various parts of the country, a contribution by B R Tomlinson of the University of Birmingham on British Business in India pointed to the need to study the business operations of other non-Indian interests in India. According to the author, the links between the British firms and the colonial state were complex. With regard to political alignments, the colonial administration was often criticised by colonial businessmen and they often defended 'Indian' interests against 'imperial' ones in alliance with the locals. The British expatriate managing agency houses from the late 19th century onwards succeeded because they provided the "organisational skills needed to co-ordinate India's new export-oriented primary produce sector". British subsidiary firms in their growth phase were characterised by heavy investment in management, organisation and plant. This was the basis of their success at a time when older types of expatriate managing agency firms were declining. Although Tomlinson's paper was related to the theme of the seminar somewhat indirectly it did provide a perspective for appreciating some other papers which dwelt upon the interaction between the Indian and European business interests in India and its impact on the political attitude of Indian business.

All in all, thus, the seminar was an academic exercise of very high quality. Although it did not quite exhaust the subject and some of the aspects could be discussed only partially, it underscored the need to examine more intensively a somewhat neglected subject.

ANDHRA PRADESH STATE FINANCIAL CORPORATION

5-9-194, Chirag Ali Lane, Hyderabad

Statement made at the 33rd Annual General Meeting held on Wednesday, the 28th June, 1989 by the Chairman Shri C. Ramachandraiah, MLA



GROWTH WITH CONSOLIDATION

Gentlemen,

It gives me immense pleasure to extend hearty and cordial welcome to you all to the 33rd Annual General Meeting of your Corporation. It is my pleasant privilege to inform you that your Corporation continued its momentum in its operations and attained greater heights during the year in all the key result areas. The Corporation's total sanctions crossed Rs 1,000 crores mark during the year. This is indeed a remarkable achievement in the history of any development financial institution!

The Annual Report along with the statement of accounts and auditors' report have already been circulated to you. With your permission I shall take them as read.

ECONOMIC SCENARIO:

After four successive droughts, agricultural production during 1988-89 showed a remarkable improvement. Industrial production also recorded an increase of over 9% during the year. The policy changes introduced by the Government of India for accelerating the pace of industrialisation yielded positive results. In spite of shortages in power supply in the state, industrial units also fared better when compared to the previous year. It is gratifying to note that further new oilwells have been dug in the Krishna-Godavari basin wherein oil and natural gas have been discovered and production on commercial scale is in progress. Industrial units in this region have already started utilising the oil and natural gas available. Government of India have given long over-due clearance for the export processing zone in Visakhapatnam during the year. This will give fillip to the promotion of export based industrial units in the state.

The improvement in economic conditions has helped our Corporation in stepping up its operations on a rapid pace.

OPERATIONAL HIGHLIGHTS:

During 1988-89, your Corporation sanctioned an amount of Rs 169.57 crores to 3999 applicants, recording a growth rate of 29% over the previous year and disbursed an amount of Rs 113.24 crores during the year. Your Corporation recovered an amount of Rs 84.86 crores, an increase of 22.75% over the previous year. The Corporation's sanctions, disbursements, and recoveries during the year are the highest in a single year in the Corporation's history.

Your Corporation continues to devise new policies and programmes to provide qualitative service to the entrepreneurs besides its quantitative contribution. Instant response to the growing needs of the society is essential to keep an organisation in the effective service of the people. I would like to briefly mention some of the important programmes that have been undertaken by the Corporation during the year 1988-89.

1. **Waiver of Service Charges on Tiny Sector Units:**

The Corporation waived service charges on loans upto Rs one lakh so that tiny sector units need not pay any more service charges to the Corporation.

2. The Corporation reduced interest rate by 1% for the industrial units if 50% or more of its employees are women with the objective of providing more jobs for women in the industrial sector.

3. **Assistance to Small and Tiny Sector Units:**

It is the objective of the Corporation to promote more and more small scale industrial units to provide gainful employment to a large number of people. During 1988-89 the Corporation sanctioned Rs 124.48 crores to 3776 small scale industrial units constituting 94.42% of total number of sanctions and 73.41% of amount sanctioned.

In order to help the small scale industrial units in securing working capital as well as term loans from a single source, the Corporation has started operating vigorously the Single Window Scheme. Under this scheme, assistance up to Rs 5 lakhs is provided by your Corporation. This includes loans towards working capital to the maximum extent of Rs 2.5 lakhs.

4. **Assistance to Backward Areas:**

Your Corporation has been laying more emphasis on the industrialisation of backward areas with the objective of reducing regional imbalances. During 1988-89, your Corporation sanctioned Rs 113.84 crores to 2472 units constituting 69.5% of total amount sanctioned and 68.8% of total number of sanctions in the notified backward areas of the state.

5. **Assistance to Underprivileged Sections of Society:**

Your Corporation has been striving to bring more and more persons from underprivileged sections of society into the fold of entrepreneurship. Your Corporation's special efforts have resulted in extending assistance to 690 Scheduled Caste entrepreneurs to an extent of Rs 841.3 lakhs and 130.7 lakhs to 82 entrepreneurs belonging to Scheduled Tribes.

6. **Assistance to Women Entrepreneurs:**

The Corporation lays special emphasis on extending assistance to women entrepreneurs. During 1988-89 your

Corporation sanctioned an amount of Rs 629.5 lakhs to women entrepreneurs as against Rs 355 lakhs during the previous year.

7. **Assistance to Physically Handicapped and Ex-Servicemen:**

Your Corporation during the year brought into operation special schemes meant for physically handicapped as well as ex-servicemen for promoting small industrial units.

8. **Relief Assistance to Units Affected by Riots:**

Your Corporation always rises to the occasion to meet the unforeseen contingencies being faced by its assisted units. Your Corporation sanctioned Rs 107.59 lakhs to 37 units which were damaged during the unfortunate riots in the last week of December in the four coastal districts. This assistance was to the extent of 100%, margin money being provided by the State Government.

9. During the year your Corporation introduced a new scheme for extending assistance to inland water transport vessels/barges to encourage transport through inland water.

10. **Entrepreneurs Development Programmes and Customer Meets:**

Your Corporation continues to take active part in entrepreneurship development programmes. Your Corporation has also taken initiative in organising customers meets to help the assisted entrepreneurs and solve their problems promptly.

11. **ADB Line of Credit:**

Your Corporation disbursed an amount of Rs 11.5 crores to industrial units for import of plant and machinery under Asian Development Bank line of Credit.

12. **Investment Subsidy:**

Your Corporation continued to disburse central subsidy to the units. During 1988-89 the Corporation disbursed central subsidy to the extent of Rs 706.3 lakhs. Your Corporation also disbursed an amount of Rs 21.22 lakhs towards state investment subsidy, and Rs 89.67 lakhs towards interest free sales tax loans.

PROFIT:

Your Corporation during 1988-89 earned a net profit of Rs 4.54 crores on cash system of accounting as against Rs 4.43 crores in the previous year.

RESOURCES:

During the year, your Corporation received a sum of Rs 990 lakhs from the Government of Andhra Pradesh as well as Industrial Development Bank of India in equal proportions as their share capital contribution.

The plough back of resources was Rs 535.18 lakhs during 1988-89 as against Rs 202.91 lakhs during 1987-88. Refinance from Industrial Development Bank of India during 1988-89 was drawn to the extent of Rs 6300 lakhs.

I am happy to report to you that despite resource constraints during 1988-89 your Corporation didn't resort to borrowings under new debt instrument, which is one of the costliest source of finance as the interest rate is 11.5%. In the previous year borrowings under NDI was Rs 5 crores. During 1988-89 debt equity ratio also improved from 3.25:1 in 1987-88 to 3.36:1. The debt service coverage ratio during 1988-89 also showed improvement.

PERSPECTIVE FOR 1989-90:

Your Corporation wishes to maintain the momentum in the growth rate in its operations during 1989-90 also. The Business Plan for 1989-90 approved by IDBI envisages Rs 152.5 crores of sanctions, Rs 123.6 crores of disbursements and Rs 99 crores of recovery. I am confident that your Corporation, in practice, will surpass these targets. Your Corporation not only lays emphasis on quantitative achievements but gives more importance for improvement in the quality of service being offered. Keeping this in view your Corporation has formulated the following policies for implementation during 1989-90:

Self-Employment Scheme:

In order to provide employment opportunities for educated youth, the Corporation during 1989-90 is going to operate a Special Self-Employment Scheme for First Generation Entrepreneurs.

Composite Loans:

The Corporation continues to lay emphasis on extending assistance to artisans under Composite Loan Scheme so that they could reap the benefits of industrialisation.

Single Window Scheme:

In order to provide working capital as well as term loans from a single source to small scale entrepreneurs, your Corporation gives special importance for the operation of this scheme during the current financial year.

Your Corporation proposes to conduct entrepreneurship development programmes in an intensive and effective way for speedy promotion of industrial units in the state. Special cell has already been created in the Corporation to meet this requirement.

ACKNOWLEDGEMENTS:

I am happy to inform you that your Corporation has been enjoying the full support and confidence of the Government of Andhra Pradesh and Honourable Chief Minister, Sri N T Rama Rao garu. It is my pleasant privilege to reassure the Government that your Corporation would spare no efforts in taking the state of Andhra Pradesh into the forefront of industrialisation, with special emphasis on small and tiny sector units and upliftment of underprivileged sections of society. I express my gratitude to the Government of Andhra Pradesh and our beloved Chief Minister. I wish to place on record my sincere thanks to Industrial Development Bank of India for their valuable and timely support in providing resources besides offering counsel and guidance in our operations.

I take this opportunity to express my heartfelt thanks to my colleagues on the Board for their valuable counsel and cooperation in formulating the policies and programmes of your Corporation.

I would like to express my thanks to RBI, Department of Industries & Commerce, LIC, Commissionerate of Public Enterprises, Commissioner of Industries, District Industries Centres, District Collectors, sister Corporations in the State and Commercial Banks for their active support extended to the Corporation.

It gives me great pleasure to extend my sincere thanks to Managing Director, General Managers, Officers and other employees of the Corporation for their sincere and devoted services. I compliment them for their professional approach to the job and discipline in implementing the policies and programmes sincerely which has enabled the Corporation to reach the pinnacle of success.

I am specially thankful to the shareholders of the Corporation for the interest they have been showing in the activities of the Corporation. I thank you all for sparing your valuable time and being present here today to attend this Meeting.

Now I take the pleasure of commending the Balance-Sheet and Profit and Loss Account of the Corporation along with the Directors' Report for your esteemed consideration.

Thanking you,

C. Ramachandraiah, MLA
CHAIRMAN
Hyderabad

28th June, 1989

NOTE: *This does not purport to be the report of the proceedings of the Annual General Meeting.*

Sword of Damocles over Tribal People of Andhra Pradesh

N Subba Reddy

It is necessary to delve into the intentions of the Andhra Pradesh government in wanting to allow free sale of land among non-tribals within the tribal tracts.

FOR the last two years the Andhra Pradesh government has been trying relentlessly to repeal a law enacted nearly two decades ago (Regulation I of 1970) which prohibits any transfer of land in the scheduled areas to non-tribals. While the existing regulation postulates that if non-tribals owning lands in scheduled areas want to dispose of them, they can sell them only to tribals or to the government, the present ministry wants to allow free sale of land among non-tribals within the tribal tracts.

Two arguments have been advanced by the government in support of its proposed move. One is that the non-tribals have expended a lot of labour and invested a good deal of capital in reclaiming and developing the lands in scheduled areas, and hence they should be free to sell their property in the open market without any restrictions. The second, which goes a little beyond the first argument, is a plea for even overlooking the question of the legality of acquisition of the land sought to be sold by the non-tribal if the non-tribal in question is in possession of only 5 acres of wet land or 10 acres of dry land. The implications of these arguments and the consequences of the proposed action of the government need to be carefully examined against the background of the historical necessity for successive land regulations which were enacted in the scheduled areas from time to time.

Protective legislation applicable to the tribal areas of Andhra Pradesh dates back to 1839 when the British government decided to treat the tribal areas of Vizagapatam and Ganjam districts on a different footing from the rest of the plains, and declared that the normal revenue and judicial laws would not apply to the former. Subsequently, as a result of a further realisation that the tribals needed to be shielded from the usurious moneylenders and land-grabbers from the plains, the then government enacted the Agency Tract Interest and Land Transfer Act of 1917 which prohibited transfer of land in the agency area to any one except a member of a hill tribe, unless it was permitted by an officer authorised for the purpose. The 1935 Act created excluded and partially excluded areas in respect of which the governor exercised special powers through the collector of the district. But in spite of these safeguards, land began to slip from the hands of the tribals into the hands of non-tribals. And with various developmental schemes launched in tribal areas after independence, these hinterlands became less forbidding and hence more vulnerable, leading to a faster rate of land alienation.

The growing contradiction between well meaning laws on the one hand and their uninterrupted contravention on the other, called for remedial action in independent India. The response came in the form of the Scheduled Areas Land Transfer Regulation of 1959. Apart from strengthening the main provisions of the 1917 Act regarding the transfer of lands in the scheduled areas, the 1959 regulation provided specifically for the eviction of non-tribals unlawfully occupying lands and for the restoration of the same to the tribals. The tribal tracts in some of the Telengana districts which were formerly part of the Nizam Dominions witnessed turmoil in the forties, following which some far-reaching steps were undertaken by the administration under the enlightened leadership of Grigson. Protective regulations preventing land alienation were formulated in 1946 under the title The Tribal Areas Dastur-Ul-Amal, 1356 Fasli. They received the assent of the Nizam in 1947 and became applicable to the tribal areas in different districts notified for the purpose in 1949.

After the merger of the Telengana districts with Andhra Pradesh, the Scheduled Areas Land Transfer Regulation of 1959 was made applicable to the Telengana districts also from 1963 onwards. But as the operational rules under the act were not formulated, this act remained a dead letter for nearly a decade. The cumulative discontent of the tribals led to the Srikakulam rebellion of late sixties, which jolted the government to enact a more stringent law in the form of Regulation I of 1970. It totally prohibited the transfer of lands in scheduled areas to non-tribals (whether the transferer was a tribal or non-tribal), and placed the onus on the non-tribals to prove whether their acquisition of land had been in conformity with the laws. It is this regulation which is now the target of attack by the non-tribal landholders and which the government has chosen to repeal.

Trumped-up Grievances of Non-Tribals

It needs a close examination as to who the people are that are really aggrieved by Regulation I of 1970. If any non-tribal acquired his land lawfully up to 1970, either from any non-tribal or even from a tribal with the permission of an authorised officer, his title to the land is secure. Only when the non-tribal acquired the lands against the law and without following the procedures prescribed his title comes to be questioned. Regarding freedom to sell the lands lawfully owned by a non-tribal to any one he likes, there is a counter-question to be answered. If his legal acquisition of land in the scheduled areas was itself dependent on the discretionary powers of a competent officer, cannot the latter also decide whether he can sell the land and to whom he can sell it?

There have been many conferences held by the non-tribals in Andhra Pradesh in the recent months to project their case against the protective legislation in the scheduled areas. One of their arguments is that many of the non-tribals have been living for a long time in the scheduled areas eking out a modest living off their lands. Hence they should not be barred from selling their lands to the highest bidder. But here again, there is a counter-question to be answered. If they have really identified themselves with the tribal areas, then should they not subject themselves to the same laws as the tribals? As the tribal is not free to sell his land to a non-tribal under the existing regulation, why should a non-tribal who has chosen to be a resident of the scheduled area have any more freedom than the former? A further plea is advanced in the name of poor non-tribals owning small plots of land who, in distress, choose to sell them in order to meet some of their dire necessities. In this case again, is it not undoubtedly better for them to retain the lands and raise loans by mortgaging them instead of selling them and reducing themselves to the position of landless labourers? It may be noted that by a subsequent incorporation of clause 3A (1) into the regulation of 1970, the lands legally owned by non- tribals in scheduled areas were made eligible for mortgage with financial institutions.

On an altogether different plane is the case of non-tribals who have no valid titles to the lands occupied by them in the scheduled areas. Even if they are small peasants owning only an acre of land, an illegal possession cannot be converted into a legitimate ownership just on humanitarian grounds. This does not happen even in the case of a tribal, and one has to

remember that there are many indigenous tribals not owning even a fraction of an acre.

At Utnoor, in Adilabad District, some leaders of the non- tribals put forth the most fantastic plea that they had acquired lands in scheduled areas in ignorance of restrictive laws such as Regulation I of 1970 and hence they should be exempted from its operation (*Andhra Prabha,* February 27). An MLA, Sudhakara Rao, in a letter published in *The Hindu* of February 20 made out a case that the laws meant for the scheduled areas of the coastal Andhra districts should not have been made applicable to the Telengana districts, as the latter did not previously have the category of tribal tracts with their separate laws on acquisition of lands by non-tribals. For his sake and for the sake of others who may be holding similar view, I shall quote a few clauses from the Tribal Areas Dastur-Ul-Amal of 1946:

> Without prejudice to the generality of powers conferred by sub-section (1), the rules and regulations may provide for all or any of the following matters.
>
> Prohibiting patta right in any land being given to any non- tribal in any notified tribal areas; authorising the agent to cancel or revise any title in land granted to a non-tribal in any notified tribal area during a specified period before the coming into force of this Dastur-Ul-Amal, or to order exchange of lands by way of compensation for settlement; and empowering the agent to eject any person from any land or to place any person in possession of any land in accordance with his decision.
>
> The cancellation of all sales not finally confirmed before the date of enforcement of this Dastur-Ul-Amal.
>
> Authorising the agent to extern from a notified tribal area any non-tribal if, for reasons to be regarded in writing, he is satisfied that his presence in such area is likely to be detrimental to the interest of tribals.

Face behind the Mask

Now we should try to look at the real face behind the mask. Notwithstanding the protective regulations which adorned the statute book for several decades, lands in the scheduled areas continued to pass into the hands of non-tribal exploiters. The greater part of land alienation occurred after the forties. The glaring fact that strikes one is that even according to the official records, 55 per cent of cultivable area in the scheduled areas of Andhra Pradesh is now in the hands of non-tribals. And in the vast majority of cases, the non-tribals acquired the lands not in conformity with the laws but by jumping the legal hurdles. They must have made use of every kind of subterfuge and underhand device, ranging from forgeries, cooked up records, physical violence, deceit, blackmail and bribery. Case studies illustrating all these processes of land alienation have been brought out by field researchers who investigated the problem in these areas. More inscrutable than others, there is the technique of benami holdings whereby a big non-tribal landholder holds several patches of land in the names of different poor tribals and non-tribals who are actually dependent on him as tenants or farm servants.

There are some cases of non-tribal landlords who own thousands of acres of fertile land in the scheduled areas. Some of the lands owned by these big landlords are within the command area of well developed irrigation systems. The moment the ban is lifted on the transfer of lands to non-tribals, there will be a flood of non-tribal immigrants trying to buy up the lands in the scheduled areas. The land values would sore, and even tribals will be tempted to sell away the remnants of their holdings. If the vested interests can now persuade the government to change Regulation I of 1970 so as to permit free sale of land among non-tribals, they need only just a little more time to push the government further and secure further liberalisation of laws so as to enable them even to purchase the lands of tribals. Of course, always there will be a handy humanitarian argument that the poor peasants have to sell their lands to meet their pressing needs. This is the actual game and even if a minor amendment is now made, it will serve as the thin end of the wedge.

Another mysterious operation which is going on in the name of development activity refers to the land survey and settlement. While one wing of the government is trying to investigate and establish the legality of land held by the non-tribals, the survey and settlement staff are trying to confer pattas on the basis of present occupancy. Elementary wisdom requires that the settlement operations should wait until the legality of possessions under the regulation of 1970 is established beyond doubt in all cases of non-tribal holdings.

Role of Tribal Advisory Council

Hand in glove with the vested interests, the government of Andhra Pradesh has been understandably impatient to do a good turn to the Telugu region by erasing the very category of tribal area from its map. There was one procedural hurdle in their way, that is, securing the concurrence of the Tribal Advisory Council (TAC) which is a prerequisite for any legislation affecting the scheduled areas as per the Fifth Schedule of our Constitution. The restlessness of the government until it achieved this objective could be gauged by the fact that the TAC was convened five times between December 1987 and December 1988, while the average frequency of its meetings was only once a year previously. In the first four meetings, the TAC could not force itself to agree with the government's proposal. At the fourth meeting held on March 29, 1988, the TAC made what appeared to be a big concession in recommending that in the case of non-tribals having to dispose of their lands, under unavoidable necessity, the government may purchase them at the market value (as distinguished from what is prescribed under the land ceiling act). But this did not satisfy the vested interests or their instrument, the government. Decisive pressure was brought to bear on the TAC by the chief minister by convening a meeting of the floor leaders of all the parties on April 9, 1988 and obtaining their approval for the repeal of Regulation I of 1970. (Later on a spokesman of the CPI(M), Balagangadhara Rao, gave a statement to the effect that his party did not support the repeal of the regulation but had only suggested a minor amendment to the effect that small peasants among the non-tribals living in scheduled areas may not be evicted.) Following some criticism in newspapers and journals and more importantly, the judgment of the Supreme Court delivered on July 14, 1988, upholding the regulation of 1970, the government held its hand for a while. A few paragraphs from the judgment of the Supreme Court are worth quoting in this context.

> With the advent of the non-tribals in the late 19th century and early 20th century, the lands changed hands from tribals to non-tribals. This change of ownership was a result of exploitation arising: (1) in the context of moneylending operations, and (2) in the context of dubious and unconscionable dealings in the course of trade. A legislation which in essence and substance aims at restoration to the tribals of the lands which originally belonged to the tribals but which passed into the hands of non-tribals in the aforesaid background certainly can't be characterised as unreasonable.
>
> In the first place should lessons not be drawn from past experience to plug the loopholes and prevent future recourse to devices to flout the law? The community cannot shut its eyes to the fact that the competition between the tribals and the non-tribals partakes of the character of a race between a handicapped one-legged person and an able-bodied two-legged person. True, transfer by non-tribals to non-tribals would not diminish the pool. It would maintain *status quo.* But is it sufficient or fair enough to freeze the exploitative deprivation of the tribals and thereby legalise and perpetuate the past wrong instead of effacing the same? As a matter of fact it would be unjust, unfair and highly unreasonable merely to freeze the situation instead of reversing the injustice and restoring the *status quo ante.*

There was a deceptive lull for about eight months, after which the government struck again with renewed determination, and wrested the concurrence of the TAC for the repeal of Regulation I of 1970 on

December 23, 1988. What exactly happened at the meeting of the TAC on that fateful day is a matter of controversy. According to the magazine, *Sunday*, (March 12-18, 1989), of the 12 tribal MLAs, six were not present at the meeting and among those who were present, three did not support the government's proposal. [These three were said to belong to the Congress, CPI(M) and CPI(ML)]. Three official members are reported to have spoken against the repeal of the regulation. In that case, the government proposal could not be said to have been endorsed by the TAC. There are also other versions of the proceedings on that day. One version is that when an MLA agreed to support a minor amendment but not total repeal of the regulation he was wrongly counted as a supporter of the government proposal. My own understanding is that there were 10 tribal MLAs present at the meeting of the TAC, barring the minister for tribal welfare. Of them, three were from the plains, that is, those who do not represent the scheduled areas and who are not affected by the laws applicable to those areas. Among the remaining seven who represented the scheduled areas, four gave their assent for the repeal of the regulation of 1970. Two opposed the proposal while another was in favour of a minor amendment and not wholesale repeal of the regulation. Four official members spoke against the repeal of the regulation. In that case, it would be wrong to conclude that the TAC clearly endorsed the proposal to repeal Regulation I of 1970. It was not clear whether a formal vote was taken or an assumed consensus was recorded. How even a few tribal representatives could support such a proposal is an altogether different story which highlights the tragic process by which the traditional morality of the tribals is traduced and the immorality of present day politics is transplanted among them.

FIFTH SCHEDULE AND GOVERNOR'S DUTIES

Besides questions of morality and the niceties of voting, there are serious issues of law bearing on the composition and functions of the TAC. The provisions regarding the TAC are adumbrated in the Fifth Schedule of our constitution. Article 4 (2) of Part A of this schedule reads as follows: "It shall be the duty of the TAC to advise on such matters pertaining to the welfare and advancement of the scheduled tribals in the state as may be referred to them by the governor." One should underscore the words 'welfare and advancement of scheduled tribes' in this clause. The proposal to repeal the regulation of 1970 can, by no stretch of imagination, be interpreted to pertain to the welfare and advancement of the scheduled tribes. How could the TAC be called upon to advise on a measure which in effect is meant to advance the cause of non-tribals? How could the Tribal Advisory Council become a non-tribal welfare council and how could the tribal representatives become the champions of the non-tribals?

A more basic question is whether the meeting was convened by the governor as prescribed in the Fifth Schedule of the constitution. It should be noted in this context that while, as far as the larger part of the state is concerned, the governor is supposed to be guided by the council of ministers, in regard to the scheduled areas, the Fifth Schedule of the constitution confers special powers on the governor which are discretionary and independent of the advise of the ministry. Clause 4(3) of Part A of the Fifth Schedule states that the governor shall make rules regarding the constitution and procedures of the TAC. According to the previous clause, it is the governor who can refer any matter to the TAC for advice regarding the welfare and advancement of tribes. As a matter of fact, some years back it was the governor who presided over the meetings of the TAC. Somehow this constitutional obligation of the governor came to be informally delegated to the ministry.

That the governor has discretionary powers, independent of the ministry in performing the functions specified in the Fifth Schedule is categorically expressed in Clause 5(1) of Part A which reads as follows: "Notwithstanding anything in this constitution, the governor may by public notification direct that any particular act of parliament or of legislature of the state shall not apply to a scheduled area or any part thereof in the state, or shall apply to a scheduled area or any part thereof in the state subject to such exceptions and modification as he may specify in the notification, and any direction given under this special paragraph may be given so as to have retrospective effect." The special position of the governor in respect of the scheduled areas becomes more clear when we look back at the excluded and partially excluded areas in the 1935 Act, which provided the model for the Fifth Schedule of our constitution. One of the clauses in the Instrument of Instructions to the Governor dealing with his special responsibilities in regard to the weaker sections of those areas, reads: "He should normally be guided by his ministers, unless in his opinion so to be guided would be inconsistent with his special responsibilities and with the proper discharge of any functions which he is otherwise, under the act, required to exercise in his individual judgment."

So here is a case where the governor allowed the ministry to usurp his discretionary powers. Even assuming for the sake of argument that the intentions of the governor and the ministry are one and the same on this issue, still constitutional formalities cannot be replaced by consensual informalities. What is more impor-

tant is that the governor and the ministry should have carefully assessed the consequences of intended action.

Confusion and Chaos

The acts of commission and omission committed by the Andhra Pradesh ministry have created utter confusion with the possibility of disturbing the peace in the scheduled areas. The prevailing situation warrants that the governor should be called upon to send a report to the centre as per Clause 3 of Part A of the Fifth Schedule which says: "The governor of the state having scheduled areas shall annually or when required by the president, make a report to the president regarding the administration of the scheduled areas in the state, and the executive power of the union shall extend to the giving of direction to the state as to the administration of the said areas." Following the meeting of the TAC on December 23, 1988, the chief minister gave a statement that the regulation of 1970 should be deemed to have been repealed. The legal absurdity of a deemed repeal of a regulation without an ordinance or an act of the legislature is too patent to need any comment. What is of material importance in this context is the message it is expected to convey to the administrators and the citizens of the scheduled areas.

Here is a situation where the government is contriving to achieve without going through the trouble of legislative action what under the constitution cannot be achieved otherwise. It may be added that this bizarre situation had its origin in a small measure in an executive order passed in 1979. It has been allowed to continue in spite of the corrective administered by the high court. In 1979 the government of Andhra Pradesh passed an order directing the officers not to evict the non-tribals from the lands unlawfully occupied by them in the scheduled areas, if the extent of their possession was less than 5 acres of wet land or 10 acres of dry land. The high court struck down that order with strictures. But from that time until now succeeding governments have not found it fit to formally repeal the order. All that was done was to inform the officers concerned of the high court judgment which left the situation vague and uncertain. Now to add to it, the chief minister has publicly stated on January 24 that the regulation of 1970 should be deemed to have been repealed. In his view, obviously, a *de facto* repeal of an act of legislature occurred the moment he uttered it, whatever might be the position *de jure*. The force of this make-believe performance could be seen from the way it prompted the Hyderabad columnist of *The Hindu* to write an article in which he stated, in no uncertain terms, that the regulation had been repealed (*The Hindu*, February 3, 1989).

What import does this have for the administration in the scheduled areas? The officers who are supposed to enforce the operational provisions of Regulation I of 1970 such as investigation into legalities of land ownership and eviction of unlawful occupants are obviously feeling perplexed. The non-tribal landholders are openly telling the officers that their efforts to investigate and evict them would be in vain as their possessions are going to be regularised with retrospective effect. At a place called Mulug in the Warangal district, an officer who served notices on non-tribals was assaulted recently. A few weeks back the project officer of the Integrated Tribal Development Agency at Utnoor was accused of going against the views of the government because he wanted to strictly enforce the existing regulations. He had to publicly explain his stand that as long as there was a law, it was his duty to administer it. The crux of the matter is that there is ever so much more to be done if the objective of Regulation I of 1970 is to be achieved. The magnitude of the problem can be judged by the fact that while 39,044 cases of non-tribal occupation of lands in the scheduled areas had been detected by February 1983, the number had gone up to 54,101 by September 1988. This problem needs vigorous action. But it is this very process that is being indirectly balked by the officially contrived impasse.

The confusion and chaos that is now being witnessed in the administration of the scheduled areas of Andhra Pradesh should be enough cause for the governor to initiate discretionary action in accordance with the provisions of the Fifth Schedule. The governor should consider taking the following steps immediately: (1) To reconstitute the statutory TAC so that it includes only representatives of the scheduled areas because the TAC has a constitutional nexus only with the scheduled areas. (There can be another informal advisory body for the scattered tribes.) (2) To convene and preside over the reconstituted TAC and ascertain its views on matters relating to the welfare and advancement of the tribals and not the welfare and advancement of non-tribals. (3) To send a report to the president on the situation prevailing in the scheduled areas as a consequence of the ministry's efforts to repeal the protective laws and ask for necessary directive from the Union to the chief minister not to repeal the Regulation I of 1970 and on the other hand to instruct the officers not to grant new pattas to non-tribals in scheduled areas until investigations under Regulation I of 1970 are completed. (4) To be prepared in the last resort to declare under Clause 5(1) of the Fifth Schedule that any retrogressive legislation, if enacted by the legislature, will not be applicable to the scheduled areas.

If the ministry continues to be adamant and initiates retrogressive legislation and if the governor is unable to act promptly and ward off the danger, should the country watch the tragedy helplessly and be a dumb witness to the unceremonial burial of the Directive Principles and the Fifth Schedule of the constitution? What do life, liberty and freedom from external exploitation, and educational and economic advancement guaranteed by Article 46 mean for the tribals of Andhra Pradesh? If the Fifth Schedule cannot come to the rescue of the tribals in Andhra Pradesh, then everyone interested in tribal welfare should plead, in the name of the Sixth Schedule, for the constitution of autonomous district councils in the hilly tracts of tribal concentration within the state. The scheduled areas of Andhra Pradesh have a population of about 21 lakh, of which about 13 lakh are tribals. There may be justification for redrawing the boundaries of scheduled areas here and there as some non-tribal leaders have pointed out. It will be better if the scheduled areas remain compact with majority tribal populations and have self-governance and autonomy of their own, without being swamped by a large number of exploitative non-tribals living in their midst.

The history of tribal development in north-eastern India indicates that remarkable achievements have been possible under a system of self-governance by the tribal people. One striking example is that of Arunachal Pradesh which had the lowest level of literacy in the country at the time of independence, but has now come to approximately the average literacy level for the whole country. In contrast, the tribes of Andhra Pradesh have a literacy level of 7.8 per cent, the lowest among the tribal population in any state in the country. Hence in the present circumstances, with the attitude of Andhra Pradesh ministry being what it is, there is no future for the tribals unless administrative autonomy is ensured for the scheduled areas. As for the rest of the tribals living in small pockets amdist the other population, their problems need to be dealt with on a different level. In any case the AP ministry, the governor and the union government should not, by their acts of commission and omission, drive the tribals to the desperate conclusion that only violent action can ward off their doom.

Britain's 'Ten-Year Itch' under Thatcher Administration

T V Sathyamurthy

The changes that are likely to follow the Tory debacle in the 1989 European election will almost certainly weaken the Thatcher government. Whether or not the Labour Party will be ready to take over will depend on its capacity to consolidate the gains already achieved and to put together a viable package aimed at undoing some of the major damages inflicted during ten years of purblind Toryism.

THE lady is still not for turning. But the political tide seems set for turning, at long last away from the Tories, though not yet decisively in the direction of a refurbished Labour. Already, prior to the local elections in May, the British economy was showing signs of geriatric fatigue caused mainly by the strains imposed upon the monetarist strategy of the government which had come to be focused on the essentially divergent ways of the prime minister under the influence of Sir Walter Allen on the one hand, and, on the other, her chancellor of the exchequer.

The differences between the prime minister and the chancellor go back to the weeks immediately following the presentation of the 1988-89 budget in parliament. A government which had ridden to power on the strength of the promise that it would keep inflation down even at the cost of rising unemployment had, within nine years in office, reached a stage at which it had shown itself to be unable to prevent a resurgence of inflation against a background of falling unemployment. The chancellor's approach to the mounting difficulties faced by the economy has rested on bringing the British economy more in line with the European Community, with the aim of integrating it with the European Monetary System as soon as practicable, thereby eliminating the need for a strong pound as a factor affecting the economy. The prime minister's attitude to the question of exchange rate, tactic of combating inflation by putting up the bank base rate and interest rates, and the vexed question of Britain joining EMS have been increasingly at odds with the chancellor's general approach to what he sees as the immediate problems confronting the economy.

Repeatedly papered over by statements from Margaret Thatcher unconvincingly defending Lawson, their differences have festered during the last twelve months or so as the economy has showed fewer and fewer signs of responding to the chancellor's nostrums applied in the face of the prime minister's scarcely concealed doubts about their rightness or efficacy. Inflation, the great enemy of the British economy, which the Tories claimed they alone knew how to defeat, is once again looming menacingly and defiantly on the political horizon.

It would appear that the prime minister's political instinct deserted her when she decided to embark upon a policy of striking a discordant note on the question of Britain's alignment with the rest of Europe in respect of the progress toward a united Europe leading up to the opening of the next big chapter of integration in 1992 under the provisions of the Single European Act. The differences between the pro-European elements in the Tory Party and the anti-Europeans led by the prime minister herself became more and more pronounced during the months leading up to the recent general election to the Strasbourg parliament. Over the months they have come to be lodged at the very heart of the cabinet itself, with the foreign secretary and the chancellor preferring a more co-operative stance on Britain's part towards European integration (at least the economic side of it, if not yet the political side involving such issues as 'no border checks'), in opposition to the prime minister's open hostility to what she derisively dismisses as the Brussels bureaucracy and socialism through the European backdoor. During the weeks prior to the European election, the prime minister was strident in her condemnation of the 'social charter' embodying the rights of workers which the new parliament is vigorously and enthusiastically poised to adopt.

In sharp contrast to the disarray in the Conservative Party over the government's policy on Europe (often obfuscated by the contradictory lines pursured in public by the prime minister and Heath, her Tory predecessor, into a personal conflict), the Labour Party has been able to overcome its earlier chauvinism and forge a united outlook on Europe and what needs to be done about it as Britain approaches 1992. It was only in November 1988 that Labour was still in the doldrums, apparently lacking a sense of direction and coherence of outlook, and shattered by the defeat that it suffered in the parliamentary by-election for Govan where victory was snatched from it by the Scottish Nationalists in one of the biggest electoral upsets of post-war history. Since then, the Labour Party has re-grouped itself into an effective opposition, partly by taking advantage of the increasingly beleaguered position in which the government is finding itself in relation to the economy, but mainly by putting together a far-reaching and comprehensive 'policy review' in the form of a set of policies embracing the sphere of government as a whole—from defence and foreign affairs to economic, welfare and European matters—effectively providing for the first time a credible challenge to the government's policies, by now somewhat ragged at the edges.

Political observers have been well placed to evaluate the impact on the electorate of these big changes under way in the strategies adopted by government and opposition through the results of the local elections in May and the European parliamentary election of June held simultaneously with the parliamentary by-elections to the Vauxhall (London) and Glasgow Central (Scotland) constituencies. Despite the fact that Labour's new policy has been arrived at by ditching the 'old consensus' between the left and the rest of the party in favour of 'pragmatic' policies reflecting 'reality' on the ground, there was a fear in the early stages of its public unveiling that it might misfire by being mistimed. In the event, however, the high risk strategy of labour presenting its new policy to the electorate in advance of, rather than after, the European election would appear to have paid off. For the first time in the ten years of Thatcher government, three successive electoral events, spread over a period of six weeks, have demonstrated that the new surge of support for Labour is holding and by the same token, opposition to the Tories shows every sign of intensifying rather than abating. Labour may well have installed itself in British politics during the Thatcher era as a credible alternative to the ruling party.

In both the by-elections, Labour has won convincing victories. Its performance at Glasgow Central, where the main rival was the Scottish National Party (SNP), has once again brought it to the centre of Scottish politics as the most reliable barometer of Scottish opinion on devolution within the national and European contexts. Despite a slight reduction in the proportion of total votes polled, labour was well ahead of SNP, leaving the Tories far behind. The ghost of Govan had thus been laid, at least for the foreseeable future. In Vauxhall, where the Labour

Party was at odds with the constituency organisation by imposing Kate Hoey as the candidate, an independent black labour candidate was rejected by the electorate. The Vauxhall victory against Tories and local dissidents alike, was of an even higher order than the victory at the Glasgow Central hustings.

If Labour's victories at the by-elections to relatively safe seats—overcoming minor minefields in the form of SNP's all out attack in Glasgow Central against both the main parties using as a major plank its plan to campaign against payment of the hated 'community charge' and against the aggrieved and defiant black sections of the constituency party in Vauxhall—was not a convincing enough proof of its resurgence, the results of the European elections demonstrated that labour's new political reach went beyond regional divisions and was fast extending to cover the country as a whole. It made solid gains not only in the hinterland of the north and in Scotland (where, except for Ewing of SNP, all the seats went to Labour), but also won surprising victories in the south and in the London area displacing Tories by large and convincing margins.

The Labour campaign contrasted sharply with the Conservative campaign both in style and in substance. It was entrusted to Bryan Gould, himself a latter-convert to the community, whose packaging of Labour policy in the 1987 general election had attracted much admiration even among the Tories. He orchestrated a powerful campaign urging the electorate that Britain's place was in Europe which it ought to enter without any moral reservation. Labour's support for the European 'social charter', entry into the European Monetary System (EMS), and systematic progress towards a single economic and political Europe, put the divided Tory Party on the defensive.

The fact that the prime minister herself led the 'anti-European' camp in the ruling party completely undermined the Conservative campaign. At the same time, the all but unseemly quarrel between neighbours on Downing Street, and the timing of the Spanish government's decision to take the peseta into EMS with effect from June 19 (thus leaving out only the Greek drachma, the Protuguese escudo and the British pound) highlighted Britain's isolation in a crucial sphere of European integration.

The shrillness with which Margaret Thatcher chose to arraign the 'Brussels bureaucracy', 'European socialism', and the 'social charter' had the effect of leaving Tory voters, already dissatisfied with her style of government, indifferent to the issues raised by her on the one hand and 'pro-European' Tories on the other, positively angry. Among Tory MEPs, several including Lord Plumb (the outgoing president of the parliament) openly opposed Margaret Thatcher's stand on Europe. All in all, the Tory campaign during the 1989 European parliamentary elections was in a shambles. The Tory election broadcast on the eve of the polls was widely regarded as revealing a positively menacing feature of the Thatcher government beating an enforced retreat from the citadel of power. By comparison with the substantial rift in the inner circles, the public spectacle of the prime minister and her Tory predecesor quarrelling like Kilkenny cats over Europe was a mere diversion. The leader of the opposition was in a position to derive maximum political advantage by turning the patriotic table on the prime minister and characterising her 'anti-British' in a many-nuanced sense of that epithet!

With a voter turn-out of 35-40 per cent (varying from region to region and constituency to constituency), Labour won 40.2 per cent of the total vote (over 6 million) against the Conservative Party's worst electoral performance during this century (and worst but one performance in the entire history of elections in the country) polling 34.1 per cent (5.2 million). Disgruntled Tory voters (especially in the south) either stayed away from the polls or cast their votes for the Green Party (rather than, as in the past, the Liberals or SDP), thus signalling that their disapproval of the regime stemmed as much from their disillusionment with its domestic as from its European policies. Whilst the bottom of the traditional centre in British politics was thus knocked out, the Green Party came of electoral age by winning the third place in the national count by polling 14.99 per cent of the total votes cast (2.3 million).

Britain's manifestly unfair 'first past the post' system (in contrast to the more robust variations of 'proportional representation' practised on the continent) produced the absurd result of the Greens not obtaining a single seat in the European parliament, thus taking the struggle for fair and equitable representation one step further even in this anomalous bourgeois parliamentary democratic system. In Scotland and in Wales, not a single Tory MEP was returned.

For the first time, too, the Tory Party has fallen short of being the party of the south, whilst it has failed to make any new gains in the north of England. With 45 MEPs returned to Strasbourg, Labour has gained 13 seats and is all set to play a substantial part in the socialist bloc of the parliament as well as in the coalition involving it and the Christian Democrats. With 32 seats (13 down from its previous strength), and with several European groups belonging to the centre-right coalition deserting the ship to join forces with the Christian Democrat-led group in the new parliament, the British Tory contingent in Strasbourg (along with a few stragglers such as the two solitary Danish Conservative MEPs) is doomed to present a sorry spectacle of a spent force witnessing changes which it can do nothing to stop.

The changes that are likely to follow the Tory debacle in the 1989 European election will almost certainly weaken the government. Short of a miracle, the road that Margaret Thatcher has taken can only lead to political oblivion. The invincible 'Iron Lady' is poised to lead her flock to its next electoral doom, this time in the national setting of a general election in 1991 or 1992. Whether or not the Labour Party will be ready to take over will depend on the capacity that it brings to the task of consolidation of gains already achieved and of putting together a viable policy package aimed at undoing some of the major damages inflicted during ten years of purblind Toryism of the worst kind that has plagued Britain during this century.

SPCL

SUMITRA PHARMACEUTICALS AND CHEMICALS (SPCL), incorporated in 1988, is promoted by Ramesh Jain, B D Jain and Suresh Kumar. SPCL is setting up a Bulk Drug Project to manufacture Ibuprofen and Mebendazole. SPCL has been licensed to manufacture 2,000 tonnes per annum of Ibuprofen and 500 tonnes per annum of Mebendazole. Initially, the plant is being set up to produce 300 tonnes/annum of Ibuprofen and 50 tonnes/annum of Mebendazole in Medak district of Andhra Pradesh, a notified central backward area. The technical know-how and detailed engineering for the project will be provided by Threelinga Technical and Management Consultants.

The project cost has been estimated at Rs 615 lakh and is proposed to be financed as follows: Equity: promoters—Rs 107 lakh, public—Rs 308 lakh; term loans—Rs 200 lakh. The project has been appraised jointly by SBI Capital Markets and State Bank of Hyderabad. The company has received the Controller of Capital Issues consent for the proposed public issue, with a reservation for preferential allotment to: non-resident Indians and persons of Indian origin residing abroad on repatriation basis—Rs 123.20 lakh, SBI Capital Market—Rs 20.00 lakh, and employees (including Indian working directors/workers of the company—5 per cent of the total issue.

Schedule 'B'

1. **Basis of accounting:**
The foregoing financial statements have been prepared in conformity with generally accepted accounting principles and conform with the practices within the banking industry.

2. **Head Office administrative expenses:**
The head office administrative expenses have not been debited to the profit and loss account but the bank proposes to claim the same for tax purposes.

3. **Investments:**
Investments are valued at cost. The total market value of quoted investments exceeds the cost.

4. **General:**
(a) Previous year's figures have been regrouped where necessary.
(b) Previous year's figures are not comparable as the financial statements are prepared for a period of 15 months due to amendment to the Banking Regulations Act, 1949.

5. The Income tax department has preferred appeals to the higher appellate authorities against the appellate orders in favour of the bank. The contingent liability on this account is estimated at Rs. 95.45 lakhs.

As Per Our Report of Even Date.

Auditors' Report

We have audited the Balance Sheet of the Bombay Branch of The Mitsui Bank Limited as at 31st March, 1989, signed by us under reference to this report, and the relative Profit and Loss Account of the Bombay Branch of the Bank for the fifteen months ended on that date with the books of account maintained and produced to us at Bombay.

In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of the Companies Act, 1956, the Balance Sheet and Profit and Loss Account, together with the notes thereon are not required to be and are not drawn up in accordance with Schedule VI to the Companies Act, 1956. The accounts are therefore drawn up in conformity with Form 'A' and 'B' of the Third Schedule to the Banking Regulation Act, 1949.

We report that:-

(a) we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purpose of our audit and found them to be satisfactory;

(b) the transactions which have come to our notice have been, in our opinion, within the powers of the Bombay Branch of the Bank;

(c) in our opinion, proper books of account as required by law have been kept by the Bombay Branch so far as it appears from our examination of those books;

(d) the abovementioned Balance Sheet and Profit and Loss Account of the Bombay Branch of the Bank dealt with by this report are in agreement with the books of account;

(e) in our opinion, and to the best of our information and according to the explanations given to us, the accounts together with the notes thereon, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies, and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Bombay Branch of the Bank as at March 31, 1989 and the Profit and Loss Account gives a true and fair view of the profit of the Bombay Branch for the fifteen months ended on that date.

NOTES FORMING PART OF THE ACCOUNTS AS OF MARCH 31, 1989

1. There is a contingent liability for rent on the branch premises as at March 31, 1989 of Rs. 13.23 lakhs (net of tax of Rs. 24.57 lakhs), including Rs. 3.15 lakhs (net of tax of Rs. 5.85 lakhs) accrued during 1988-89. This liability would crystallise should the sale of the concerned premises to the bank not take place by February 29, 1994.

2. As per the bank's practice, the provision for bad and doubtful debts maintained at the Bombay Branch is debited to the Profit and Loss Account of the Head Office, except to the extent of the interest income credited to the Interest Suspense Account in the Bombay branch books.

3. Income tax disputed and in appeal aggregates to Rs. 75 lakhs. There is a further Rs. 71 lakhs income tax on similar items for those years where assessments are pending. Pending the outcome of appeal proceedings, the said sums have not been provided for.

4. The bank's policy is to account for Head Office charges in the branch's books when and to the extent Reserve Bank of India permits their remittance.

5. In computing market value of unquoted investments, book value of such investments has been taken into account.

6. Assets and liabilities in foreign currencies are converted at the rates prevailing as of March 31, 1989.

7. Figures of the previous year have been regrouped to the extent necessary. However, as the Profit and Loss Account for the current period is drawn up for fifteen months ended March 31, 1989 corresponding figures for the previous year ended December 31, 1987 are not wholly comparable.

BOMBAY BRANCH

AUDITORS' REPORT

AUDITORS' REPORT ON THE ACCOUNTS OF THE INDIAN BRANCH OF ABU DHABI COMMERCIAL BANK LIMITED UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949.

1. We have audited the attached Balance Sheet of the Indian Branch of Abu Dhabi Commercial Bank Limited, incorporated in Abu Dhabi, as at 31st March, 1989 and also the Profit and Loss Account annexed thereto for the fifteen months period ended on that date.

2. The Balance Sheet and the Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulation Act, 1949, read with Section 211 of the Companies Act, 1956.

3. We report that:

(a) we have obtained all the information and explanations to the best of our knowledge and belief which were necessary for the purposes of our audit and have found them to be satisfactory;

(b) the transactions of the Indian Branch of the Bank, which have come to our notice, have been within their powers;

(c) in our opinion subject to non-provision of accruals vide paragraph 3(e) below, proper books of account as required by law have been kept by the Indian Branch of the Bank, so far as appears from our examination of the books;

(d) The Balance Sheet and Profit and Loss Account dealt with by this report are in agreement with the books of account;

(e) in our opinion and to the best of our information and according to the explanations given to us such Balance Sheet and Profit and Loss Account subject to note 1 regarding rent and note 3 regarding taxes, to the extent as stated therein, give the information required by the Companies Act, 1956, in the manner so required for Banking Companies and on such basis the said Balance Sheet gives a true and fair view of the state of affairs of the Indian Branch of the Bank as at 31st March, 1989 and the Profit and Loss Account gives a true and fair view of the Profit of the Indian Branch of the Bank for the fifteen month period ended on that date.

On Approaches to Apartheid

M S S Pandian

Race, Class and the Apartheid State by Harold Wolpe; James Currey, London, OAU, Addis Ababa and Unesco Press, Paris, 1988; pp 120.

THIS slender volume on the history of apartheid in South Africa proceeds with two objectives. First, it intends to develop a critique of the existing theoretical positions on the relationship between race and class and the nature of the political system in South Africa. Taking this critique as a point of departure, secondly, the book aims to analyse the post-1948 political formation in South Africa within a historical perspective.

The book is divided into five chapters. The first two chapters provide, through a review of literature, a detailed theoretical critique of the existing South African studies. In the third chapter, the author, informed by the shortcomings of the existing approaches, sets out his own perspective on apartheid. The last two chapters give a concrete analysis of the political formation in South Africa in the post-1948 period.

Theoretical Critique

The book begins with identifying and criticising three theoretical closures, which characterise the existing approaches to the South African political formation. These theoretical closures are: (1) over-emphasis on the historical continuity of apartheid (2) class and race reductionisms, and (3) over-emphasis on the description of political struggles.

The first theoretical closure, i e, the over-emphasis on the historical continuity of apartheid, is found in liberal, racist and black consciousness literature. Marxist literature on South Africa is also not totally free from this. According to Wolpe, this all-pervading approach reduces the whole history of South Africa to a single catch-all category of white domination and in that process fails to recognise and analyse the discontinuities in or the changing phases of South African political formation. In other words, it does not account for "[the] emerging tensions and contradictions within the social system and structural transformation of the 'space' in which conflicts are waged" (p 6).

The second theoretical closure, class and race reductionisms, treats class and national struggles as separate and distinct modes of political intervention. While the race reductionists treat politics as if it has nothing to do with the economy, the class reductionists "allow the political only insofar as it reflects economically determined interests". Criticising this separation of class and national struggles, the author shows that such a separation oversimplifies the political sphere and "makes it impossible to analyse the complex interaction of these struggles in the political arena" (p 15).

The last of the theoretical closures which the book analyses is the tendency to reduce analysis of politics to mere description of struggles. While Wolpe agrees that description of struggles is important, he notes that mere description of struggles delinks them from the wider structural contexts, which give rise to them. Thus this approach cannot even pose such central questions like how different structural contexts promote and constrain different forms of political struggle.

In pursuing his critique further, the author takes up, in chapter 2, the different conceptions of the economy, the state and politics found in South African studies for analysis. Here, Wolpe concentrates on the position of liberal modernisation theory on apartheid, the concept of 'colonialism of a specific type' which the African National Congress (ANC) believes in, and the concept of South African fascism. He also analyses the way in which the category of capitalist state is applied in South African studies.

The liberal modernisation theory argues that racism "originates, and is reproduced, outside the modern industrial or capitalist economy" (p 25) and thus it does not aid capitalism but is in contradiction with it. Granting an evolutionary role to capitalism, it believes that the advancement of capitalism will subvert racism which is based on irrational considerations unlike capitalism. But Wolpe aruges that racism can indeed serve the interests of capitalism in certain contexts by supplying cheap labour, etc, as is the case in South Africa. Further, he notes, the political implication of this approach is quite dangerous. It pleads for limited intervention against racism as it believes that the economy, left to itself, will, in its evolutionary advancement, obliterate racism.

According to the concept of 'colonialism of a specific type', "The colonial structure guarantees the superior position and dominance of the white bloc as a whole and with it the specific interests of the different classes within that bloc. Correspondingly, it reproduces the subordinate position of the black group and the different classes within it. Each class is, thus, riven by racial divisions and the fate of different classes, within each racial group, is tied to the maintenance or destruction of racial domination" (p 31). Thus in this approach, the anti-apartheid struggle is also a struggle against capitalism. Though Wolpe's sympathy lies with this approach, he aruges that the concept of 'colonialism of a specific type' is also flawed on certain counts. According to him, one cannot treat nationalist/anti-apartheid struggle as singularly anti-capitalist since different classes which are involved in the nationalist struggle give different content to the struggle and only one among them is anti-capitalism.

The concept of South African fascism connotes "a closing down of the space available for the organisation of struggle on the political terrain, to that extent it may lead, for example, to a struggle which emphasises the armed rather than other forms of illegal struggle" (p 40). There is substantial truth in this characterisation of South African political formation, especially for the period after the Sharpeville massacre in 1960. However, the believers in the concept of South African fascism, by over-emphasising the lack of legal space for political action, do not analyse the role of parliamentary and other independent centres of politics (like trade unions and educational institutions).

In a different manner, the existing studies on the character of the capitalist state in South Africa distort and oversimplify the terrain of politics. These studies, by treating state as a *unified* instrument serving the interests of the hegemonic class faction, fail to take into account "the contradictory and asymmetrical relations within the matrix of state organisations and institutions and the way in which these condition and are conditioned by struggles in the political terrain" (p 37).

Concrete Analysis

Based on this critique, Wolpe develops his own perspective in chapter three of the book. He argues, "If... it is accepted that classes are concretely formed even in the sphere of production, simultaneously through politics, economics and ideology, the race may well become the content, under specific conditions, of the class struggle" (p 52). He notes that such a position "opens the possibility that opposition to racial domination *may* lead to unite black people across class lines and, yet, specifically defined class interests may at the same time tend to divide them along class lines. Similarly, investment in white domination may tend to unite white people across class lines and yet, at the same time, specifically defined class interests may tend to divide them" (p 52).

From such a stance and by taking into account the changing nature and context of political struggles in South Africa, Wolpe periodises, in chapters four and five, the post-1948 political formation in South Africa into three phases: 1948 to 1960, 1960 to 1973, and 1973 to mid-1980s.

When the National Party came to power in 1948, there already existed "a range of

deeply-rooted extra-parliamentary, mass political [black people's] organisations which were in the process of radicalising themselves and an organised trade union movement". This was so despite white domination being a fact of life then. Moreover, the executive was under the control of the legislature and the judiciary enjoyed a certain degree of autonomy from both the executive and the legislature. This basically meant that certain legal space was available for the black people for political action. However, the National Party was in favour of the white farmers and the white workers. The interests of these two classes could be met by restricting the townward movement of the black labour from the countryside. This would force the black labour into white farms and reduce competition from them in the urban labour market.

Since legal space was available for the black people, any move from the state to benefit the whites at the expense of the blacks would draw protests. Given this context, the state enacted a series of laws between 1948 and 1960 to restrict the space available for the blacks for political action. It enacted Suppression of Communism Act and Public Safety Act. While it banned several black political organisations, it increased the power of the executive over the judiciary. Along with this, the state moved to restrict the influx of black labour into urban areas through labour bureaus and pass laws. The culmination of this process was the ruthless killing of 69 blacks at Sharpeville in March 1960 when they demonstrated against the pass laws.

During the second phase, i e, the period between 1960 and 1973, South Africa witnessed further erosion of the legal space for political action and a particular transformation of the economy which resulted in the restructuring of the political space for anti-apartheid action in the subsequent period. Following the Sharpeville massacre, the state assumed emergency powers and banned the African National Congress and the Pan-Africanist Congress. Under the Terrorism and Sabotage Act, the power of the police was increased enormously and the autonomy of the judiciary was drastically reduced. "The outcome of the state policies was not only the abolition of virtually all legal rights to extra-parliamentary political activity but, in addition, the substantial elimination of the organisations within this sphere by banning them and proscribing and imprisoning their activists" (p 70). ANC became an underground organisation and engaged itself in acts of sabotage, hoping to develop full-fledged armed resistance in future. In this context of forced political stability, the economy boomed. There was large-scale foreign investment in the manufacturing sector and the labour force in that sector increased by 63 per cent between 1960 and 1970. There was, despite state restrictions, large-scale townward migration of blacks during this period. As we shall see soon, these developments helped the anti-apartheid movement to restructure the existing political space to its own advantage.

During the third phase (from 1973 to mid-1980s), the parliamentary control over the executive was weakened still further and the role of military was intensified. With Botha's accession to power in 1978, the military took its place "not merely in the defence ministry and in the armed forces but in the president's council, in the state security council and in other departments of the state including economic planning" (p 80). But this destruction of political space for black protest was accompanied by the re-emergence and strengthening of the extra-parliamentary political terrain in South Africa. How did this happen?

The developments during the period 1960 to 1973 contributed towards this quite substantively. With the growth of manufacturing and capital intensification in that sector, there emerged a semi-skilled and stable black labour force in urban South Africa. Moreover, in an effort to confine the politics of this labour to shop-floor (i e, to cut them away from the national struggle), the South African state granted the registration of black trade unions in 1979. These two factors contributed to the proliferation of black trade unions and 5,00,000 workers belonging to various unions came together in 1985 and formed the Congress of South African Trade Unions (COSATU). COSATU supports the national liberation struggle. It became difficult to contain trade unions as a new terrain of politics because the white capital cannot easily replace a stabilised workforce with a high level of skill.

Again there was opposition against apartheid from a section of the white community itself, especially from the large-scale capital. Their interest is only too evident: "Given the limited availability of export markets, the growth of manufacturing depends heavily on the intensification and extensification of the home market which the labourforce provides. Clearly, the reproduction of cheap black labour and the extension and intensification of home market stands in contradiction to one another" (p 89). This again gave some political space for the black labour to agitate.

It is not only the black labour who retrieved legal space for political action during this period. With the destruction of legal space for political action during 1960 to 1973, several previously non-political black organisations—cultural, religious and sporting institutions—became politicised. This process of politicisation first took place discreetly in differnt organisations. In a significant step in 1983 700 such organisations with a membership of two million came together and formed the United Democratic Front. The expansion of education among the blacks during this period turned schools and universities as centres for the black consciousness movement.

With the re-emergence of the legal terrain of political protest and the division among the whites with a powerful section taking positions against the intensification of apartheid, the state introduced limited reforms to co-opt the black petit bourgeoisie and bourgeoisie. It created the subordinate state structure of bantustans which confined considerable number of blacks to bantustans and gave rise to a black bureaucratic bourgeoisie which ran the administration of these administrative units. The limited representation granted to the blacks through the Community Council Act 1977, Black Local Authorities Act 1982 and the Tricameral parliament of 1984 helped in co-opting the urban black petit bourgeoisie. Though these reforms meant to co-opt a section of the blacks have failed to stem the growing protest against apartheid, these are the reforms which give the Botha regime the image that it is a "regime of reform protected by the coercive apparatus of the state by contrast with previous governments which stressed only their repressive role in maintaining control over the black population" (p 93).

General Validity

The importance of this book lies not only in introducing one critically to the various theoretical approaches to apartheid and in deepening one's understanding of the South African political formation. The approaches which characterise the South African studies and analysed in the book are not confined to South African studies alone; but could be found as being employed extensively in analysing other political formations which have ethnicity or even caste as an important component. Nearer home, the abounding literature on Sri Lanka would vouch for this. In this sense, the theoretical critique which Wolpe develops in the book is of general interest. The concrete analysis of the South African political system which constitutes the latter parts of the book, again, could be a model for studying political formations. Steering clear various forms of reductionism which oversimplify and distort one's understanding of politics, the book takes into account the complexities of political formations. It creatively links politics to the economy and struggles to the wider context of shifting class positions and the asymmeterical relations between the different compartments of the state.

The book has a useful bibliography and a brilliantly designed cover. Unfortunately, the credit for the cover design is given nowhere in the book.

Against the Numbers Game

P G K Panikar

From Population to People by Ashish Bose; BR Publishing Corporation, Delhi, 1988; 2 Vols, pp 574, Rs 320 (set).

THE publication under review is a miscellaneous collection of papers presented at various national and international seminars and conferences, presidential addresses at the annual conferences of IASP, articles published in national dailies, etc, during the last two decades. Produced over such a long period, and addressed to diverse groups, the contents are apt to be a disparate collection. They are spread across 17 chapters and several annexures in two volumes.

The focus of Volume I is avowedly on India's family planning programmes. Chapter 1, 'Demography beyond Decimal Points', begins with the remark that the new generation of Indian demographers have failed "to make their mark on the national scene" thanks to their inability to look beyond decimal points. Hence Bose's exhortation to his fellow demographers: "Look beyond decimal points". In the course of the analysis of the pitfalls in India's family planning porgramme he identifies three villains, viz, foreign influence, central government, and bureaucrats in the concerned ministry (pp 4-5). Of these, the bureaucrats receive special attention. "The present scheme of things assumes that the bureaucrat is the best social reformer and catalyst of social transformation" (p 24). Bose next suggests the need for widening our vision of the population problem by paying attention to issues like rapid urbanisation, internal and international migration, etc. He concludes the piece with the sermon: "We should abandon the number game and move from population to people" (p 24), thus demystifying the title of the publication.

Chapter 2, 'Pitfalls in Our Population Control Programme', consists of six parts. Part I, 'Future Prospects of Family Planning in India', covers more or less the same ground as the previous chapter. The message to fellow-demographers is to apply their minds to the various facets of the problem and "not be carried away by the game of numbers" (p 48). Part II covers mostly the excesses in family planning during the emergency and their after-effects. Part III examines the 'New Policy Directions' as formulated by the Janata government in 1979. Bose observes that "...apart from renaming family planning as family welfare, there was no change in the programme" (p 56). This observation seems to be a bit too harsh. He repeats the rejection of the "game of numbers" and pleads for a fresh approach, the main elements of which include dropping the idea of a centralised family planning programme, speedy reduction of infant mortality rate, concentration of family planning campaign in Bihar, MP, Rajasthan and UP (Bi Ma R U), which together account for 40 per cent of India's population, creation of a new agency to market condoms, revamping of communication strategy, decentralisation of family planning, etc (pp 59-64). Part IV 'From Coercion to Persuasion' is mainly an endorsement of the views of the late Indira Gandhi expressed in the course of a television interview when she said that her "government believes in persuasion and not coercion in tackling the population problem" (p 65). Some of Bose's own observations are interesting. He aruges:

> A switch-over to the small family norm... in an economy marked by unemployment and limited opportunities for women outside the home or the farm will mean more leisure which, if untapped, may give rise to family and other tensions and create serious problems for the society. A small family norm and a stagnant economy cannot go together. (p 68).

Is Bose implying that for a stagnant economy the better option is large family, one wonders. Part V, 'People's Movement' opens with a reference to the New Twenty Point Programme wherein the need for promoting family planning on a voluntary basis as a "people's movement" is emphasised. After taking another dig at the bureaucrats, "who are the last persons to trigger off a people's movement", the author passes on to the attainment of the goal of Health for All by 2000. He warns against continued over-emphasis on curative programmes and dependence on foreign aid and foreign technology. These are obviously a part of the received doctrine. However, there is an element of novelty in the suggestion that "instead of appealing for people's participation in government programmes, there should be people's programme with government participation" (p 73). In Part VI, 'Human Resources Development', the author observes that in the light of the poor performance of the family planning programme, the goal of NRR=1 by the year 2000 is unrealistic (p 83). The malady, it is repeated, is that "far from being a people's movement, India's family planning programme is one hundred per cent a bureaucratic programme, designed, financed, controlled and monitored from New Delhi" (p 84). Bose concludes this section with an agenda for human resources development which includes ICDS, compulsory schooling, vocational education.

Part II of Volume I comprises two chapters. Chapter 3, 'Beyond Family Planning Targets', starts with some adverse comments on our population research institutions. According to Bose, the administrative control by non-professional bureaucracy at the centre fails to attract competent researchers.

> To make matters worse, the foreign funding agencies in the field of health and family planning programme have through their use of money power built up a servile squad of 'yes men'... The researchers from these institutions are intellectuals who put good life before good ideas and are therefore available for malleable research and evaluation (p 95).

Bureaucrats remain the targets of vitriolic attack in this chapter also.

> Nowhere in the world have bureaucrats been social reformers... The feeble attempts to put up unimaginative postures urging people to get their sons and daughters married late only indicate the failure of the bureaucrats to communicate with the masses in a meaningful way (p 98).

After repeating the cliche that reproductive behaviour is conditioned by numerous factors Bose arrives at the obvious conclusion that "a family planning programme centred round targetism will not succeed in curbing birth rate" (p 101). He then proceeds to explain why the "present target-setting strategy" is bound to fail. Bose dwells at length on the theme that it is meaningless to set targets for oral pills, for condoms, for IUDs, etc. He once again repeats the by now worn out aphorism: "The family planning programme cannot succeed in isolation. It will fail if other development programmes fail" (p 109). That 'development is the best contraceptive', first aired by Karan Singh at the Bucharest Conferences (1974), has been widely noted. Next Bose presents a slightly modified version of the Gopalan Plan, Grameen Bala Progati Yojana, as a new approach and strategy of family planning. Most of the ingredients of the programmes such as health and nutrition, education, employment, etc, are part of a widely accepted recipe. For example, in his comprehensive study, *India's Population: Aspects of Quality and Control*, Asok Mitra has covered these aspects in great depth [Asok Mitra, 1978]. He concludes the chapter with repetition of a few platitudes: "There are no short-cuts to population stabilisation. There is no substitute to sustained good work. No democracy can take the people for granted. If the people are with you every target can be fulfilled" (p 125).

Chapter 4, 'For Whom the Target Tolls' starts with the assertion: "India's family planning programme is a one hundred per cent bureaucratic programme, a vertical programme designed, financed, controlled and monitored from New Delhi" (p 135). There are other instances of repetition like, for example, obsession with target-setting, pressure exerted on poor peasants seeking loans, recourse to the number game, to mention a few. An 'innovation' which Bose has introduced is "project 1234", according to which "a sound family planning strategy should... concentrate on the age group [illegible] to 34 years". The rationale underlying th[e]

novel proposal is that "our villagers are used to such numbers... is much easier to remember and pronounce than English abbreviations (widely used in rural areas) like ICDS, LHW, ANM or VHG" (p 149). The ingredients of the project are the same as emphasised on earlier occasions like nutrition, health education, employment and income generation, etc, with one difference that in the present case the beneficiaries are those in the target age group. The seminar on Population Policy with Special Reference to Infant Mortality and Fertility in India organised by the Population Research Centre, Baroda (1978) had gone into the various aspects of the family planning programme and come out with a balanced set of recommendation [Gandotra and Narayana Das, (1984)].

Part III of Volume I, 'International Perspective', contains two chapters. Chapter 5, 'Exploring China's Population Policy', covers various aspects of China's population policy: its objectives, targets, norms (perferably one child), steps (late marriages, late births, fewer births, healthier births), methods (incentives and disincentives) and degree of success. In conclusion Bose observes that the advocacy of one-child family reflects a pragmatic approach. However, he has expressed concern over the outcome in the long run, if the one-child norm is strictly adhered to:

> Thus, the Chinese might succeed in solving one type of population problem symbolised by high birth rate and in that process land with another type of population problem symbolised by a high proportion of aging population (p 192).

Chapter 6, 'Democracy and Demography' is directed to the question: Are democratic institutions unable to cope with demographic processes in Asia? Admittedly, there is clear evidence of demographic pressure in the Asian countries. However, Bose argues that none of the successful models of fertility control tried out in Asia so far—Japan, Hong Kong, Sri Lanka and China—seems to be applicable in south Asian countries like India, Pakistan and Bangladesh (p 212). The conclusion is that despite compelling demographic pressures, democratic institutions are still the best option for Asian countries.

Volume II contains 11 chapters and several appendices. It is also divided into three parts. Part I, 'Demographic Data Base', comprising two chapters, covers the highlights of the Indian censuses before and after independence. Chapter 7, 'Census in British India: An Imperial Tool?' (the first in the volume) attempts to give a historical perspective of the census in British India. Considerable space is taken up in the recitation of wild rumours about the objectives of the census count and the constraints experienced by the census enumerators in the rural areas during the earlier censuses. Why there had been so much emphasis on caste, tribe, religion and language in the censuses during the British rule is the next question which receives a good deal of attention.

Chapter 8, 'Census in Post-Independent India: An Ineffective Tool?' begins with the question of why demographic data are not effectively utilised in our planning exercises. The main source of data is the census; but the author contends that "the Census Organisation suffers from a high degree of obsolescence. It continues to be headed by a non-professional IAS officer" (p 308). The other sources of demographic data, viz, the Sample Registration System (SRS), Civil Registration System (CRS), National Sample Surveys (NSS) and Family Planning Performance Statistics, fail to make available data at the district level. Turning to the issue of the quality of data, Bose puts the blame for the poor quality of the census and SRS data on the paltry honorarium paid to the persons collecting the data. As to the CRS, it is observed that the data collected on births and deaths are grossly underestimated. The quality of the NSS data is also apparently dubious. FPPS seems to suffer in quality thanks to a built-in over-reporting bias inherent in the policy of the government of India consisting of cash incentives (p 315). The discussion is followed by a series of recommendations aimed at strengthening the demographic data base, covering census, SRS, CRS, and Family Welfare Statistics (pp 317-320) and five appendices (pp 321-336).

Part II of this volume, 'Politics of Population' includes four chapters. The first in this section, Chapter 9, 'Foreign Aided Health and Family Planning Projects', is a case study of area projects. The picture emerging from the field work in the BiMaRU states is that

> the money under these projects was mostly spent on bricks and mortar and the real beneficiaries were the building contractors and sub-contractors and not the people. The weak conceptualisation of the projects coupled with poor implementation led to their failure.

This is followed by a number of generalisations on the lessons from India's experience, like, for instance: in a large country like India, there cannot be one blanket model plan; the selection of areas for implementation of projects should not be guided by political considerations but by scientific criteria; highest importance must be given to the development of leadership at the grassroots level.

Chapter 10, 'Centre-State Relations: Areas of Conflict?' is a reproduction of the evidence given by the author before the Sarkaria Commission in January 1985. His main suggestion before the commission is that family planning should be on the concurrent list, with greater devolution of power and funds to the states and lower tiers of administration. Chapter 11 'Are Religious Minorities Growing Fast?' analyses the reasons behind the higher growth rate of Muslim population in India, chief among them identified being illegal immigration from outside. Chapter 12, 'Re-tribalisation of Scheduled Castes?', looks at the puzzle of a much higher growth rate of tribal population, 42 per cent during 1971-81 as against 25 per cent for the total population of India. Part of the explanation, it is brought out, lies in the differences in classification of the successive censuses. The tendency of non-tribals to return themselves as tribals in order to take advantage of special provisions for the tribal population is identified as another factor (p 318).

In Part III, 'Health Care for the Vulnerable', there are five chapters (and a few appendices). Of these the first, 'Allocation of Resources for Health Care' goes over the reports of various expert committees on health, right from the Bhore Committee to the report of the ICSSR-ICMR joint committee. After reciting the observations of some researchers on the allocation of resources for health care, Bose attempts to take "a historical perspective" of the dominant health issues confronting India. Next the author reproduces the objectives and priorities of the health policies in the First and Second Five-Year Plans. Under the caption of "allocation between health and family planning", the author repeats platitudes such as: "there are no short-cuts to population stabilisation", "there is no substitute to sustained good work", "no democracy can

take the people for granted", etc (p 401). In the concluding section of this chapter Bose dilates on the inadequacy of the budget of the PHCs, disillusionment and frustration of the young doctors posted in remote rural areas, the ill-fated CHV/VHG scheme, etc. "It is a sad story of a raw deal given to our rural masses by the elitist medical bureaucracy" (p 409). Chapter 14, 'Orissa's Low Growth of Population: Tribal Development or Tribal Stagnation?', is perhaps the most interesting paper in this collection. Bose attempts to explain the puzzle of the low growth rate of Orissa's population during 1971-1981, viz, 19.7 per cent, the third lowest among all the states. Possible explanations of a low growth rate in population such as under-enumeration, high mortality, fall in fertility, outmigration, fall in fecundity, under-nutrition, etc, are eliminated. Then Bose posits the hypothesis that the fall in the population growth rate in Orissa is due to the high rate of acceptance of family planning by the tribal population: "the story of family planning success is centred round the tribal population" in Orissa which has the second largest tribal population in India.

> There is a lurking suspicion that the innocence, poverty and credulity of the tribals has been exploited by the family planning dalals (brokers) who must have excelled in the game of fulfilling targets (p 437).

In Chapter 15, 'Welfare Programme for Women and Children', Bose takes a critical look at the MCH, ICDS and family planning. One major deficiency of these programme, it is noted, is the weakness in their monitoring and evaluation. Since the evaluation reports of ICDS are in effect glorification of spurious statistics ICDS, according to Bose, stands for 'Indiscriminate Collection of Dubious Statistics'. On the impact of the programmes, the author is not able to come to any firm conclusion, thanks to several limitations in the methodology used in the evaluation reports. Apparently the impact is negligible. Who is to blame?

> ...more often than not, the local functionaries are not working effectively because of lack of training, supervision and management. Therefore the fault lies not at the grassroots level but in the air conditioned offices in New Delhi! (p 453).

He concludes with the proposal of a five-point strategy which includes a stress on quality of the delivery service at the grassroots level, actual involvement of the people in formulating and implementing those programmes, discontinuance of cash awards to the states for family planning work and of the incentive scheme for the acceptance of family planning. And, last but not least, "the number game must stop" (p 456).

The last two chapters in Volume II are concerned with the problems of ageing population. Chapter 16, 'Concern for the Ageing Population' purports to present a profile of the aged and to highlight some critical issues. Our retired persons are presumed to be better off than their counterparts in the western countries thanks to the continuance of the joint family system here (p 494). However, "the plight of the aged in rural areas, especially the position of landless workers, who have nothing to fall back upon after retirement" is deplorable (p 501). Bose, therefore, proceeds to bring out the more acute problems associated with ageing for this hapless group.

> The poor nutrition and low income levels to which they are subjected right from the beginning of their life lead to premature ageing. In a country like India, the focus should be on premature ageing rather than active ageing.

Bose in this connection makes the observation that India has much to learn from the experience of developed countries about the care and treatment of the aged; but the latter can likewise learn several things from India. The concluding part of the essay spells out a plan of action which includes counteracting premature ageing, institutional care for the aged, extension of Employees' State Insurance Scheme to agricultural workers, mobilising retired teachers to banish illiteracy, etc. In Chapter 17, 'Agenda for Active Ageing' one of the novel ideas thrown up by Bose is the establishment of UNICEF II (United Nations Care for Elderly Fund). Another innovative proposal is inter-city co-operation, a programme under which

> voluntary agencies should bring a few hundred elderly persons, preferably in the age group 65 to 75, from the developed countries and settle them temporarily in selected cities of India. If the elderly from the developed countries spend their pension money in Indian cities during their stay in India, such a scheme would be economically viable... (p 529).

In brief, the book is replete with too much of rhetoric, adverse if not uncharitable remarks on bureaucrats, but it fails to provide any fresh insights on either population or people. However, the large number of tables and other annexures would be useful as a ready reference for researchers in this area.

On Participating in the International Capital Market

V V Bhatt

The rationale for participation in the international credit and capital market as well as the domestic institutional and policy framework, essential for the purpose, are presented in this paper with particular reference to India. However, this is just for the sake of illustration; what is said about India applies to other developing countries of her type as well. For active participation, it is essential for her to adapt her macro-economic policy framework and institutional capacity to the evolving nature and characteristics of the international market. The nature and characteristics of the evolving international capital market are tersely presented in Section I. The immediacy as well as the urgency for participation in this market is the theme of Section II, while Section III deals with the prerequisites for such participation in the sphere of institutional and policy framework. Section IV stresses the need for liberalisation of the domestic financial markets. Some concluding observations are made in the final section.

SINCE 1970, international credit and capital market has grown in size and sophistication and provides considerable opportunities for the developing countries to operate in this market for the purpose of meeting their growing requirements for external resources and as well as for the optimum management of their external assets and liabilities. Further, it enlarges the scope of export possibilities in the field of financial services particularly for the Asian countries like India. Thus, it is essential for the developing countries to participate actively in this market. However, for such participation to be possible, they need to evolve an institutional and policy framework that is appropriate for establishing their creditworthiness, organically linking their domestic market with the international market, integrating their domestic financial markets and developing the necessary institutionalised expertise and technology. Moreover, to take advantage of export possibilities with regard to financial services as well as other types of service products, they need to be active participants in the process of multilateral negotiations relating to trade in services in the Uruguay Round of trade negotiations; only thus will they be able to evolve a services compact that suits their needs and capacities.

The rationale for participation as well as the domestic institutional and policy framework, essential for the purpose, are presented in this paper with particular reference to India. However, this is just for the sake of illustration; what is said about India applies to other developing countries of her type as well.

India is one of the few countries in the group of less developed countries (LDCs) that has the potential for developing the needed institutionalised expertise and technology for active participation in the international market; further, there is a certain immediacy as well as urgency for her to do so in order to reduce the foreign exchange cost of operating in this market as well as to enlarge the scope of her export effort. For such active participation, it is essential for her to adapt her macro-economic policy framework and institutional capacity to the evolving nature and characteristics of the international market.

Such is the broad theme of this paper. The nature and characteristics of the evolving international capital market are tersely presented in Section I. The immediacy as well as the urgency for participation in this market is the theme of Section II, while Section III deals with the prerequisites for such participation in the sphere of institutional and policy framework. Section IV stresses the need for liberalisation of the domestic financial markets. Some concluding observations are made in the final section.

I

Nature and Characteristics

The international capital market that has been evolving since the late fifties and early sixties after a state of suspended animation during the inter-war years is characterised by the interrelated interlinked phenomena of internationalisation, globalisation, integration and innovations.[1]

Internationalisation: This market is international in the sense that it is not subject to the regulation and control of any national authority. The Euro-market is in this respect similar to the informal credit markets in several developing countries—the markets that are out of reach of the national regulating agencies. The former is relevant for large participants—large corporations, public entities and sovereign governments—while the latter for small enterprises of all types; however, both these markets are characterised by relatively low transaction costs for borrowers partly because of their freedom from regulation.

Globalisation: The globalisation aspect refers to the *interlinkage that is established among national markets* as a result of progressive removal of exchange controls on capital flows, liberalisation of the various financial centres in the developed countries and the revolution in information gathering, processing and transmission made possible because of technological developments in the fields of computer and telecommunications (both described pithily as computronics). This phenomenon has widened and deepened the scope of the international market as financial institutions are now able to offer 24-hours sales and trading capability in debt and equity instruments; it is possible now to make global offerings of debt and equity, which *widens* the scope of the market, and the market now provides opportunities for swap deals relating to currency and/or interest rate—the opportunities that *deepens* the scope of the market.

This interlinkage of national markets has evolved particularly after the mid-seventies into an international market in financial instruments, denominated in several key currencies. International transactions were predominantly in sterling during 1870-1914 and in the US dollars in the sixties and early seventies; the international market since then is a multi-key currency market and it is this phenomenon which has made it possible to evolve the currency swap markets after 1982— an evolution which was pioneered by the World Bank in 1983.[2]

The interlinking of national markets—the phenomenon of globalisation—has led to the convergence of interest rates in different national markets. In Euro-markets, covered interest rate parity holds almost instantaneously. More significantly, interest rate changes—nominal and real—originating in one major financial centre are being quickly transmitted to the other financial centres, despite the floating of the major key currencies. There has been thus a growing interdependence among major financial centres and this has reduced the scope for national monetary policies that are out of line

with those in the other centres. Further, capital flows have become a dominant causal factor at least in the short run in the determination of interest rates and exchange rates; and this can lead to misallocation of resources among various productive sectors as a result of such price signals that may not be consistent with comparative cost patterns. To minimise the adverse effects of speculative capital flows, it has now become essential to have international co-ordination of macro-economic policies in major countries, particularly relating to interest rate and exchange rate policies, through an international institution like the International Monetary Fund.

Integration: The integration of money, banking and securities markets as a result of progressive deregulation—that is, removal of legal restrictions on interest rates and the functional scope of various financial institutions particularly since 1979—has integrated the national financial markets, created a competitive environment, and given rise to the phenomenon known as securitisation. The large borrowers—and in particular the multinational corporations—find it profitable now to borrow directly from the securities market at a cost lower than the cost of borrowing directly from the international banks. This development has blurred the distinction between investment banks and the commercial banks and both are evolving into universal banks, which provide all types of financial services, a sort of a department store type of banking.[3] This development has widened the market for financial services because of the integration of bank and non-bank financial intermediaries; the borrowers tap now not only the resources of the banks but also the resources of the other financial intermediaries. Even the international banks are now raising resources from the securities market through securitisation of their assets as well as by issuing their own securities. The market is also deepened because of the securitisation of assets, which otherwise would have been dormant—for example, the assets in the form of houses or loans.

To take advantage of the globalisation and integration phenomena, there has been a progressive implantation of banks worldwide—an institutional internationalisation of banks.[4] Banks have continued rapidly to increase their branches and representative offices abroad. Furthermore, foreign banks have continued to expand their share of total bank business. There has also been a growing importance to banks of international business.

These developments in the international capital market have increased competition among financial institutions. As a result, the cost of borrowing, for example, for large corporations has declined and the net yield (net of risk and transaction costs) to primary lenders or investors has increased, while the fees and margins of banks have diminished.

Innovations: The widening and deepening of the market and the growing intensity of competition among financial institutions have induced several financial innovations or technical change. As Adam Smith[5] observed long time ago, the size of the market and technical change (or division of labour) are interrelated phenomena; the greater the size of the market, the greater the scope for technical change; the greater the technical change, the greater is the size of the market. And so it has happened in the international financial markets. These innovations[6] or new financial instruments have widened the choice with regard to instruments for both savers/investors and borrowers; investors now can choose instruments with characteristics (relating to yield, liquidity, risk and transaction costs) that they prefer and similarly borrowers too have a wider choice with regard to instruments with different cost-risk combinations.

The basic rationale for these innovations relates to the reduction of subjective risk by wide diffusion and sharing of risk. The *perception* of risk is different for different market participants because of asymmetry of information, different capacity to absorb and process information and the differing attitudes towards risk;[7] these innovations tend to shift risk to willing risk takers—willing partly because their perception of risk or subjective risk is lower than those who want to shift the risk. This process of diffusing, sharing and shifting of risk—largely as a result of the phenomenon of securitisation—has its dangers; it creates uncertainty with regard to the location, extent and pricing of risk and as a result a sort of inertia or lethargy in properly appraising the risk involved in the light of potentially available information.[8] This may lead to instability and vulnerability of the international financial system as a whole because of the inter-locking assets and liabilities of various financial institutions. Further, expectations tend to be based on what Keynes calls, "average opinion thinks about average opinion" or what Pigou calls, "errors of optimism and pessimism", resulting in inherent instability of credit as Keynes christened it.[9] Adequate prudential regulation of the national as well as the international financial system with lender of last resort provision is, thus, essential for the stability of the system as a whole. This is the rationale for an institution like the international central bank.[10] The requirement for prudential regulation is already recognised by the national authorities and an international agreement with regard to capital adequacy requirement for financial institutions is a pointer to what needs to be done at an international level. After this necessary digression to pinpoint the vulnerability of the unregulated international market, let us now revert to the nature of financial innovations that have been introduced in the international financial markets.

In the seventies, the OPEC countries preferred to keep their surpluses arising from the oil price stock—quadrupling of oil prices in 1973, which quintupled in 1979—as Eurodollar deposits with international banks. At the same time, there was instability in the interest rates in the various financial centres. These two events gave rise to the *innovation of syndicated bank loans* at variable interest rates. These loans were primarily made to the oil-importing developing countries and the lack of proper risk appraisal by the international banks as well as the borrowing developing countries ultimately led to the debt crisis of 1982 and after—a crisis which still remains to be resolved.

The other important innovations were introduced after 1982. By that time, the payment imbalances were arising largely among the developed industrial countries. The surplus countries like Japan and West Germany preferred to invest in securities, and in the borrowing countries—mainly the US—the borrowers preferred to borrow by issuing securities of various maturities. This conjuncture led to the securitisation process and the major innovations tried to deal with the risks arising from the volatility of interest rates and exchange rates, resulting from the breakdown after 1973 of the Brettonwoods system of fixed exchange rates, and the structural payment imbalances among the developed countries; these are also the innovations which are relevant for the developing countries that are creditworthy.

The first such innovation is Note Issuance Facility (NIF) or its variants like Revolving Underwriting Facility (RUF) or Euro-Commercial Paper (ECP). A RUF is a facility in which a borrower issues, on a reviving basis, bearer notes which are sold to investors, who may or may not include banks, either by a placing agent or under a tender mechanism. This issuance of notes may or may not be underwritten for a medium-term period by a group of underwriting banks. ECP was developed by adopting the technique customary in the US commercial paper market, whereby short-term paper of variable maturities is issued to one or more dealers on an uncommitted basis, whose task it is to place it with the banks and other investors.

The main advantage is one of cost. The borrower essentially benefits from short-term interest rates and a smaller margin on the rate because the investor is only taking on a short-term risk. A small underwriting fee to the underwriter, who will have only a contingent risk, converts it into a medium-term facility. The particular advantage to creditworthy LDCs, like some of the Asian countries, is that as the borrower's credit standing improves, the margin on its paper decreases, whereas with a syndicated loan the borrower would be fixed into a margin for the life of the loan. The other advantage to a developing country is that, as the investors are a separate group, it can diversify the funding source away from those banks who have traditionally been lenders to the country—which is obviously very important

if the country has substantial financial needs. Lastly, as notes under a RUF are issued regularly and partly to non-bank investors, a borrower's name would become established in a market which is effectively a bridge between the banking and capital markets, making it possible ultimately to tap the capital market by way of Floating Rate Notes and Euro-bonds.

Though so far NIFs have been arranged overwhelmingly for developed countries, a number of developing countries, notably South Korea, Singapore, India and Indonesia, have begun to arrange NIFs, mostly for small amounts. First RUF for an Indian borrower was undertaken by the London branch of the State Bank of India at the end of 1984 which was then refinanced in 1986 partially by way of a Euro-Commercial paper programme—again a first for an Indian borrower. This experience enhanced India's creditworthiness; though the first paper was traded at the margin of a few basis points above LIBOR, it was then placed with investors at rates below LIBOR.[11] The first issuance of Euro-Commercial Paper (ECP) from India has been by the Industrial Credit and Investment Corporation of India (ICICI) in 1987. The Bank of Baroda is currently contemplating (1988) a NUF in the US for the purpose of lending in the UK market.

While the advantages of the securitised market obviously apply to developing countries, who generate enough bank and investor interest, it also has, in a different form through some methods, a limited application to other countries. These methods may be called *credit enhancement schemes.*[12] In essence, the security—a bond or a note—issued by a borrower would have to be structured in a way to make the risk acceptable to international investors. One way to enhance creditworthiness would be through collateralising the debt instrument. Such credit support may take the form of direct collateralisation by the assignment of certain foreign currency revenues to back principal and interest payments on a bond. Commodity indexed bonds or bonds linked with export performance or performance of specific projects are also instances of such schemes. Credit enhancement can take other forms such as the comfort to investors of having the World Bank in a co-financing role or a guarantee from a multilateral agency.

Credit enhancement can be used not only to allow countries of lesser creditworthiness to tap private capital sources but can also be used by other developing countries, including India, to meet other objectives. Collateral, partial or whole, can for example be used to lengthen the maturity of a borrowing beyond the normal term of a market financing. Alternatively, if the collateral were in a foreign currency or linked to a foreign currency, it could be a useful hedge against the risk of a devaluation of the domestic currency. These methods of credit enhancement can, of course, be used on non-securitised financings equally well.

Such innovations, however, can be introduced only if the developing countries become active participants in the international market. The innovations so far introduced have not been motivated by the special needs of the developing countries. The reasons are: developing countries have not been significant participants in the market and secondly most financial institutions are inherently conservative and therefore tend to introduce innovations mainly in their dealings with the most creditworthy borrowers—which developing countries have not been for some time.

The most interesting innovation as a result of globalisation relevant to the developing countries is the development of the swap market in both currency and interest rate swaps. A swap, as the market understands the term currently, is a medium- or long-term arrangement between two parties in which each party commits to service the debt obligation of the other. This has been the most radical or revolutionary innovation that has been introduced in the international market in recent years.[13] As a result, borrowers are no larger restricted only to those markets in which their name is acceptable or where their credit standing is the highest but which do not provide the currency and type of debt they require. A borrower can tap the market for borrowing, where he is most creditworthy and hence can get the most favourable terms and then trade or exchange this debt obligation with the most creditworthy borrower in another market, where his own credit standing is low but which is still preferred by him for business reasons. This in fact is the application of the comparative cost principle to capital transactions. For example, a developing country, traditionally excluded from the fixed rate dollar bond market, can raise a syndicated floating rate dollar- or sterling-loan and swap it into fixed rate dollars. Such swap techniques are not linked to new transactions only. Indeed, to a considerable extent, the swap market does not distinguish between primary and secondary swap transactions and swaps can be arranged in such a way as to match identically the payment date of existing borrowing, that is, for the purpose of the management of existing debt with a view to reducing the risk arising from exchange rate and interest rate changes.

The Industrial Development Bank of India (IDBI) and the Export Import Bank of India (EXIM BANK), for example, have taken advantage of this swap market; so far, the IDBI has entered into four currency-cum-interest swap transactions and the EXIM BANK has entered into two such deals. (These two along with the ICICI and the State Bank of India (SBI) have resorted to external borrowing from the international market as have some public sector firms like Air India, which also took advantage of one swap transaction to reduce its debt obligation). Some other Asian countries like South Korea have also tapped this market.

Unfortunately, swaps are generally confined to the more creditworthy developing countries like some Asian countries particularly as swap counterparties tend to be large corporations as well as banks who are not in a position to take on third world risk. Certainly, the role of multilateral institutions who may stand up as swap counterparties would be useful and institutions like the Work Bank and Asian Development Bank could assume this role. It is the World Bank which pioneered swap transactions in 1983 and it has considerable experience of dealing in the international market as well as taking advantage of financial innovations;[14] it is hence in a position to offer advisory services to the developing countries and suggest methods and techniques of credit enhancement for participating in the international market.

Size of the Market and Share of Developing Countries: The size of the market has grown very significantly since 1970 in terms of several indicators. For example, the current account surplus of the payment surplus countries has increased from about $ 13 billion in 1970 to about $ 200 billion in 1986 (Tables 1 and 2). The net resource outflow as a proportion of GDP has increased during 1965 to 1986 in several developed countries; for Federal Republic of Germany,

it has risen from 1 per cent to 5 per cent and for Japan, from 1 per cent to 4 per cent (Table 3). The net new resources raised through all facilities in the international market have increased from 5.7 per cent of world exports in 1976 to 9.3 per cent in 1984 or from about $52 billion in 1976 to $ 315 billion in 1987.

However, the share of the developing countries in this net resource inflow has declined in the eighties and is currently negative. (Table 3). The net payments surplus of the developed countries was about $ 7.5 billion in 1970; but by 1986, this was converted into a deficit of about $ 22.7 billion (Table 2). In fact, by 1986, the developed countries and in particular the US had a net inflow of resources from the developing countries; the surpluses of Japan and Germany were more than offset by the deficit of the US. The developing countries, thus, have become paradoxically net exporters of capital to the developed countries—the result of the debt crisis which emerged since 1982. The participation of the developing countries as a group in the international capital market is negligible except for a few Asian countries like South Korea and India. The total debt obligations of the developing countries in the international market are much less than 10 per cent of the total.[15]

The growth in the size of the market since 1970 has been largely because of the payment imbalances that emerged since then. The OPEC surpluses that emerged after the oil price shocks of 1973 and 1979 were largely kept as deposits with the international banks, who recycled them largely to oil importing developing countries; the latter's external debt as a proportion of GNP rose from about 13 per cent in 1970 to about 35 per cent in 1986. For the highly indebted developing countries, mainly in Latin America, the external debt as a proportion of GNP rose from about 10 per cent in 1970 to about 46 per cent in 1986; for the Sub-Saharan countries, it rose from about 13 per cent in 1970 to about 57 per cent in 1986. Thus all these developing countries lost their creditworthiness by 1982 (Table 5).

The payment imbalances that emerged after 1980 were largely confined to the developed countries; the largest surpluses in 1986 were in Japan and in the Federal Republic of Germany. The other major surplus countries were Taiwan, China and South Korea. Most of these surpluses were absorbed by the developed countries like the US and what was left for the developing countries out of a total current account surplus of all surplus countries of about $ 200 billion was a negligible amount of about $ 11 billion in 1986 (Tables 1 and 2), which was more than offset by their debt service obligations, resulting into a negative resource inflow for the developing countries as a group.

The size of the market may shrink if the current payment imbalances are corrected by national as well as international policy measures. However, there would be adequate scope for creditworthy developing countries, like the Asian countries, to operate in this market and take advantage of the new financial innovations. The rationale for their participation in this market and the preconditions or prerequisites for such participation are discussed in the subsequent two sections of this paper.

II

Rationale for Participation

The developing countries like India would have to rely increasingly on the international market for several reasons:
—to obtain external resources essential for accelerating their pace of development;
—to manage external debt with a view to reducing debt service obligations;
—to manage international reserves; and
—to take advantage of import substitution and export possibilities relating to financial services.

External Resources: The average annual growth rate of GDP for developing countries as a group has declined from 6.1 per cent during 1965-80 to 3.8 per cent during 1980-86 partly as a result of a negative resource inflow from abroad (Table 6). They need net external resources at least equal to 3 per cent of their GDP to regain the pre-1973 momentum of development. The opportunities for concesssional borrowing from multilateral and official agencies are quite limited because of the fiscal, payments and growth problems facing the developed countries. Thus the developing countries have to take recourse to borrowing from the international market.

For India, the average annual growth rate has increased to about 5 per cent during 1980-86 from 3.7 per cent during 1965-80 (Table 6). However, this growth rate is inadequate for raising appreciably living standards, removal of poverty and securing reasonable levels of employment.

However, even for maintaining the growth rate at 5 per cent per year, India requires external assistance of 2.5 to 3 per cent of her GDP. It has been estimated by the World Bank that external resource requirement would be about 2.78 per cent of GDP during 1988-89 and 2.40 per cent during 1990-91 on the assumption that exports would increase at an annual rate of at least 6 per cent. The debt service obligations are estimated to be about 1.76 per cent of GDP during 1988-89 and about 1.40 per cent during 1990-91; thus the requirement of net resource inflow (net of debt service obligations) would be about 1 per cent of GDP during 1988-91.

The opportunity of obtaining concessional assistance have been diminishing in importance since 1975; her non-concessional debt as a result has been rising from about 6.5 per cent of total external debt to about 27 per cent currently and is estimated to be about 50 per cent by 1990 (Tables 7 and 8).

External Debt Management: The external

public debt of all developing countries has increased from about 13 per cent of GNP in 1970 to more than 35 per cent in 1986 and debt service as a percentage of exports of goods and services has risen from about 10 per cent in 1970 to about 20 per cent in 1986. For India, total external debt as a percentage of GNP has been more or less stable during 1970-86, though private debt as a percentage of GNP has risen from about 0.2 per cent in 1970 to about 1.1 per cent in 1986; the debt service as a percentage of exports of goods and services, too, has been more or less stable in the range of 24-27 per cent during this period (Table 5).

The debt service obligations change as a result of the volatility of interest rates and exchange rates. However, the risk arising from such changes can be reduced by effective and efficient management of debt. Such opportunity has been created in the international market since 1982 as a result of the innovation of currency-interest rate swaps. It is not possible to avail of this opportunity without actively participating in the international financial markets.

For highly indebted countries, the debt/GNP ratio is very high (about 45 per cent in 1986) and the debt service ratio too is quite high (about 30 per cent in 1986). For Sub-Saharan countries, the debt/GNP ratio is even higher at 57-58 per cent in 1986 and the debt service ratio is about 20 per cent (Table 5). For these countries, the reduction of both these ratios is essential for attaining reasonable rates of growth. For the Sub-Saharan countries, debt relief in various forms is already being considered; it is possible to do so as most of their debt is to official agencies.

However, most of the debt of the highly indebted countries particularly in Latin America is owed to the private sector; for these countries, some radical solution to this problem is imperative. This debt is being securitised and sold at a discount in the international market; but the advantage of this discount is not available to the debtors. It may be possible to devise some mechanism to pass on the discount to the debtors. The International Monetary Fund (IMF), for example, can buy this debt at a discount in the market and pass on this discount to the debtors. In such a case, the discounted debt obligation of the debtors would be to the IMF. The latter can create a type of trust fund to finance the purchase of debt and can recover this debt from the indebted countries over a period of time. The advantage of the IMF as an intermediary is that it is in a position to negotiate with the debtor countries and monitor the changes in the macro-economic and institutional policy framework—the changes which are essential for promoting growth and development and establishing creditworthiness in the international market.[16] The evolving international market could create suitable financial instruments for these types of transactions. However, for this to be possible, the developing countries should have the capacity of exploring the possibility of and introducing such innovative financial instruments as may be necessary.

Management of Foreign Exchange Reserves: The developing countries as a group have gross foreign exchange reserves equal to about 3.5 months of import coverage (or about $ 160 billion in 1986); for India, these reserves constitute about 4 months import coverage (or about $ 10 billion in 1986). The international market provides opportunities of investing these reserves and changing the composition of such investment so as to obtain a satisfactory yield on such investment and reduce the risk arising from interest rate and exchange rate changes.

Import Substitution and Export Possibilities: For some countries like South Korea and India, which have a sound well developed financial system and adequate technical and professional manpower, there is a potential that can be developed, through institutionalised expertise and financial technology, for acquiring the capacity to provide financial services to domestic borrowers, intending to have operations in the international market, as well as to export such services to other developing countries. These services are generally skill- intensive and much less capital-intensive than some of the manufactured products. Developing the capacity for providing such services on the basis of their dynamic comparative advantage would strengthen their payment position by saving on foreign exchange cost relating to their transactions in the international market (import substitution advantage) as well as by earnings from the export of such services. This potential somehow has not been exploited; the necessary institutional and policy changes, hence, have not been identified and implemented. For their effective and efficient participation in the international market, it is essential to seize all opportunities for the actualisation of this potential.

III

Pre-Requisites for Participation: Agenda for Research

Participation in the international capital market is possible only if certain pre-conditions or pre-requisites are satisfied through an appropriate institutional and policy framework. This framework has to be such as to:

— establish and maintain creditworthiness;
—bring about progressive integration of the domestic and international markets; and
— promote competitive impulses and pressures for improving the effectiveness and efficiency of domestic financial markets in an environment of financial stability ensured through strategic and prudential regulation of the financial system.

These are inter-related and inter-linked policy measures and it is not possible to take action on one front without at the same time relating it to the other two. How to evolve such an institutional and policy framework requires detailed study and research in the context of a given country like India. At this stage, what is attempted in this and the next

section is merely a tentative broad outline of such a framework.

Establishing and Maintaining Creditworthiness: Creditworthiness, as the market understands it, depends generally on certain characteristics of the growth process. One is that external debt should be growing at a rate of lower than the growth rate of national income and the other is that exports should grow at a rate higher than the rate of increase of debt servicing obligations. Thus, the higher the growth rate of income and exports, the greater would be the opportunity of external borrowing; and the larger the external borrowing—if productively and efficiently invested—the higher would be the growth rate of income and exports.

Productivity or efficiency of investment is thus the most critical factor. The institutional and policy framework, however, should be such as to create a favourable environment for entrepreneurial functioning and competitive pressures and incentives for improving investment and productive efficiency. The price system for this purpose has to be as little distorted as possible; otherwise the decision signals would turn out to be misleading. Further, administrative controls or regulations or interventions, when essential for the purpose of accelerating the pace of development, should be minimum, of strategic significance, selective, purposive and time bound and should be, what Bhagwati calls 'prescriptive' rather than 'proscriptive'.[17] The "Far Eastern governments, by and large, issue prescriptions rather than proscriptions... whereas countries such as India do the opposite. The governments of 'dos' generally produce economic performance superior to that produced by government of 'don'ts'.[18] The former foster and promote entrepreneurial impulses, while the latter stifle them; the former establish symbiotic partnership relationship with the private entrepreneurs, while the latter induce adversarial response and unproductive wasteful expenditure to overcome or to take advantage of restrictive measures without a positive rationale.

To be creditworthy is not enough. A country has to establish its creditworthiness in the market by its continuous presence in order to seize opportunities as they arise of borrowing as well as management of external assets and liabilities. It may be advantageous to borrow, even when external resources are not required, when one's payments position is strong and growth experience good; one may obtain most favourable terms in such a situation and the additional resources so obtained can be used for pre-payment of debt incurred earlier on less favourable terms. Further, in such a situation, it may become possible to introduce credit enhancing innovative financial instruments, that tailor debt service obligations to one's ability to repay. Such transactions or operations need to be undertaken in all the major financial centres and in particular in the Asian centres like Tokyo, because of what Linder calls the emergence or arrival of the Pacific Century[19] in place of the earlier American Century and still earlier, the British one or Pax Britannica of the nineteenth century.

For borrowing for financing infrastructure projects, the cost of borrowing from the international market can be reduced if such borrowing can be arranged along with assistance from multilateral international institutions like the World Bank. Such co-financing arrangements can enhance one's creditworthiness in the market and thus make it possible to borrow on favourable terms.

Integration: Such operations are not feasible without some degree of integration of domestic markets with international market—a purposive integration that induces the required capital inflow, while at the same time fosters and promotes the growth of the domestic financial markets.

To promote such integration, it is essential to develop investment banking expertise and computer and telecommunication facilities for rapid gathering, processing and transmittal of information, essential for decision-making. It may not be possible for domestic banks initially to undertake guarantee or underwriting obligations or to lead manage loans or issue of securities. However, it is possible and essential to develop the expertise and capacity to offer advice and assistance to domestic as well as foreign clients, particularly in the developing countries. The domestic banks are likely to have better information and understanding of the domestic and external resource requiremen of domestic firms—public or private—a well as of the domestic financial markets an the opportunities they offer; hence, the would be in a better position to offer advic to and formulate suitable proposals for th domestic firms, thus reducing the foreig exchange cost of external transactions. An once this capacity is developed, such advic and assistance can be given to the oth developing countries as well, thus exportin financial services on the basis of the dynamic comparative advantage.

Several Indian banks—commercial as we as development banks—have developed m chant banking expertise for offering adv to Indian firms with respeet to their ope

tions in the Indian markets. And the banking system has several branches abroad in major financial centres. Thus, it is not difficult for Indian banks to develop the capacity and expertise of operating actively in the international market as some of them like the State Bank of India are already doing to some extent. What is now required is a deliberate strategy for the purpose.

Only four banks—State Bank of India, Bank of Baroda, Bank of India and Indian Overseas Bank—have a significant presence abroad in terms of their branches; State Bank of India has 23 branches; Bank of Baroda 50, the Bank of India 25 and the Indian Overseas Bank 11—accounting in all for 109 branches out of a total of 122 branches for the entire Indian banking system. (Tables 9 and 10). These are the banks that have the institutional basis for operating in the international market, provided they develop the required expertise at the head office as well as in their branches. They need to have a strategy of using purposively their branches abroad for operations in the international market. So far, the top management of these banks have had no strategy with regard to their branches abroad and there was no proper guidance and assistance from the head offices to these branches with regard to their operations—largely because of lack of expertise and experience at the level of top management with regard to the international market and the obsessive involvement of the banking system, including the Reserve Bank of India, with the regulation of interest rates and credit allocation in India without much appreciation of the international context.[20]

It may be necessary for these banks to have a strong link with some international banks for evolving partnership relationships with regard to operations in the international market. In that case, the international banks can lead manage issues of securities or syndicated loans with or without guarantee or underwriting obligations, while the Indian partners could concentrate on the background work relating to formulation of proposals for client firms or institutions; such relationship should ensure equitable sharing of fees and margins between the two partners. Since some of the prominent international banks have branches in India, it should not be difficult to forge such relationships.

Attracting Foreign Investors to the Indian Market: India, like some other countries such as South Korea, has already evolved some financial instruments and institutions to attract foreign investors.

The Unit Trust of India (UTI) started in 1986 INDIA FUND in Guernsey and the India Growth Fund Inc in the US in 1988 in collaboration with Merril Lynch to induce foreign investors and particularly non-resident Indians (NRIs) to invest in the securities market of India. Further, India has attractive deposit schemes and other schemes for portfolio and direct investment in India for the NRIs. All these instruments are primarily developed to attract capital inflow from NRIs and that is quite a good tactical move. NRIs are quite familiar with India, have emotional and other links with India and a strong desire to be fully informed about Indian developments and also to contribute towards her development—particularly if that is also profitable for them. Further, once these instruments become established and well known as a result of NRIs participation, it may not be difficult to attract other foreign individuals and institutions to invest in these instruments.

With the experience gained so far, it may be desirable to offer these facilities for investment to all foreign individuals and institutions. In this effort, the branches of foreign banks in India can be very useful. They have been involved in attracting NRI investment and because of their experience, familiarity and links with the major financial centres, they are in a position to induce foreign investors other than NRIs to invest in India in the instruments currently aimed at only the NRIs.

These foreign banks have been useful also as a catalyst in generating competitive impulses even in the segmented financial markets in India. Though their business in India represents only about 3 per cent of the total for the banking system, about 24 foreign banks have 150 branches and are quite active in introducing financial innovations. The Standard Chartered is proposing to start a stock broking firm; Grindlays is trying to diversify and enter the fields of venture capital fund, leasing and mutual fund; and Citibank has already started a computer software subsidiary that now ranks third in the business of Indian exports in this field. The banks like the Citibank and the Hong Kong Bank have introduced innovations like Automatic Teller Machine and electronic gadgets that enable customers to perform banking business round the clock. The Citibank has now set the pace in terms of showing what a foreign bank can do in the field of retail banking; it has introduced new ideas relating to personal loans, service on telephone, etc. The Bank of America is going upmarket offering the services of personal banking officers to clients who are known in the business as high net-worth individuals. As the chairman of State Bank of India perceptively observed, the new edge to the competition from the foreign banks "has made us less complacent".[21] It has been a wise decision of the Indian authorities to let these foreign banks operate in India; they are a window to the outside world, an instrument for adapting foreign innovations to the Indian environment and also for integrating Indian markets with the markets abroad. They have provided a fresh breeze of competition in the highly administered system of Indian banking; their presence is an opportunity that can be exploited for forging vital links with the international market.

The other link which needs to be established is with the Emerging Markets Growth Fund (EMGF), sponsored by the International Finance Corporation (IFC) to purchase securities of developing countries' companies listed on foreign as well as domestic stock exchanges. The EMGF is investing in nine emerging stock markets; they include, in Asia, India, the Republic of Korea, Malaysia, the Philippines and Thailand; and in Latin America, Argentina, Brazil, Chile and Mexico. Other countries currently under consideration include Jordan, Nepal and Turkey.[22] The securities of companies, in which EMGF is interested in investing in the domestic market, can be later on listed in the markets of the major financial centres; the EMGF approval of such securities would enhance their attractiveness to foreign investors in foreign markets.

Of course, it would be essential to reduce the transaction cost of the foreign investors of dealing in securities of Indian firms by

streamlining legal and other administrative procedures. The attractiveness of Indian securities for foreign investors can be enhanced by deliberate and purposive elimination of transaction costs and risk, arising from *functionless* political and bureaucratic procedures or interventions, and reduction of other such costs and risk by innovative ways of handling such transactions with minimum delay, and adequate and timely provision of required information.

Integration and Interest Rate Policy: Integration of domestic with the international market implies that interest rates in India should be related fairly closely to the interest rates in the major financial centres. Since, countries like India would like to stimulate capital inflows and discourage capital outflows, domestic interest rates or yields, adjusted for expected exchange rate changes, on deposits and bonds should be higher than those prevailing abroad; and at the same time, to discourage excessive borrowing from abroad, the domestic interest rates or cost of borrowing should be lower than the cost of borrowing abroad, adjusted for expected exchange rate changes. Such interest rate policy can be implemented only if there are pressures and incentives for the domestic banks and financial markets to improve their efficiency of operations by reducing transaction costs for both lenders/investors and borrowers and an exchange rate policy that is consistent with and adequately coordinated with the domestic interest rate policies.

The domestic interest rate policies have also some relationship with the differential relating to domestic and foreign gold prices. The foreign investors and particularly the NRIs may prefer to invest in gold by purchasing gold abroad and selling it in India when the profit margins on such transactions are quite high. It appears from available evidence that the NRIs are selling foreign exchange to the gold smugglers for rupees at a premium of about 20-25 per cent above the official exchange rate; and the latter export gold illegally to India because of about 50 per cent differential between the domestic and international gold prices. Thus, the attraction of financial instruments for some NRIs is much less than for illegal transactions in the currency markets.

If the NRIs and the foreign tourists are permitted to bring gold to India with an import duty of 20-25 per cent on the value of gold, it is quite likely that the differential in the international and domestic prices of gold would be narrowed. And this for two reasons:

—because of freedom to import gold in India, the supply price of gold may become lower than what it is now; currently, there is a risk attached to gold smuggling.

—further, with such import of gold, the demand for gold with an investment motive may decline as the expectation of higher domestic prices may be damped.

If the price differential is narrowed, the NRIs currently selling foreign exchange to smugglers may be attracted by the other financial instruments, thus increasing the inflow of resources through official banking channels.

Even if the price differential were not narrowed, the situation would be better than what it is now. The government expenditure incurred to prevent gold smuggling would considerably diminish, government revenues would increase as a result of import duty on gold, and with a free market for gold, there would be possibilities for the Reserve Bank of India to use gold as an instrument for its open market operations, as well as for strengthening its gold reserves. Such gold imports may also facilitate larger exports of gold ornaments and jewellery, in which because of traditional skills, India has a comparative advantage. And the NRIs may, in that case, import them from India. Further, the black market in foreign exchange may shrink and there may result a closer alignment between the official and the black market exchange rates of the rupee.

Gold is a commodity unlike any other in the sense that it is durable, not subject to wear and tear, and internationally acceptable like any other convertible currency. Further, in India, for traditional reasons—sanctity attached to gold, its value as a reserve asset and its use in ornaments—the demand for gold is likely to increase, despite high prices,

at least at half the rate of growth of population. It is for these reasons that in spite of stringent gold control, illegal gold imports have continued for several years.

From the country's point of view, the private gold stocks can be mobilised in emergencies like a breakdown of the international monetary and financial system or a war and used as foreign exchange. Any way, the suggested policy measure is worth trying out for some years to find out its consequences, particularly as it does not involve any use of India's official foreign exchange earnings or reserves.

IV

Liberalisation of the Domestic Financial Markets

For gaining access to the international market as well as for improving the investment and productive efficiency in India, it is essential to reduce transaction costs and risk, relating to financial instruments, through financial innovations that provide a wider choice of instruments to savers/investors as well as borrowers. For this purpose, there has to be freedom from functionless legal and administrative restrictions on the functioning of financial markets and deliberate creation of a policy environment favourable for generating competitive impulses and for entrepreneurial functioning.

Competitive Impulses: The restrictions on the functional scope of financial institutions need to be progressively relaxed for creating a competitive environment. As is happening in the major financial centres, the commercial banks should be permitted to engage in investment banking activities, which are, as emphasised earlier, are essential for operating in the international market. Several banks have now entered the field of merchant banking, mutual funds, leasing, housing finance, etc, and they need to extend their activities to investment banking also.

The entry of commercial bank in this field is essential for another reason also. As is happening in the international market, the major corporate borrowers in India too are increasingly relying on the securitised markets for their resources. The banks are likely to lose this profitable market and if they are to be financially viable, they need to diversify their activities into fields like investment banking that make it possible for them to earn fees from domestic as well as foreign clients.

Such competitive and entrepreneurial impulses cannot be generated unless the top management of financial institutions has freedom from *ad hoc* interference from the government and other administrative controls and restrictions that prevent them from operating in an entrepreneurial manner. The fixity of tenure, at least for five years, for the top management of these institutions is imperative if they are to function as innovative entrepreneurs. Currently, the entrepreneurial talents of the top management have scope only in a vertical direction, that is, in accommodating the whims and caprices of the politicians and the bureaucrats rather than in the horizontal direction of improving their services to their customers. This has to change.[23]

Strengthening Money and Capital Markets: Several measures have been taken recently to promote and strengthen the securities markets in India. Discount and Finance House of India (DFHI) has already started its operations relating to short-term financial instruments. Credit Rating Information Services of India Ltd (CRISIL) has been established to rate companies as well as securities listed in the capital market. A national market has effectively been created by an electronic link-up between five major stock exchanges in India, which simultaneously transmits price information and other data to all exchanges. The Stock Holding Corporation of India (SHCI) has been formed by the financial institutions in order to provide clearing house facilities t promote speedier transfer of securities; th corporation acts as a central clearing agenc for registering of transfers of securities an reduces considerably the time-lag in effec ting transfers. Securities and Exchang Board of India (SEBI) similar to th Securities and Exchange Commission of th US has been set up to promote orderly an healthy growth of the securities market. A these developments seek to attract and pro tect investor interest by provision of bette and fuller information with regard to th companies, whose securities are listed in th national stock exchanges.

However, unless the financial institution are permitted to operate as brokers, dealers underwriters and investors in the money an capital markets, the growth and developmen of these markets may be inhibited. Variou types of banks should be permitted to assume such functions. In that case, it ma become possible to evolve a market in short-

term instruments by converting the present inter-corporate deposits into a negotiable commercial paper, making company deposits into a tradeable certificate of deposit and bills of exchange into what are known in the international market as NIFs. The markets for these instruments and the treasury bills need to be integrated with the active participation in these markets by the financial institutions including UTI, Life Insurance Corporation of India (LIC) and the Employees' Provident Fund (EPF); for this to be possible, restrictions on their investment portfolio need to be relaxed. The commercial and development banks, if they assume investment banking functions, could strengthen these markets in various ways. These markets can also be widened and deepened by securitising dormant assets like house mortgages and the like. The commercial and development banks too can securitise some of their assets as a measure of raising more resources for their functioning.

The promotion or strengthening of the market for short-term instruments through refinancing or rediscounting facilities with the Reserve Bank of India or Industrial Development Bank of India is not an effective or efficient method for the purpose; such facilities should be used sparingly and only as a last resort. They become necessary only when the financial markets are fragmented along with the interest rate structure because of administrative regulations. The viable method of strengthening these markets is through an appropriate interest rate policy.

Structure of Interest Rates: The fragmentation of financial markets has arisen partly because of the irrationality in the administered structure of interest rates. This structure does not reflect the differential transaction costs and risk attached to various instruments and this gives incorrect signals to investors/savers, lenders and borrowers and prevents integration of the financial markets as well as adaptation of appropriate financial innovations. The lack of integration is further aggravated through fiscal measures like exemption from tax on interest income from some instruments.

This structure hence needs to be rationalised. It may be necessary to have some administered rates but they need to be flexible so as to reflect the changing economic situation. However, even to know the levels at which such interest rates should be fixed and changed in the light of the developing situation, it is essential to have market determined interest rates, particularly related to negotiable tradeable instruments. On this logic, interest rates on bank deposits and government securities should be flexibly administered, while the financial markets and institutions should be free to determine the other rates including interest rates on loans.[24]

It may be necessary to direct credit to certain so-called priority sectors; but these sectors, to be priority sectors, must be very few like small farmers, small enterprises of all types and exports. As is done currently, credit to these sectors should be fixed as some proportion of deposits; but it is not necessary to fix administratively interest rates on advances or loans. Fixing both price and quantity would affect the viability of the banks if they strictly adhere to the directives; if they do not, they will be induced to raise the cost of borrowing by levying non-interest charges to such borrowers, thus adversely affecting the very sectors that are given priority status.

Credit allocation to such sectors through directives without fixing interest rates on loans would induce the banks to introduce such innovations as reduce transaction costs and risk to both lenders and borrowers and thus improve the effectiveness and efficiency of the banking system; at present, there is no such incentive and the financial viability of the banks is already undermined.

Exemption of interest income on some instruments from taxation does not appear to be the right instrument for raising the rate of financial saving; it merely provides artificial incentive for reallocating saving towards favoured instruments. For stimulating saving in terms of financial assets, it would be much more effective to exempt net saving—that is, increase in financial assets minus change in financial liabilities—from taxation; this would raise the net return on all financial instruments and discourage consumption, without fragmenting the financial markets. Such a modified expenditure tax can replace several separate taxes if the following tax base is adopted:

> (income from all sources + capital gains + gifts received)—[(increase in financial assets − change in financial liabilities) + gifts given to others + expenditure on one house meant for one's own use].

Such a tax would replace several separate taxes like income tax, capital gains tax, gifts tax and inheritance tax, thus simplifying the tax system, and at the same time stimulate financial saving.[25]

Prudential Regulation and Supervision: Liberalising financial markets from *functionless* administrative controls, regulations and directives does not mean that there should be no regulation and supervision of these markets. In fact, financial markets are fragile and susceptible to what Pigou calls errors of optimism and pessimism and in addition, unsound financial practices—like cheating, fraud and unwise hasty ill-informed decisions—have large cumulative and self-reinforcing external diseconomies as they affect the entire financial system and through it the productive sectors.

For this purpose, the institutional infrastructure is already in place. The Reserve Bank of India has this responsibility *vis-a-vis* the banking system; the Industrial Development Bank *vis-a-vis* the development banks; and the newly created Securities and Exchange Board of India *vis-a-vis* the securities markets. These institutions need to be strengthened in the light of the emerging needs that may arise as a result of liberalisation.

V
Concluding Observations

The international capital market as it has been evolving provides an opportunity for developing countries like India to attract the required capital inflow for accelerating their pace of development, manage their foreign exchange assets and liabilities to their advantage and develop export capabilities in the field of financial services. Active participation in this market would not only improve their access to the market but also indicate the institutional and policy framework essential for developing effective and efficient domestic financial markets. Of course, since participation does imply a progressive integration of domestic markets with the international market, it would make the domestic markets vulnerable to the vicissitudes of the international market. But as the Chinese say: by opening your windows you of course get flies along with fresh air; but if you don't open the windows, you will not get flies but at the same time, no fresh air either.

The possibilities of such participation would be enhanced if the developing countries like India take a constructive stand with regard to the multilateral negotiations in respect of trade in services under the Uruguay Round. Such active participation in negotiations would result into multilateral rules in the sphere of trade in services and safeguards for the developing countries, subject of course to eventual and negotiated erosion with 'graduation', perhaps even slower paced than as now discussed for goods.[26]

This would open out opportunities for ex[port] of services like financial services an[d] computer software, that are skill intensiv[e] and with regard to which countries like Indi[a] have a potential dynamic comparative ad[vantage]; further, the increased competitio[n] would also tend to improve the domest[ic] financial system, thus stimulating great[er] productive and investment efficiency in th[e] productive sectors.

Confrontation and rhetoric for speci[al] and differential treatment in the matter [of] trade as well as trade in services or for [a] international economic order arouse or[ ] hostility and are self-defeating. In fact a[s] has happened in the area of trade in goo[ds] that would give greater discretionary pow[er] to the administrative authorities in [ ] developed countries; without an agreed a[nd] negotiated system of multilateral rules, [ ] international system would provide opp[or]tunities for governments of the economic[ally] strong countries to dominate in one wa[y or] another (witness the Voluntary Ex[port] Restrictions—VERs—and Voluntary Im[port] Expansions—VIEs) the weaker ones.[27] [ ] to the advantage of the developing coun[tries]

to have an international system based on multilateral rules rather than political and economic power. And to have such a rule-based system, it is essential—nay, vital—for the developing countries to participate actively and intelligently in the negotiations for trade in goods as well as trade in services. Intelligent participation in negotiations would also indicate to the developing countries the areas in which the domestic institutional and policy framework needs change and improvement. Hostility and confrontation are possible with ignorance; co-operative ventures require intelligence and diligence.

Rural Social Transformation and Changes in Health Behaviour

Debabar Banerji

This paper discusses the findings of a wide-ranging study of health behaviour in nineteen villages spread over eight states and covering a time-span of fifteen years. The study, which has provided a range of information on rural social, cultural and economic transformation on the one hand and changes in health behaviour on the other, highlights the close correlation between the two and brings out that change of health behaviour can be considered as one of the indices of the degree of rural transformation.

EARLIER studies on health behaviour were conducted along the tradition of village studies. They suffered from profound ethnocentric biases in data collection and in analysis and interpretation of the data. Some more influential of these are briefly mentioned below.

Two cultural anthropologists from foreign countries—McKim Marriot [1955] and Morris Carstairs [1955] were among the first to carry out 'formal' social science studies in health in India. Both of them lived in villages for considerable periods to present the contrast between western and rural Indian medicine in terms of doctor-patient relationship.

Marriot carried out his study in the village Kishan Garhi in Aligarh district of Uttar Pradesh in 1952. He attempted to analyse the cultural problems involved in introducing what was considered to be more effective medical techniques to a 'conservative' village. He describes the overall social organisation of the village, then analyses the village medical institutions in particular, and finally re-examines the role of the western doctor as it appears to villagers in the context of their own social organisation and their own medical institutions. Analysis reveals several contrasts and conflicts that have existed in the past between the roles assumed by indigenous and by western medical practitioners, conflicts that have acted as obstacles to the spread of western medicine. The analysis also points to certain resemblances between the roles of indigenous and western medical practitioners and suggests how some of these resemblances might be exploited in establishing what the author terms as 'scientific bridgeheads'. The successful establishment of effective medicine here appears to the researcher to depend largely on the degree to which "scientific medical practice can divest itself of certain western cultural accretions and clothe itself in the social home spun of the Indian village". The value position of the researcher is quite obvious.

Carstairs conducted his studies in 1951 and 1952 in two villages—Surajpur and Delwara—located in the extreme north of the then Udaipur state. He was familiar with this region because his father was a missionary and he grew up there. Significantly, he starts his presentation with a reference to a short story by Rudyard Kipling where he describes how a young district officer persuaded a frightened village community to submit to vaccination by reminding the people that its effectiveness is derived from the sacred cow, and then getting one or two leading men to be the first to undergo it.

His conclusion was that to the people of rural India sickness is as much a moral as a physical crisis. Villagers can scarcely be expected to change their whole cosmology simply to accord with the outlook of a western trained doctor. According to him those who are interested in introducing western technology in public health and medicine ought to study how they can adapt the roles of the doctor and other health workers to fit in to the existing cultural expectations. In the process they may have to consent to assume the mantle of the priest or the magician. Carstairs hastens to explain that by this he does not mean the western doctors will themselves subscribes to 'non rational' beliefs, but simply that they will accept the inevitable fact that their own techniques of healing will be accepted 'irrationally'. Carstairs contends that western health personnel can, however, turn this fact to advantage by dramatising the concepts of infection, sterilisation and chemotherapy for all their worth and by accepting as an asset the quite unscientific awe which the ritual of even minor surgery can inspire. He concludes that these considerations may sound devious and machiavellian, but "as long as western trained worker remain clear in their own minds about the worth of the contribution they have to make to the community's well-being, they will be able to play their roles with that conviction and assurance of ultimate success which the villagers themselves recognise as the hallmark of true potent therapy".

Khwaja Arif Hasan [1967] has been among the first scholars (1959-60) to have carried out field work specifically to elaborate on cultural dimensions of health in an Indian village. The village selected by Hasan is atypical in many ways—it is near Lucknow city, it is a part of the field practice area of the department of preventive and social medicine of KG Medical College, Lucknow and the study population had a disproportionately high representation from the Muslims and lower castes. The author stayed in the village for full one year and conducted participant observation, besides analysing available records and administering a voluminous questionnaire to a purposive sample of 80 out of a total of 215 households. In the report he describes the village environment, sanitary habits, personal hygiene, food habits and taboos, drinks and drugs, concepts of aetiology and illness and doctor-patient relationship. He has pointed out the factors that directly affect the health of a community because of certain customs and practices, beliefs, values and religious taboos and those that indirectly affect the health of the community. Some of the cultural factors play a positive role while others have negative influence on the health of the village community.

Other scholars like van der Veen [1981], Nichter [1981], Khare [1981, 1963], Parker et al [1979], Kapur [1979], Carstairs and Kapur [1976], Bhatia [1975], Bhardwaj [1975], Leslie [1967] and Opler [1963] have also reported on health behaviour of rural populations on the basis of their field studies (Charles Leslie [1988], Giriraj Gupta [1981] and Ahluwalia [1972] have also provided reviews of studies in this area).

Looking from the other end, Sikand and Raj Narain [1957] reported that only 42 per cent of sputum positive tuberculosis cases discovered in the course of a sample survey of the population of Delhi city were 'known' to tuberculosis institutions in Delhi. If this logic is carried to the situation prevailing in rural areas, where virtually no tuberculosis institutions existed at that time, then all the tuberculosis cases were 'unknown'. Such an approach to analysis once again takes a very narrow, technocentric view of behaviour of tuberculosis patients—they must go to a specialised clinic, if they were to be classified as 'known' cases. More unfortunately, this data were used to justify the recommendation of use of the very expensive and highly complicated method of 'catching' the 'unknown' cases through the use of mass miniature radiography.

From the hindsight of the past quarter of a century, it is apparent that the forecasts of scholars like Marriot, Carstairs, Hasan, Guld and Khare that rural populations will resist western medicine unless major modifications are made in the delivery system have not turned out to be true. They were so preoccupied in obtaining data which made them think of ways of manipulating people (e g, the Kiplingian gimmicks su

gested by Carstairs) and/or manipulating the practitioners of western medicine to overcome the alleged resistance, that they did not ask the very obvious research question: why, even in the fifties, were villagers taking all the trouble and expense of visiting hospitals in urban areas even when they were dealt with so shabbily there and even when these institutions so often failed to alleviate their suffering?

The failure to raise such vital research questions was perhaps due to their taking a value position in favour of western medicine and against the traditional practices of the so-called backward rural population. This has profoundly biased both the conceptualisation of their research problems and the methodological approaches adopted by them.

There was a blanket admiration for western medicine: it was considered to be 'good' and the traditional practices were 'not good'. Marriot, for instance, considered the smelly shark liver oil and the calcium tablets prescribed by a missionary doctor (who was persuaded by Marriot to visit Kishangarhi) as a 'superior' treatment of tuberculosis than the 'gold' and 'honey' treatment prescribed by the local medicine man. Carstairs' approach was even more derogatory and condescending to the local cultural practices.

One outcome of such an obvious bias in the study of way of life of the villagers was that it came in the way of studying the culture in its entirety. Some specific aspects of the culture, which tended to justify the preconceived notions of the researchers, received disproportionately greater attention than the rest. There was a 'selective' approach to the study of health behaviour.

These scholars studied health behaviour of people in isolation. It was not adequately realised that it is a mere component of the overall cultural response to problems faced by the population. Health behaviour is related to cultural perception of health problems. Culture also determines the meaning of health problems to the people. Again, culture mediates in the formation of various institutions and functionaries for coping with the problems. Thus, health behaviour ought to have been seen only as a component of a complex whole; if health behaviour is not seen in that holistic context, there is a real danger of its getting distorted in the process of study. This conceptual aberration which, in turn, distorted the methodology, seems to have vitiated many of the earlier health hebaviour studies.

This trend of social science thinking in health ('medical sociology') has also shaped the basic thinking in the conventional approach to the discipline of health education. As practitioners of this brand of medical sociology, health educators in India took a pronounced value position: that western medicine, as embodied in the government health and family programmes, are 'good' and that they must bring about changes in the so-called superstitious, illiterate, ignorant, tradition-bound rural people so that they are made to accept (motivational manipulation) what is handed down to them by government agencies [Mahler 1982; Banerji 1986]. Health educators enthusiastically welcomed the 'change' models of western scholars like Hochbaum [1965], Katz [1952] and Rogers [1948] in developing theory and practice of health education in India. Again, with the hindsight of the past quarter of a century, it can be understood why such victim-blaming, patronising and manipulative efforts have not yielded the desired results. India's family planning programme [Bose 1988] and UNICEF's effort to promote what it called 'social marketing' [Manhoff 1984] to 'sell' immunisation programmes are glaring instances of the failures of the traditional approach to health education.

Cultural Correlates of Health Behaviour

Social science studies conducted in the early sixties at the National Tuberculosis Institute, Bangalore (NTI) [Banerji and Andersen 1963; Banerji 1971] deserve special attention as they were qualitatively different from most other studies in more than one sense. The NTI was given a specific mandate to formulate a nationally applicable, socially acceptable and epidemiologically effective national tuberculosis programme for India. All its research activities revolved around this mandate. An inter-disciplinary team was formed to perform this task. Social scientists were recognised as members of this team and they worked with public health administrators, epidemiologists, specialists in tuberculosis diseases, microbiologists, public health nurses, radiological engineers and statisticians to carry out the task assigned to the institute.

Because of their different orientation, the social scientists asked different types of questions regarding the problem of tuberculosis in India. They did not follow the traditional line of finding ways of 'manipulating' tuberculosis patients so that they participate in 'case-finding' and 'case-holding' operations launched through mass radiography or tuberculosis clinics. Nor did they follow the footsteps of scholars like Marriot or Carstairs in writing detailed accounts of exotic health practices in 'traditional' societies. They decided that the formulation of a national tuberculosis programme should start from an understanding of the people concerned: they "went to the people to learn from them". The research questions were: how do tuberculosis patients in a rural community respond to the disease? How many are at least conscious of the symptoms of the disease? To how many are the symptoms cause of worry and how many take action about their symptoms? In other words, the research was meant to give a sociological dimension to the epidemiology of tuberculosis in the country. Closely following an epidemiological survey of tuberculosis in Tumkur district of Karnataka [Raj Narain et al 1963], a careful sociological study was designed at the sociological section of NTI in 1960 [Banerji and Andersen 1963] to measure the degree of awareness of the patients in terms of 'consciousness', 'worry' and 'action'.

The findings from the study were very revealing. At the time when there was a strong tendency to seek the help of social scientists to 'catch' people for mass radiography, it was found that, motivated by the suffering caused by the disease, as much as half of all infectious cases in the population had sought assistance from government rural health institutions and almost invariably they were sent back from there with a bottle of cough mixture. Another quarter of the cases were worried about the symptoms (chronic cough, fever, chest pain and blood in sputum) and almost all of them (95 per cent) were at least conscious of them.

'Defaulting' in drug intake by patients in the course of implementation of the national tuberculosis programme was another area studied by social scientists of NTI [Andersen and Banerji 1963; Singh and Banerji 1968; Banerji 1971]. These studies revealed that by far the greatest 'fault' lay not with the patients as was then generally supposed, but with those who were responsible for lapses in the organisation and management of the programme—in supply of drugs and X-ray films, in availability of the recommended trained staff, in integration of the service, for instance. Technical considerations regarding definition of a case of tuberculosis also contributed to the number of 'defaulters' because many of those who were branded as cases of tuberculosis were not cases at all and some of the tuberculosis cases were resistant to the treatment. The patients obviously cannot be branded as defaulters because of 'defaults' in the organisation and in technological assumptions. Finally, in the small group in which the lapse in drug intake was entirely due to faults of the patients, it was found that apart from the very human tendency to forget, often very acute social and economic factors were responsible for this default. These studies [see, for instance, Mankodi and van der Veen 1985; Aneja and Samuel 1982; Narayan and Srikantaramu 1987; Seetha and Kale 1986 and Baily et al 1974] revealed once again that many of the social science studies on this problem were out of focus because of value positions adopted by the research workers.

Thus, a much more systematic way of conceptualisation of the problem of health behaviour and paying much greater attention to methodological issues led to findings which seriously called into question the conclusions about health behaviour of rural populations drawn from the earlier 'village studies'. The sociological studies in NTI were of far-reaching significance, not only in the formulation of India's National Tuberculosis Programme [Banerji 1971], but also in identifying some major concepts in medical sociology. Two of these concepts, which have

already been referred to earlier, are mentioned below.

The findings showed that health behaviour of a community cannot be studied in isolation. It is influenced by the degree of access to effective services. These two (i e, health behaviour and access) also interact with cultural perception and meaning of a health problem. Because of improvement in the access to effective services, the earlier perception that tuberculosis is a stigmatising disease, almost invariably ending in death, has changed considerably. Therefore all these factors should be considered together. This interacting complex whole has been termed as health culture. The most significant finding was that there was an area of overlap of felt need and epidemiologically assessed need: it gave an entirely new direction to programme formulation—away from conventional approach of mass radiography, mass BCG inoculation and specialised tuberculosis clinics. It enjoined that the first priority be given to those epidemiologically assessed cases who also had felt need for services. As this principle can be generalised to cover a wide range of community health problems, it forms the cornerstone of the new social science approach to health.

There have been a number of other studies—'village studies'—which have analysed the issue of health behaviour of rural population within a wider framework. Some of them are mentioned below.

Djurfeldt and Lindberg [1975: 216] conducted study of introduction of western medicine in the village Thaiyur in Tamil Nadu in 1969-70 and concluded that as "the health situation in the village was consequence of the prevailing economic and political order, both the western and indigenous systems of medicine are equally impotent in dealing with the health situation; and only a profound transformation in the economic and political structure can give the people of Thaiyur the means to improve their health". In a study of yet another group of Tamil Nadu villages, Sheila Zurbrigg [1984] has looked at continuing ill-health in India through the life of a labouring village woman, exploring the forces which keep her from adequately feeding and caring for her children and herself. She advocates a shift of attention and efforts of health workers to the poverty-dependency-ill-health dynamics, and suggests how issues of ill-health can be used to strengthen the broader struggle by the labouring poor for health and social justice.

Research students at the Centre of Social Medicine and Community Health of Jawaharlal Nehru University have also conducted some significant studies. Studying six Oraon tribal communities living at varying distances from the sophisticated hospital at the steel plant at Rourkela, Santosh Kumar Sahu [1980] had observed that changes in the access to western medical services had profoundly changed the other components of their health culture. Furthermore, he found considerable degree of unmet felt needs for western style medical services even in the remotest Oraon village and that when medical catastrophes strike them, they are prepared to make great sacrifices to gain access to practitioners or institutions of western medicine.

Studying the interaction between the people and Integrated Child Development Scheme (ICDS) in a tribal block in Orissa, Santa Raye [1982] observed that many of the major shortcomings in the implementation of the ICDS could have been avoided had the organisers developed a people oriented programme, instead of imposing a pre-determined package of services on the people.

Conducting a community study as a component of analysis of the National Leprosy Control Programme (LCP) in Chingleput district of Tamil Nadu as a system, K V Rao [1982] found that perception of stigma in a community is confined mostly to those cases who had developed deformities. Cases develop deformities because they are not diagnosed and treated during the long pre-deformity phase of the disease, quite often due to lapses in the implementation of the LCP. Also, carrying out a study of treatment behaviour along the NTI lines, Rao demonstrated that in the case of LCP also, failure of many patients to continue the prescribed treatment could be due to inadequate epidemiological analysis in defining a case and to inadequacies in the implementation of the programme.

A Broadbased Study

The experience from the sociological studies at the National Tuberculosis Institute led in 1972 to conceptualisation of broader based studies of health behaviour of rural populations in India against a much wider social and cultural setting [Banerji 1982]. This included study of behaviour in relation to a much wider spectrum of health problems, in their curative, preventive and promotive dimensions. Community response to the family planning programme was also included. Another important feature of the research design was that study of health behaviour was developed around an integrated concept of the entire way of life in rural populations, which included such key areas as social and biological meaning of poverty, social, economic, demographic and political determinants of poverty, relationship between caste, religion, class and politics and interaction between different segments of a rural community, on the one hand and the different programmes for development, including the 'agents' who deliver the programmes, on the other.

The most significant feature of this study was that the entire methodological edifice was built around such an integrated concept. Depending on the linguistic competence of the investigators, nineteen villages, covering the states of Gujarat, Haryana, Karnataka, Kerala, Rajasthan, Tamil Nadu, Uttar Pradesh and West Bengal, were selected for a field work type of investigation of health behaviour in the context of the social and cultural setting. To study the influence of access, eleven of the villages also had a fully staffed primary health centre (PHC) and two had a sub-centre of a PHC.

Apart from collecting data through village informants—panchayat members, school teachers and other formal and informal village leaders—the investigators identified informants and some 'ordinary' members from *each segment* of the village community and made observations and conducted depth interviews to understand the health culture of the village against the background of its total culture. They also prepared case reports to provide a deeper insight into the response of the different segments to a very wide variety of health problems, covering the fields of medical care, family planning, maternal and child health, communicable diseases, environmental sanitation, etc. Their stay in the villages also enabled them to make direct observations, followed by depth interviews, of the actual behaviour of the villagers when they encountered certain specific health problems. They could also study the interaction between the PHC personnel and the villagers, both when the former visited the village and when the villagers visited the PHC. Apart from these efforts to ensure that in-depth qualitative data were obtained from *all* the segments of the entire village community and they were, as far as possible, checked and cross-checked, a quantitative dimension was given to some of the main qualitative data by framing an unstructured interview schedule on the basis of these qualitative data and administering it to a 20 per cent stratified random sample of the village households.

Taking into account the social an[illegible] economic status of the people, the epi[illegible] demiology of health problems and th[illegible] nature of the health services available, it i[illegible] not surprising that problems of medical car[illegible] should be by far the most urgent concer[illegible] among the health problems in rural popula[illegible] tions. But the surprising finding is that th[illegible] response to the major medical care problem[illegible] is very much in favour of the wester[illegible] (allopathic) system of medicine, irrespectiv[illegible] of social, economic, occupational an[illegible] regional considerations. Availability of suc[illegible] services and capacity of patients to meet th[illegible] expenses are the two major constrainin[illegible] factors.

On the whole, the dispensary projects [illegible] very unflattering image. Discriminati[illegible] against the poor and the oppressed, po[illegible] quality of medicines (only red water), la[illegible] of medicines, over-crowding and long wa[illegible] nepotism, bribery and indifferent and oft[illegible] rude behaviour of the staff are some of t[illegible] charges that have been levelled against m[illegible] of the dispensaries. Complaints abo[illegible] medicines and over-crowding and long w[illegible] are made even against the best of the PH[illegible] studied.

Because of the very poor image of [illegible] PHC dispensary and its limited capacit[illegible]

is unable to satisfy a very substantial proportion of the demand of the villagers for medical care services. This enormous unmet felt need for medical care services is the main motive force in the creation of a very large number of the so-called Registered Medical Practitioners (RMPs) or 'quacks'. The RMPs are thus in effect created as a result of the inability of the PHC dispensary or other qualified medical practitioners to meet the demands for medical care services in villages.

Apart from these, depending on the economic status of the patient and the gravity of his illness, villagers seek help from government and non-government medical care agencies in the adjoining (or even distant) towns and cities. There are several instances of families having been totally ruined in the process of meeting medical care expenses for major illness of the breadwinner or of other family members.

There are numerous instances of adoption of 'traditional' healing practices. But among those who suffer from major illnesses, only a very tiny fraction preferentially adopt these practices, by positively rejecting facilities of the western system of medicine which are more efficacious and which are easily available and accessible to them. Usually these practices and home remedies are adopted: (i) side by side with western medicine; (ii) after western medicine fail to give benefit; (iii) when western medical services are not available or accessible to them due to various reasons; and, (iv) most frequently, when the illness is of minor nature.

A very significant finding of this study is that the family planning programme has ended up in projecting an image which is just the opposite of what was actually intended. Instead of projecting an image which reflects respect for dignity of the individual—the so-called democratic approach which offers free choice of methods to the users and which ensures better health services—the image of the family planning workers in rural areas is that of persons who use coercion and other kinds of pressure tactics and offer bribes to entice people to accept vasectomy or tubectomy. There are, on the other hand, a few workers, who invoke the pity of community leaders by making pathetic entreaties to them to 'give' them some cases to save them from losing their jobs. To a large section of the villagers, the inverted red triangle and the workers behind the banner invoke a feeling of strong antipathy.

There have been numerous complaints from the villagers that they got no help from the organisations when they encountered complications following acceptance of family planning services—IUCD, vasectomy and tubectomy. These dissatisfied acceptors have been allowed to freely spread scare stories regarding these methods. Failure to provide even a very rudimentary system of health services, particularly curative services, has tended to reinforce this negative image.

Because of failure of workers to develop rapport with the villagers, sometimes the villagers are unable to meet their needs for family planning services. Negative response invoked by the high handed attitude of the family planning workers and the single method mass approach usually adopted by them often obscured the fact that many villagers actively seek family planning methods of their choice and these demands remain mostly unmet due to lack of response from the field workers.

There are several instances of mothers, who, failing to get suitable family planning services from the PHC, took recourse to induced abortions to get rid of unwanted pregnancies. This not only points to the failure of the programme to meet their needs for the services but it also draws attention to the failure of the programme to offer suitable abortion services to mothers with unwanted pregnancies, despite the passage of the abortion bill.

Most of the Nirodh users have to get their supply from the commercial channels. The depot holders are virtually non-existent and the free supply from PHC, according to some villagers, often finds its way into the market and is sold through the commercial channel.

The supply of iron and folic acid tablets and tetanus toxoid injections to pregnant women, immunisation and nutrition programmes for pre-school children and vitamin supplements to the population, all of which are supposed to be offered by the family planning programme, are virtually unknown in the 19 villages studied in 1972-75.

Another very significant finding of this study is that there is considerable unmet felt need for the services of the Auxiliary Nurse Midwife (ANM) at the time of child-birth. Villagers are keen to have the ANM's services because they consider her to be more skilled than the traditional *dai*. Wherever the ANMs have provided services, the *dai's* role has become less significant. It is significant that even those ANMs who have tarnished their image by openly carrying on extra maritial affairs within the village continue to command respect from villagers.

The overall image of the ANM or the Lady Health Visitor (LHV) in villages in north India is that of a person who is quite distant from them—meant only for special people or for those who can pay for her services. She is not for the poor. She can be called only when there are complications and then also she should be paid. She is not expected to visit them during the pregnancy or after the delivery. In the villages in the south, the position is (only) relatively better, though there also the utilisation of the ANM is much below the optimal level, thus leaving substantial unmet felt needs. Antenatal and post-natal care of the mothers, as well as care of the children are virtually absent even in the villages where PHC have been functioning for a very long time.

Lady doctors, whenever available, are even more inaccessible than the LHVs an ANMs. The villagers actively seek their hel or even take the patients to the city hospita in the case of intractable obstetrical com plications. These data once again belie th prevailing notion that the illiterate, super stitious and ignorant villagers do not accep offer of scientific health care services and instead, they go for primitive healt practices.

Local *dais* conduct the majority of th deliveries even in the villages where the PH is located. In the villages with no PHC, thei sway is almost complete. It is noteworth that they seek help from the ANM, LHV o lady doctor for complications which they ar unable to manage. Use of unclean instru ments and adoption of cruder methods b the *dais* and relatives and friends are hel as cause of the much more frequent occur rence of neo-natal tetanus and other com plications. But, in contrast with the ANM and the LHV, the *dais* either do not cos anything or their charges are moderate, the are easily available and accessible at an hour of the day, they readily pay repeate visits to the mother during the pregnancy labour and after labour, they perform such chores as massaging of the mother, looking after the infant, washing the clothes and disposing of the placenta and other soiled material and, above all, being a useful integral part of the village social system, they inspire confidence among the villagers and unlike the ANMs and LHVs, they do not subdue them by their curt or even rude behaviour. As in the case of the RMPs confinement by relatives and friends and the indigenous *dais* is popular among the villagers not because of their intrinsic merits but, in the absence of suitable services from the ANM/LHV/lady doctors, they are compelled to settle for something which they consider to be inferior but which is all that is available and accessible to them.

Social Transformation and Changes in Health Behaviour

Originally, the study of the nineteen villages was visualised as a one time investigation and all the villages were covered during 1972-75. Launching of the intensified family planning drive during the emergency (1975-76) was the immediate stimulus to pay a revisit to all the villages to assess the community response to the intensified drive. With the very good rapport which had been developed during the first visit, it also became possible to give a time dimension to the findings observed earlier and to recheck some of the key findings. The data collected through the first revisit turned out to be very valuable. This inspired a number of revisits on similar lines, culminating in a much more extensive collection of both qualitative and quantitative, covering all the nineteen study villages, in 1987-88, to get an integrated account of the socio-cultural, economic, demographic and political changes and changes in health behaviour during the

significant period between 1972-1988. In between, each village had, on an average, four revisits.

Organisation, analysis and interpretation of the very large volume of qualitative and quantitative data collected over a time span of fifteen years needed very great efforts. A report entitled: *Poverty, Class and Health Culture in India* [Banerji 1982] was prepared, mainly to present, in the time perspective of 1972-1981, an account of socio-cultural, economic and political changes in the study villages and their broad linkages with health behaviour and with government-run health services and other health institutions. Much more work remains to be done before a comprehensive report of the entire study, covering the time span of fifteen years, is finalised. Some of the major findings from the first visit, along with the trend of changes in the social setting and in the health behaviour of the same population over a fifteen year period, are presented below as a preliminary communication on the research.

During the first visit, there was extensive prevalence of poverty and hunger. There was virtually no potable water supply in any of the villages. The environmental sanitation and housing conditions were very bad. Nevertheless, in spite of the very degrading conditions of living for the bulk of the population in these villages, there have been efforts to 'develop' them. Besides, many persons who were relatively well off had brought about changes in the social setting through their efforts.

These changes were manifested in the form of development of roads, transport system, electrification, post and telegraph and telephone communication facilities, use of radios and a few television sets, expansion of the education system, opening of branches of commercial banks, formation of co-operatives, modernisation of agriculture in the form of use of chemical fertilisers and pesticides, high-yielding varieties of seeds, irrigation pumps, tractors, etc, shopping facilities, markets for sale of agricultural produce, small repair shops, setting up of industries of various kinds, and so forth.

By that time there has also been considerable expansion of the government-run rural health services, doing curative, preventive, promotive and family planning work. Significantly, there has also been a major expansion of the 'private sector' in the curative fields in the form of medical practitioners of various kinds, chemist shops and maternity homes and nursing homes.

There have also been some growth of political institutions in the form of panchayat organisations, with political parties showing growing interests in elections to various bodies.

Even from a preliminary analysis and interpretation of the very limited data on the changes that have taken place over a period of fifteen years, it is possible to come to some very broad conclusions about rural social transformation and changes in health behaviour. While arriving at these conclusions, it was constantly kept in mind that this period of fifteen years has included some major upheavals in the country in social and political fields. These included the emergency period of 1975-77. It also included the political upheaval of 1977 and the corresponding changes in the political leadership in the union and in many of the state governments.

The study villages were also very different from one another, both from socio-economic and health behaviour points of view, as they belong to eight different states and as some of them also happen to be block administrative headquarters with PHC located in them. Besides, there have been several efforts at mobilisation of the voters for the many elections that have taken place for gram panchayats, panchayat samitis, zilla parishads, state legislatures and the lok sabha.

One overwhelming finding at the end of about fifteen years since the study was started is a more than 50 per cent increase in the total population of the villages. What is more significant, this population growth has not taken place evenly in all the villages. As given in the table, Amdanga has actually shown a decrease in population; in five other villages, the growth has been about half or less than the overall average. At the other extreme, Haringhata has registered a population growth of 325 per cent, in another three the range of the growth is from 93 to 140 per cent.

An equally remarkable finding of this study is that even this massive overall growth of the population in the villages has not confirmed the simplistic predictions made by Malthus and his present day disciples. The growth has undoubtedly been exponential at rates of more than two per cent per annum. But this has not led to the famines, wars and epidemics, as predicted by Malthus. An explanation for this phenomenon can be found in the pronounced social and political changes that have taken place in these villages during the same period.

Perhaps the most remarkable finding from this study is the significant growth in the momentum of the democratic movement within the study population. It may be pointed immediately that this momentum is being visualised in a relative sense. A very long way is yet to be covered before the people in the villages are able to actively participate in the decisions which concern them. However, starting from the democratic movement during the freedom struggle, there has been a sustained progress since independence. The situation existing between 1972-1981 has been described in considerable detail in *Poverty, Class and Health Culture*. The subsequent years have revealed an increase in the consciousness among the masses.

Another interesting feature of the changes that have taken place during the past decade and a half is the rapid development of the system of communication and transportation between the villages and the world outside. This is in the form of very rapid increase in the number of the radio sets. There has also been a remarkable increase in the number of television sets in the villages. The villagers also use telephones more frequently. There is also a sharp increase in travel by road to the nearby towns and to the state capital. This change in the village population is a part of the wider political changes that have taken place at the block, district, state and national levels.

There has also been a sharp rise in the interest of the villagers in the affairs of the panchayats. In many villages there is also active participation in the co-operative movement. The rural employment scheme has also generated some confidence among the oppressed sections of the population.

Concurrent with the very heartening

TABLE: GROWTH OF POPULATION IN THE STUDY VILLAGES (1971-1988)

Villages	1972	1988	Per Cent Change
1 Amdanga (WB)	1724	1431	−17.0
2 Kamdevpur (WB)	1687	1906	13.0
3 Pazhambalakode (Kerala)	3592	4272	18.9
4 Coyalmannam (Kerala)	3012	3700	22.8
5 Pullambadi (Tamil Nadu)	6026	7511	24.6
6 Jadigenhalli (karnataka)	1163	1488	27.9
7 Kalur (Karnataka)	572	754	31.8
8 Bilaspur (Haryana)	557	767	37.7
9 Rupal (Gujarat)	1710	2578	50.3
10 Rohata (UP)	7009	10546	50.5
11 Arnavali (UP)	1772	2678	51.1
12 Dakshin Dutta Para (WB)	661	1105	67.2
13 Rohat (Rajasthan)	2459	4280	74.1
14 Kachhona (UP)	2289	4048	76.9
15 Yelwal (Karnataka)	1608	2858	77.7
16 Sunni (UP)	928	1795	93.4
17 Rampura (Rajasthan)	534	1035	93.8
18 Gombhoi (Gujarat)	500	1200	140.0
19 Barajaguli (WB)	1128	4800	325.5
Total	38931	58744	50.9

developments among the masses of the people, the follow up studies have also shown that there has been a rapid increase in the polarisation between privileged classes, castes and other sectional interests, and the rest of the population. It is the interaction of the interests of the increasingly powerful class and castes and other groups and those of the masses of the people which has shaped the pattern of the remarkable social transformation and the remarkable changes in the health behaviour that have been observed in this study.

The initial round of the study had revealed extensive prevalence of poverty and human degradation in many of the villages. The past fifteen years have shown significant changes. In some of the villages the changes are for the better; in others it is for the worse. However, taken as a whole, it can be conjectured that the situation has improved, despite the rapid increase in the total population.

The general conditions in the villages as a whole have certainly registered very significant improvements. As pointed out above, there are remarkable improvements in the development and use of communication and transportation systems. There is also a very rapid expansion of the government sponsored credit and banking system. The public distribution system for providing foodgrains and other essential items at fair prices has also expanded rapidly. There has been rapid increase in the use of tractors, irrigation pumps and chemical fertilisers. Many more villages have been electrified and many more houses have availed of electric connections. Notable changes have taken place in terms of water supply, nutritional services and housing conditions. Marketing facilities have grown and enterprising villagers have availed of the communication and transportation facilities to reach markets far beyond the traditional marketing system they have been using earlier. There is also a significant increase in the local economic and employment generating activities of various kinds. There is very large increase in the types of goods available in the villages themselves. There are also a number of repair shops to service the many modern gadgets and tools that are being used within the villages. Establishment of bigger industrial ventures near some of the villages (e g, a textile mill or a dairy farm) has spurred economic activities in these villages. Increasing affluence of some of the villagers has also created a larger market for entertainment establishments, such as cinemas and theatres.

Another remarkable change is in the form of rapid expansion of the rural health service system. From the earlier pattern of having one primary health centre and ten subcentres for a population of 1,00,000, there is now one primary health centre for a population of 30,000 and a sub-centre with a male and female worker for a population of 5,000 with the old primary health centre being redesignated as the community/block health centre. The latter is expected to have a bed strength of 25-30, with specialists in four clinical areas. A still more remarkable feature of this process of expansion was the government commitment, in the wake of the political upheaval in 1977, to entrust "people's health in people's hands" by allowing them to choose a community health worker (CHV) from among the villagers themselves for every 1,000 population, so that the villagers can acquire the power to cope with their own health problem as far as possible. This scheme visualised that the villagers will use the CHVs to demand assistance from the rest of the health service system, when the health problems need competence of a higher order.

Many of the above decisions, taken more than a decade back, have not been implemented in many of the PHCs in the study area. Worse still, there has been a further sharp decline in the efficiency of the rural health services. Corruption among the health workers has become more rampant and blatant.

The formation and the functioning of the health services in rural areas very aptly reflect the two opposite forces that are at work in Indian society at large. At one end is the increasing democratic aspirations among the masses of the people of the country which have impelled the political leadership to concede more and more resources to the rural sector. At the other extreme is the class character of the political and administrative decision makers which is responsible for the sharp deterioration in the quality of the services provided. When seen against the nature of the power structure in the study villages [Banerji 1982], it was quite apparent that people's health could not be placed in people's hands as the community health workers 'chosen' by the village community do not reflect the aspirations of the rural people, least of all those of the poor and the oppressed.

Along with the widespread cultural, social, political and economic changes that have taken place in the study villages, there has been a very significant change in the health behaviour of the population. 'Felt needs' among the people for getting (allopathic) medical services to alleviate the suffering caused by the various health problems has now increased even more rapidly. This has generated greater demands for more and more medical care services. The lack of response from the government health agencies to meet the needs and demands of the people has created a 'market' for the private sector. One very remarkable feature of the transformation that has taken place in the study villages is the proliferation of the medical services of different kinds. There is a very large increase in the number of chemist shops. A large number of MBBS doctors have opened their office-cum-medicine shops in villages. Various diagnostic services are now available in some villages. There is also expansion of the rudimentary nursing home facilities observed earlier. Over and above, when the 'market' is not found adequate for the more 'skilled' health personnel and institutions, there has been expansion of the RMPs.

It was observed that even though those who could get the money spent heavily to seek medical services from the private sector, both within the village and outside, the results have not been very satisfactory. This was very clearly exemplified by the cases of tuberculosis in the study villages. A felt-need oriented national tuberculosis programme has been in operation in the country since the early sixties [Banerji 1971]. However, it was observed that the programme was not being implemented adequately in any of the eleven PHCs studied. In fact, the programme has suffered because of the decline in the quality of the services over the period. One consequence of this decline is the creation of market in the private sector. The private sector has gleefully 'caught' the tuberculosis cases and extracted money from the victims for various therapeutic and diagnostic services, which are often neither scientifically justifiable nor ethically sound. The unfortunate victims are left to their fate once they exhausted all sources of getting the money to meet the heavy expenses for their treatment. The result of this state of affairs is that during the last visit of the study villages it was observed that there were a large number of incompletely treated tuberculosis cases, who could no longer afford to continue to pay for their treatment [Banerji 1988]. Similar observations have been recorded by Mankodi and van der Veen [1985], Jadhav [1988] and Qadeer [1988].

Thus, while there has been a steep increase in the felt need and demand for medical care services within the study population, these have not been adequately catered to, either by the government health institutions or by the private sector. This situation is extremely unstable.

Summary and Conclusions

The studies on health behaviour conducted by cultural anthropologists in the fifties and sixties suffered from serious conceptual as well as methodological shortcomings. They considered health behaviour of rural populations in isolation. A similar approach was adopted in presenting and analysing the cultural meaning and cultural perception of health problems by villagers. Methodologically, the approach to data collection suffered from profound ethnocentric bias. The efforts to develop an integrated methodological approach to study health behaviour was also not adequate. These studies created conditions under which the victims were blamed for their predicament.

An alternative conceptual framework, which underlined close interaction of health behaviour with cultural perception and meaning and access to health services has been developed to make a more objective study of health behaviour among rural population in India. This cultural complex becomes an integral part of overall culture

of the population. It is also subjected to cultural diffusion and purposive intervention from outside. The concept of felt need among people for alleviation of suffering caused by various health problems is an outcome of adoption of this alternative approach.

A methodological perspective has been developed to use the alternative approach to carry out social science studies for formulating India's national tuberculosis programme. Following this series of studies, a much wider supply of health behaviour in nineteen villages in eight states was initiated in 1972. These villages were followed up repeatedly, with the last visit taking place in 1987-88. The study of the villages over a span of about fifteen years provided a range of information concerning rural social, cultural and economic transformation and change of health behaviour. It was observed that there is a close correlation between the two and change of health behaviour can be considered as one of the indices of the degree of rural transformation.

Growth in Manufacturing Output since 1980

Some Preliminary Findings

R Nagaraj

This note describes trends in the growth of gross value added in the manufacturing sector using mainly National Accounts Statistics, 1989 *and reports findings of a comparison of the observed trends in the eighties with the experience of the previous three decades. The results of this statistical exercise appear to be significant in the context of the doubts expressed on the validity of the revised index of industrial production (with 1980-81 as the base year) and the continuing debate on the persistence of a 'relative stagnation' or 'deceleration' since the mid-sixties.*

TRENDS in the growth of the manufacturing sector in India have been a much debated issue for quite sometime now. Ahluwalia's statistical exercise conclusively demonstrated the relatively slower growth of the registered manufacturing net value added at constant prices between 1966-67 and 1979-80 as compared to the earlier seven-year period of 1959-60 to 1965-66 [Ahluwalia, 1985]. She added that "there was no difference in results whether the period analysed is up to 1979-80 or includes the first two years of the eighties to end in 1981-82, implying continuation of the "relative stagnation".

Before her decisive statistical account was published, Raj's graphical analysis of smoothened time series of *total* manufacturing gross value added for the period 1952-53 to 1982-83 questioned the persistence of the relative stagnation or deceleration [Raj, 1984]. He "advanced the view that even though one cannot yet firmly support it with adequate statistical evidence (in fact not perhaps for another decade till sufficiently long time series is available), there has been possibly some increase in the rate of growth of industrial output since the middle of the 1970s raising it closer to the levels achieved in the 1950s and 1960s [Raj, 1984, p 1802].

Drawing a different periodisation on the basis of a certain understanding of policy regimes, Alagh [1985] arrived at a similar conclusion: "Even ignoring the unregistered manufacturing sector, industrial output in India grew at a rate of 7.6 per cent per annum for the period 1976-77 onwards compared to 4.6 per cent per annum in the period 1971-76. . ."

Arguing that the improved industrial performance (secured as a result of the policy initiatives since 1980) is not getting fully reflected in the index of industrial production [IIP][1] *Economic Survey, 1985-86* provided data to support its view (Table 1). It showed that during 1974-75 to 1982-83, the output growth in real terms was 8.0 per cent per annum according to *Annual Survey of Industries* [ASI], whereas IIP recorded a growth rate of only 4.4 per cent.[2]

To overcome the shortcomings of the IIP (with 1970-71 as base year), a revised (or new) index with 1980-81 as the base year was introduced. The revised index, showing a distinctly higher growth rate in the eighties, is widely criticised for the alleged overestimation of output due to arbitrary replacement of supposedly slow growing industries with faster growing ones [Chandrasekhar, 1988, and Kurian, 1989]. However, despite the skepticism over the validity of the new IIP, there now appears to be a cautious admission of a moderate improvement, though it is not strong enough to change the long term trend of relative stagnation in industrial output observed since the mid-sixties: "the most recent trend rate is still well short of the expansion seen in the first decade and a half after the launch of planned development"[Chandrasekhar, 1988, p 2359].

In this context, especially as serious doubts have been expressed on the accuracy of the revised IIP, there appears to be a need to assess the trends in the eighties with possibly more reliable and recent data. A modest attempt at such an exercise is now possible with the availability of *National Accounts Statistics (NAS), 1989.* This note describes trends in the manufacturing sector in the eighties and compares them with the performance in the earlier periods. Though our exercise has a limited purpose of reporting the findings which seem to merit attention, the observed changes in the eighties could have implications for the long term trends in industrial output.

I

NAS 1989, the second issue with new series with 1980-81 as base year, provides data on gross value added at constant prices separately for both registered and unregistered manufacturing disaggregated at two digit National Industrial Classification (NIC). Estimates on registered manufacturing, like in the earlier series, is based on *ASI* data though with a changed base year. Estimates for the unregistered manufacturing have been revised on the basis of production of cloth in the decentralised sector and changes in the bench-mark estimates using NSSO data [CSO, 1988]. Considering that the estimation procedures have remained by and large the same the revised series can perhaps be taken to be reasonably satisfactory for analysing broad trends in the manufacturing sector.[3]

Taking these remarks into consideration we find a significant difference in the estimates of gross value added in the new series. The share of unregistered segment in the total manufacturing which came down from 48 per cent in 1953 to 37 per cent in 1979-80 (according to the 1970-71 series) increased to 43 per cent in 1980-81 in the revised series. However, it has declined since then (Figure 1).

A comparison of the share of unregistered manufacturing to the total at 1970-71 prices and 1980-81 prices for the year 1980-81 shows (Table 2) that the upward revision in the new series is mainly on account of industry groups beverages and tobacco (22)[4] and textiles (23-26). Decline in the share of unregistered manufacturing is discernible in industry groups food (20-21), paper and printing (28), leather and fur (29), rubber and petroleum (30), non-metallic minerals (32), transport equipment (37) and others (38).

Table 3 provides trend compound growth rate [5] and annual average growth rate for total, registered and unregistered manufacturing. The results show that during 1980-81 to 1986-87 total (registered plus unregistered) manufacturing gross value added at constant prices grew at 8.3 per cent per annum. While the registered segment of manufacturing recorded a growth rate of 10.4 per cent per annum the unregistered segment increased at 5.3 per cent per annum. A similar trend is noticeable according to the measure of annual average rate also.

Total manufacturing gross value added grew at a faster rate than average growth rate in industry groups rubber and petroleum (30), chemicals (31), non-metallic minerals

TABLE 1: INDICES OF INDUSTRIAL PRODUCTION (Base: 1973-74=100)

Year	Based on Index of Industrial Production	Based on Annual Survey of Industries
1974-75	101.8	105.0
1975-76	106.6	115.8
1976-77	117.4	127.6
1977-78	122.8	140.6
1978-79	132.1	156.5
1979-80	128.8	156.9
1980-81	133.6	159.0
1981-82	143.6	176.1
1982-83	147.1	199.1
Growth Rate	4.4	8.0

(32), non-electrical machinery (35), electrical machinery (36), others (38) and repair services (39).[7] Beverages and tobacco (22) recorded the lowest positive growth while wood and furniture (27) experienced a negative growth. Unregistered manufacturing grew at a lower rate than the registered in all industry groups excepting in textiles (23-26). Comparison between the growth rates according to *NAS 1989* and the revised IIP for manufacturing shows that the output increase by the latter measure is not only lower (6.7 per cent per annum) than that of the registered manufacturing (at 10.4 per cent per annum) but also of the total manufacturing (at 8.3 per cent per annum). This appears to be significant in the context of the serious doubts expressed over the ac-

FIGURE 1: SHARE OF UNREGISTERED MANUFACTURING
(Year: 1950-51 to 1986-87)

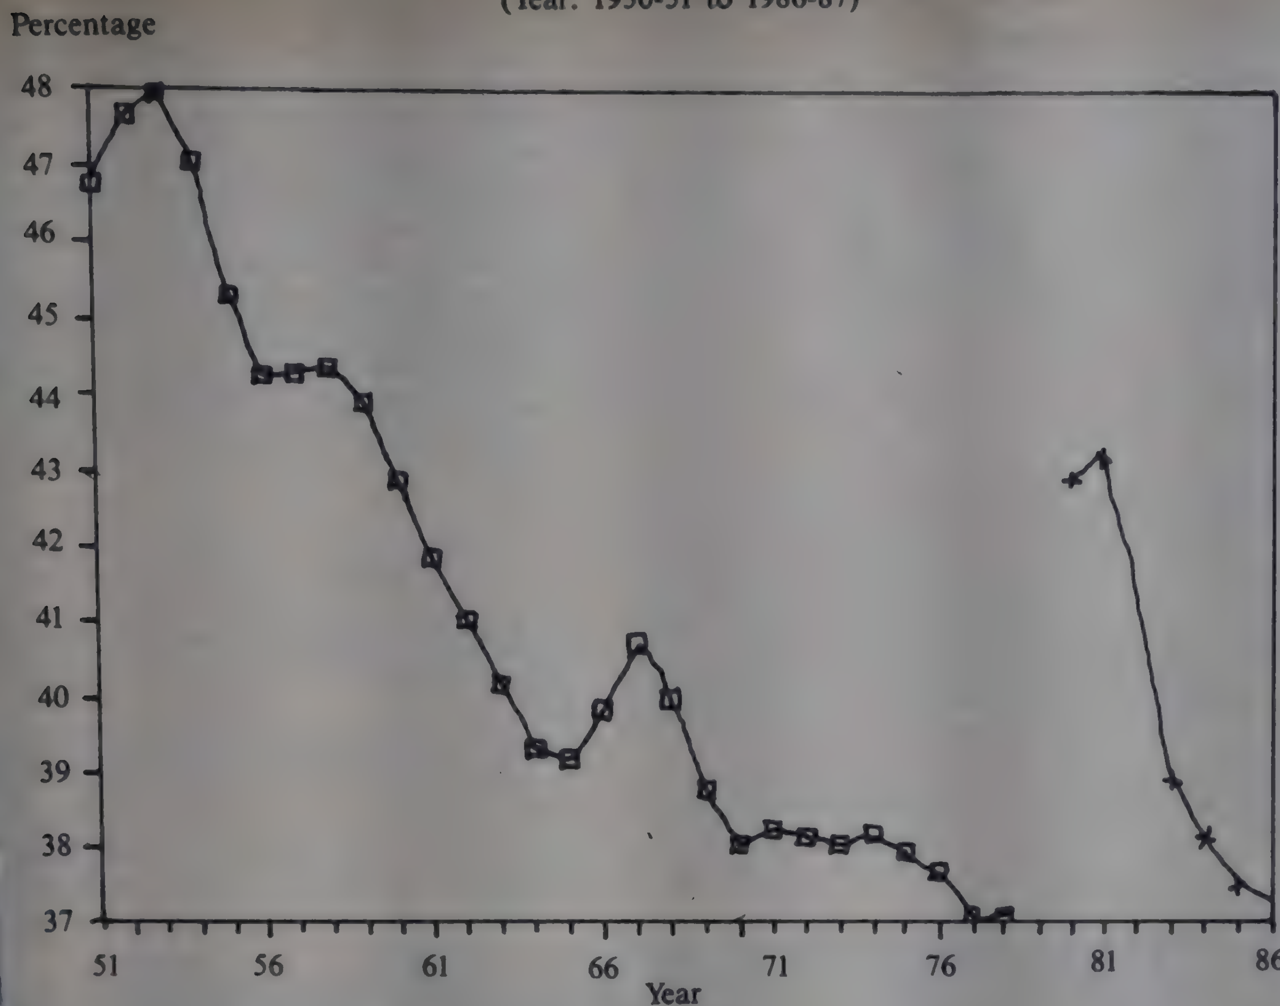

FIGURE 2: TRENDS IN MANUFACTURING OUTPUT
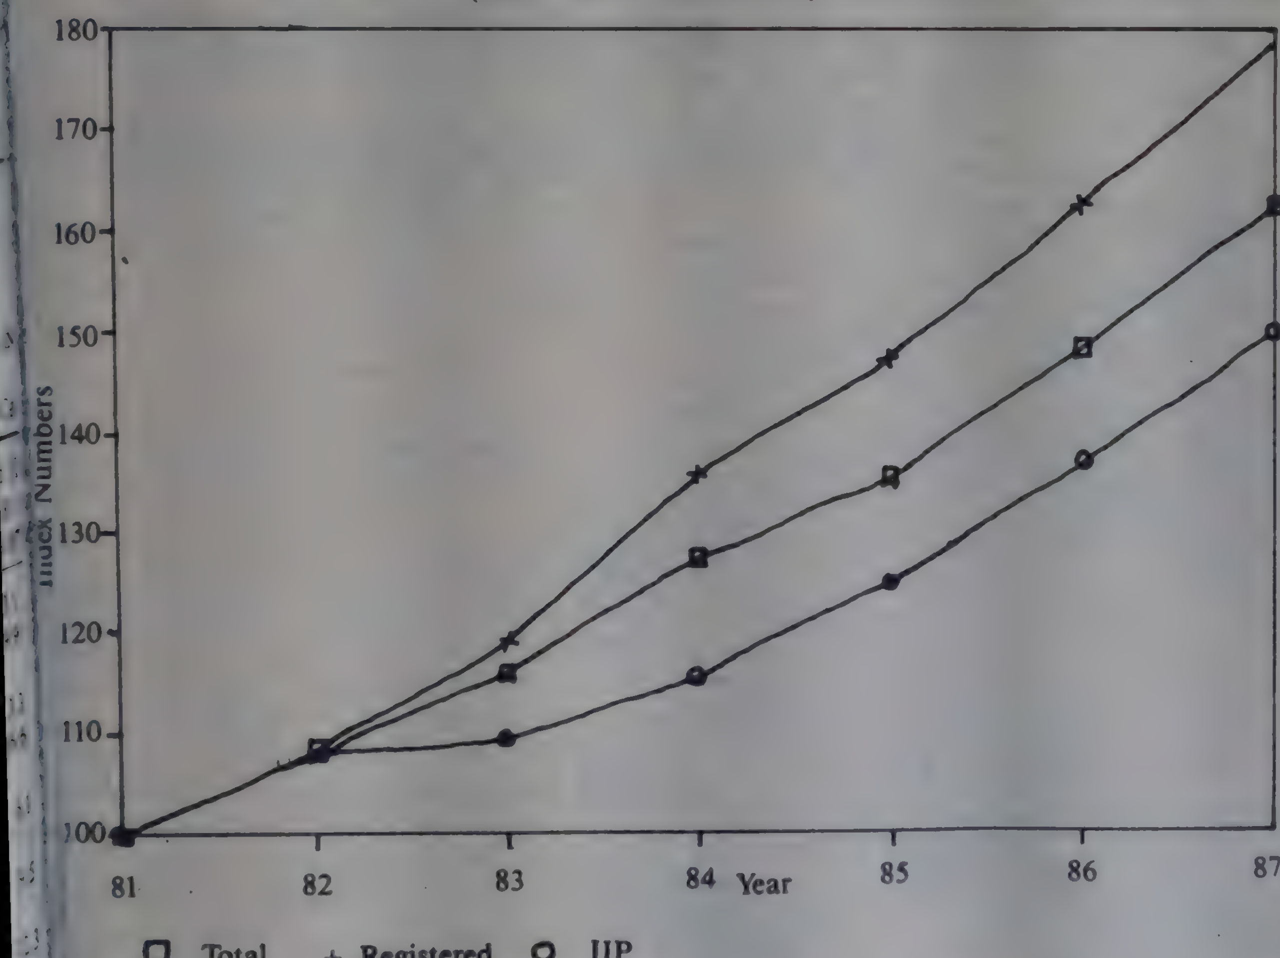
(Year: 1980-81 to 1986-87)



curacy of the revised IIP. As the observed higher growth rate according to *NAS* compared to IIP is similar to the pattern observed for the earlier periods by Ahluwalia, the arguments of overestimation of output by IIP do not appear to be tenable. If we accept that the trends depicted by the IIP is broadly correct, though on a conservative side (Figure 2), then it may not be inappropriate to utilise the IIP to discern some patterns in the observed growth in the eighties.

Use based classification of the revised IIP for the period 1980-81 to 1986-87 shows that consumer durables accounting for 2.55 per cent of manufacturing grew the fastest at 14.7 per cent annum[8] followed by capital goods (weightage 16.4) at 10 per cent per annum (Table 4).

II

Having described the growth of manufacturing sector in the eighties in a few limited dimensions, we compare them with the record of the earlier periods though such an attempt has a number of limitations. First, comparison of results based on a short time period of seven years with long term trends could yield misleading results. Secondly, as the data for different time periods are based on different base years a strict comparison is not possible. Thirdly, as there have been changes in the industrial classification a rigorous comparison would require more disaggregated data. Considering these limitations our exercise could at best be taken as an indication of the broad changes. To accommodate for the statistical problems mentioned above, variation in growth rate in different periods up to two percentage points are not taken into account.[9]

Our preliminary attempt could perhaps be justified, despite being fully aware of the shortcomings since it appears to us to be important to have such a comparative empirical basis to assess the changes in the policy regime in the eighties.

Table 5 provides growth rates in value added[10] in registered manufacturing for three time periods, namely, 1959-60 to 1965-66 (period I), 1966-67 to 1979-80 (period II), and 1980-81 to 1986-87 (period III).[11] Growth rate in registered manufacturing in period III at 10.4 per cent per annum is not only higher than that attained in period II (at 5.5 per cent) but also that in period I (at 7.6 per cent). Growth rate at the disaggregated level in period II is lower than that in period III (after applying a discount of two percentage points) in all industry groups except textiles (23-26), wood and furniture (27) and basic metals (33). A similar comparison between period I and period III shows that the following industry groups constituting about two-fifths of the value added (in 1986-87) experienced a higher growth rate in the latter period as compared to the former: food products (20-21), leather products (29), rubber and petroleum (30), non metallic mineral products (32), electrical machinery (36) and miscellaneous (38).

The above findings indicate that the observed expansion of registered manufacturing output in the first seven years in the eighties appear to be comparable, if not bet-

ter, than the achievement in the seven year period preceding the mid-sixties, a period is widely accepted as a phase of high growth.

To sum up: In the context of the continued debate on the relative stagnation of the manufacturing sector since the mid-sixties we considered it meaningful to examine the trends in this sector in the eighties. As the official view of an upturn in the growth rate based on the revised index of industrial production has been questioned we considered it appropriate to examine the issue using the data provided in the *National Accounts Statistics, 1989.* Our findings show that while the total manufacturing gross value added grew at over eight per cent per annum in real terms during 1981-87, the registered manufacturing segment recorded a growth of over ten per cent per annum. According to the new series of *NAS*, the share of unregistered manufacturing has gone up, mainly on account of an upward revision of output in beverages and tobacco (22) and textile (23-26) industries. However, the rate of growth of unregistered sector has been considerably lower than that of the registered sector. In terms of used-based classification [of the revised IIP] consumer durable industries having a weightage less than three per cent witnessed fastest growth rate of over 14 per cent per annum followed by capital goods industries at 10 per cent per annum.

A careful comparison—since such an attempt has several limitations—of the experience of the eighties with those of the earlier periods for the registered manufacturing (even after discounting of growth rate of two percentage points to account for the statistical adjustments) suggests that the growth rate between 1980-81 and 1986-87 is higher than that during 1966-67 to 1978-79. It also seems to be comparable to, if not better than, the growth rate achieved during 1959-60 to 1965-66. The above pattern seems to be true for a wide range of industry groups accounting for about two-fifths of the registered manufacturing output. If our findings, based on limited data and rudimentary statistical method, are valid then the observed changes in the eighties would warrant a closer examination so as to understand their underlying causes.

Notes

[I am grateful to Sebastian Morris, G Pakki Reddy, K Das, Sunita Murthy and K Narasimha Rao for their help in writing this paper.]

1 This is said to be so on account of changes in the composition of output and the inadequate coverage of the supposedly fast growing industries in the small scale sector.

2 Discussing the limitations of IIP, Ahluwalia (1985) has clearly demonstrated the underestimation of output by the index. Since the method of collecting information has not changed the shortcomings outlined by her would seem to continue in the new series as well.

3 We are quite aware that this inference may appear somewhat hasty. As the "sources and methods" for the revised series is yet to be published, we are unable to check for the quality of the revised estimates. However, accepting the view of Dutta Roy Chaudhuri (1988) we are inclined to accept that the revised estimation of output is not significantly different from that of the earlier series.

4 Figures in brackets refer to industry group according to two-digit NIC.

5 We have fitted log linear trend function where anti log of 'b' minus one, multiplied by 100, gives annual average growth rate, Our method is identical to Ahluwalia's.

6 Annual average growth rate is simply average of annual percentage change over the period. This is same as the method used by Raj (1984). However, we have not smoothened the series due to lack of adequate number of observations.

7 Differences in growth rate up to one percentage point are not taken into account.

8 Relatively rapid growth of consumer durables has been widely commented upon as a reflection of a certain pattern of luxury goods oriented growth strategy implicit in the liberalised policy regime in the eighties [Kurian 1989, Chandrasekhar 1988]. Table A providing growth rates of industrial output according to use-based classification shows that since 1951 growth of consumer durables has been consistently higher than that of the non-durables. Without questioning the commodity composition of the consumer durables category, if the ratio of growth rate of durables to non-durables is taken as a measure of the 'luxury goods orientedness' of industrial output then this was highest 6.7 during 1955-60 as compared to 1980-87 when it was 2.6. Moreover, the weight of consumer durables in successive IIPs has steadily come down from 5.68 per cent in 1960-61 to 2.55 per cent in 1980-81 (see Table A).

9 This, admittedly, is arbitrary. We have no *a priori* reason for using any specific discount factor.

10 Growth rate estimates for periods I and II from Ahluwalia [1985 p 30-31] are for *net* value added while our estimates for the eighties and for *gross* value added. Since we are concerned about growth rates and not about absolute value the discrepancy is unlikely to make any difference.

11 Ahluwalia's study completely ignored the unregistered manufacturing which, though declining, was not insignificant at a little over two-fifths of the total manufacturing output in 1980- 81, according to the new series.

'Science' in the Service of Monopolies

The ubiquitous common salt which once was the symbol of our struggle for national liberation will soon be no more. It will be replaced by a higher priced, fine, iodised salt in sleek bags and carrying brand names made familiar by the electronic and other media. The change-over will be enforced by legislation enacted by the government, buttressed by arguments put forth by a 'neutral, disinterested' scientific establishment. The monopoly sector of Indian industry will chip in its might guided of course by the 'noble' pursuit of profit. And all this is being done in the name of the poor, suffering millions. 1543

In Search of Identity

More than four decades after its creation, Pakistan is still a country in search of an identity. Not that the people of Pakistan have not been preoccupied with the issue of nationhood; on the contrary, it is the one issue they have been obsessed with. Political debate and conflict have revolved around the question: What is the legitimate place of sub-national aspirations and demands within the larger concept of Pakistani nationhood? 1527

Over-Taxed?

Is the exemption limit for personal income tax high or low in India as compared to that in other countries? A study of the relationship between personal income tax exemption limit and per capita income in 26 countries. 1535

Tribal Politics

A new insurgent group, the Tribal National Liberation Front, has surfaced in Tripura barely 10 months after the surrender of the TNV extremists. Is this new insurgent group a creation of the Congress(I)-led coalition government in the state to create conditions for using the armed forces to weed out the CPI(M) from the tribal-dominated areas of Tripura? 1501

Land has been closely associated historically with the political struggle in Jharkhand and this connection has continued up to the present day. The building of an agrarian movement is therefore essential for strengthening the current phase of the Jharkhand movement. 1505

No Mystery

In March-April this year over 200 tribals died in the tribal districts of Bihar of what the government described as a 'mystery disease'. However, to those familiar with the tribal areas of Bihar and with the conditions in which the tribals live, the outbreak of the epidemic was hardly a surprise nor its cause a mystery. 1503

Revolutions: Made and Unmade

Bastille gave acceptability to the concept of the revolution. Revolutions, the point was established, are not outside the human system. Once this is accepted Bastille falls into place: without it there would be no storming of the winter palace, no Long March nor the magic of Dien Bien Phu or Sierra Maestra. 1499

The ultimate tragedy in the events of June 4 and thereafter in China may be to preserve the notion—comfortable to those currently in power—that economic progress without political reform is possible. 1511

The democracy movement or counter-revolutionary rebellion in China—whatever name one may choose to describe it—lends a new perspective to India's political development as a nation-state in the last 40-odd years. All the more so because India and China launched their respective careers as sovereign states at about the same time 1497

Long Journey

The processes by which the women workers in the so-called production-cum-training centres run by the Delhi administration are being made into refugees for the second time in their lives are but a reflection of the larger trends at work in the country's economy and polity. A report. 1507

Jute Woes

APROPOS the note 'Saviour from Dundee' (June 3) the fall of the jute industry in West Bengal has been largely due to the pro-labour, anti-farmer policy of the state as well as of the central government. The idea behind declaring jute as an essential commodity was simply to deprive farmers as and when prices were hiked by fixing maximum prices and by forcing them to sell to the government agencies or the people having storage licences at the so-called minimum prices. It was gross injustice to jute growers to declare jute an essential commodity. Again the jute industry was forced to fall sick by labour unions under protection of political bosses so that they could be taken over by the government and labour could lead a luxurious life without commitment to production. This brought a sense of fear among entrepreneurs. Naturally if one is not sure of the industry one would only syphon the gains and keep it sick so that it can be handed over as a sick child to the government. One does not repair one's house, if one knows that it shall be requisitioned by the government and that is what happened in the jute industry.

It is only recently that jute has been dropped from the list of essential commodities and the central government is showing less enthusiasm in taking over units. So new entrepreneurs are coming forward and closed jute mills have started opening. While the protection provided to the industry under Jute Packaging Materials (Compulsory Usage) Act, 1987 cannot be taken as permanent it should be used to strengthen the industry's position.

Advisers to the industry feel that the 72 jute mills cannot carry the burden of 2.4 lakh workers and so they should be retrenched. But then retrenchment of the labour cannot be acceptable to the country, when millions of people are awaiting employment. Again retrenchment is ony possible by automation, which again will need huge funds which the ailing industry would not be able to bear if it fails to divert its production to jute-based products like carpets, carpet-backing, furnishing fabrics, jute felt, paper making, laminated boards for packing fruits, tea, etc. Efforts should also be made to install new import substitute plants so that while these new products absorb the extra labour they also make more profit to help the survival of the mother unit.

Effort is also needed to make the raw jute cheaper so that jute products can compete with modern packaging material in the market. The major cost input in raw jute is of fertiliser. Chemical fertilisers are being propagated as boon to the farmers but in reality, this is not so. For example, while fertiliser consumption has increased by more than seven times food production has only doubled. Again compost fertiliser is very cheap but since the population of animals has fallen it is now scarce, and more so in the states where cattle slaughtering is permitted.

The central government should come forward and offer higher cash incentives to agro-based jute industry to help the farmers so that surplus jute production can be exported. Again the fact remains that the western world has realised that jute packing for foodgrains from human health point of view is better than the polythene. A little publicity on the advantages of jute bags should help increase our exports. Jute goods should be exempted from sales tax so that farmers find it cheaper and prefer to use new bags instead of old bags. Again jute mills should also arrange to buy old bags for reprocessing which shall help the consumer in reducing his purchase cost.

We do not need either foreign funds to promote industry or foreign expertise or entrepreneurs. We simply need to feel proud of our Bharat and its culture, and the development of our villages. Once this is done, we can always create an industrial empire.

Tricky Issues

YOUR editorial 'The Imports Trap' (May 13) raises very tricky issues, though not for the first time. The dichotomy of approaches to the compilation of exim data by the DGCI and S and RBI, has created several problems regarding the analysis of such data and the adoption of suitable and sensitive policy measures. The point at issue is not who is correct but how promptly does one get which brand of data.

There is no doubt, as it has been officially explained, that the data furnished by RBI are partial and include foreign exchange transactions both related to early and later periods, and even such data are made available only one year after the transactions have taken place. A spate of explanations and arguments ensued on your pointer, while both *Economic Weekly* and *Economic and Political Weekly* raised similar questions almost three decades back.

Such problems are not only related to the exim data but also those on company finance. While the credibility of the analysis of the RBI has gained over time, the problem of misclassification has also gathered momentum, apart from the fact that data made available by the RBI have invariably a lag of one, two, or even mor years. Since large-scale computerisatio has been attempted in both governmen and government-related agencies, it is hig time that vital information on the perfor mance of the economy was made availabl immediately after the year ended.

In the meantime, whenever there is shortfall on targets, the governmer drums up many explanations. At time in the absence of accurate informatio even the government does not kno whether a shortfall has actually tak place or not and if so, by how much. Th is a pity. On the other hand, as it h happened with exports, the twenty-ni per cent increase in exports has receiv a lot more publicity than a similar, if n a higher, rate of rise in imports.

ECONOMIC AND POLITICAL WEEKLY

Women's Health

THE fog surrounding the picture of women's health is beginning to disperse, but ever so slowly. For centuries medicine and the health establishment have viewed women only as mothers or mothers-to-be; women's illnesses have been recognised only when they have affected their reproductive capabilities. So much so that it has been assumed that women are just as ill or just as well as men except, that is, for their reproductive functions. Such an impression firstly ignores the fact that women's social status determines women's health status. Secondly, the nature of health care provided to women is determined by these assumptions, that is, it is geared towards offering special services only for conditions surrounding maternity or its prevention. This in turn has the effect of making visible only those conditions which the health establishment is geared to recognise and treat—conditions which, incidentally, are the ones sanctioned and accepted in society as ill health events.

The findings of two recent studies incorporating critical and feminist perspectives have considerably shaken this complacence about women's health. They have also posed uncomfortable questions about the unbiased nature of medical science and its practice and about the very political nature of women's health status. And ironically they show that the medical establishment has grossly underestimated the extent of even that aspect of women's health which it professes to be concerned about, viz, reproductive health.

A population-based study of gynaecological and sexual diseases in rural women in Gadchiroli district of Maharashtra is an eye-opener in more ways than one. To begin with it is the first such study in developing countries, which means that until now health planners and medical practitioners have been in a sense working blind. The study by Rani Bang and others (reported in *The Lancet* of January 14, 1989) shows that 92 per cent of all women surveyed were found to have one or more gynaecological or sexual diseases and on an average each woman was suffering from 3.6 separate complaints. About half the burden of illness comprised infections such as pelvic inflammatory disease, vaginitis, cervicitis, etc. Another major group was menstrual disorders which may well have been due to genital tract infection. And yet only eight per cent of the women had ever had a gynaecological examination.

What this means in lay terms is that more than fifty per cent of the women are suffering from illnesses which they have learned to ignore not because these do not cause discomfort but because of various social factors. It must be pointed out here that these are not self-limiting conditions which will right themselves with time. They merely get worse and ultimately severely affect women's health. A society with dominant patriarchal values does not sanction these conditions as illnesses unless they become severe enough to affect the reproductive capabilities. And even if women did wish to get these conditions cured, they have little or no access to a modern health care system. Health workers and nurses are not trained to deal with gynaecological diseases, and women doctors are conspicuous by their absence in rural areas. This means that but for surveys like this the health system is not even aware of the extent of such illnesses. This can have serious implications for women's health care. For instance, this baseline burden of gynaecological illness may give rise to or aggravate problems caused by birth control methods such as IUDs. If this is indeed so, then at least a proportion of the women may be missing out on an efficient and comparatively safe birth control method because of the neglect of women's health condition.

Another interesting aspect of the study reveals how many illnesses are not reported because women have internalised these—as being a consequence of 'being a woman'. One such condition is pain during menstruation which may be a symptom of serious problems and yet is rarely perceived as being an abnormal condition which should be reported.

It is this aspect that the study by Veena Shatrugna and others for the National Commission on Self Employed Women's Task Force on Health draws attention to in examining backpain in women. This condition, so common among women, only figures in medical complaints in association with other major symptoms or when it is severe enough to interfere with women's work. Significantly here again is one condition which is so greatly influenced by the work which is assigned to women and the kind of postures they are forced to adopt because society demands it. The study looks at women admitted to hospitals for fractures and finds that a condition like osteoporosis which has been labelled a physiological condition (caused by chronic calcium deficiency) associated with the onset of old age is in fact influenced by the social location of women.

In short not only is health status determined by social location, but its visible contours are dictated by social norms and assumptions. In patriarchal class society any attempt to improve the health status of women has not only to contend with the depressed status of women in society, but must question the very definitions of women's illness prevalent in society and reflected and reinforced by medical science. A primary and urgent task is to assess women's health status from a feminist perspective which in the first place questions existing medical definitions, assumptions and health statistics.

DEFENCE

The US Connection

THE government of India's official press release on the eve of defence minister K C Pant's visit to the US towards the end of last month stated, with deliberate intent to mislead, that the minister would have "wide-ranging discussions with the US administration on global and regional security issues". Actually the purpose of Pant's visit was very, very precise and specific: to discuss purchases of arms and defence technology from the US.

The US, it is well known, has been determinedly pursuing the objective of securing for itself a bigger share of India's large and rapidly growing arms purchases abroad. Thus the Indian defence minister's trip was by way of returning not one but two visits to this country by US secretaries of defence—those of Caspar Weinberger in 1986 and Frank Carlucci in 1988. This is not the sort of asymmetry that one ordinarily encounters in relations between the world's leading superpower and a third world country.

No wonder the red carpet was rolled out for the Indian defence minister in Washington. He rated an audience with the US vice-president, but what seems to have impressed him the most is that he was taken round some top secret US military establishments which, as he put it, even the very senior military officers accompanying him were visiting for the first time. Pant's hosts in the Pentagon evidently decided also not to give cause for any diversion of attention from the main purpose of the Indian defence minister's presence in the US by unnecessarily bringing up issues on which the perceptions of the Indian and US governments are at variance. Thus references to the Indian nuclear programme, the testing of the Agni missile and the future of the IPKF in Sri Lanka were perfunctory, if they were made at all. On the contrary, the Indian defence minister was assured that the US was convinced that India's role was leading to the stabilisation of the south Asian region and that the US was appreciative of India's role in helping its neighbours in overcoming their problems.

The Indian government still plays coy about its defence contacts with the US, the two visits to this country by US secretaries of defence and the quite frequent exchange of defence delegations in recent years notwithstanding. The defence minister was therefore at pains to point out that he had not gone to the US with a shopping list. The Indian government's public position has been that what it is interested in really is sophisticated US defence and defence-related technology which is essential for the Indian defence forces' modernisation programme. Some of the specific items which, according to newspaper reports, figured in the defence minister's discussions in Washington do, it is true, fall in this category—for example, some systems and materials for our light combat aircraft programme or certain areas of underwater warfare technology. All the same some important issues do arise.

There is, first of all, the likely impact of taking recourse to US technology on the development of Indian technology, including on efforts already under way in that direction. In the specific instance of the light combat aircraft, serious apprehensions have been voiced about the consequences of the continuous expansion of the scope afforded for imported technology in this project, which process has evidently been now given a strong fillip by Pant's US visit.

Secondly, the US government's determined initiatives to develop and strengthen relations with India in the area of defence cannot obviously have been motivated, solely or primarily, by the objective of making available sophisticated defence technology to India to speed India's military modernisation along. What the Americans are interested in, clearly, is a larger share of India's defence imports and so whatever advanced military technology India is able to get from the US will be conditional upon our significantly stepping up military purchases from the US. Whether or not the Indian defence minister went to Washington with a shopping list, very soon India is certain to be shopping for arms in the US in a big way. The implications of this for the size of our overall military spending and for the annual foreign exchange drain on account of military imports, already nearing alarming proportions, deserve close attention.

Finally, the US has also made it clear that the sophisticated technologies which India is seeking from the US can be made available to it only if there is close contact and exchanges on a continuing basis between the defence establishments of the two countries. The Indian defence minister himself has confirmed that in this regard the US went so far as to suggest joint exercises by the US and Indian navies. While Pant said he had ruled out such exercises "for the time being", it is clear that the door has been unbolted for US involvement in Indian defence matters and the bait of advanced defence technology is undoubtedly going to be used to push it open wider.

ANDHRA PRADESH

Another Charade

ALL signs point to the enactment of yet another charade in Andhra Pradesh, with the fanfare and publicity accompanying official announcements of the surrender of Naxalites being quite in keeping with the cinematic tastes of N T Rama Rao. Whether the surrenders represent an end to the twentyone-year old war between the police and the Naxalites in the state is a question that merits close scrutiny.

Upto now the number of surrenders in response to the chief minister's ultimatum and inducements has been in the region of 70 to 80 at the most. This may not significantly affect the current operational strength of the Naxalite groups since many of those who have 'surrendered' were anyway in police custody. Likewise, the much touted blow to the People's War Group, due to the surrender of M Subbareddy, a top party functionary, may turn out to be more imaginary than real, if reports of his differences with the party leadership are to be believed. If true, his decision to surrender, rather than form a splinter group, is perhaps indicative of his isolation within the party. Consequently, the developments of the past month need not be expected to drastically reduce the scale of Naxalite activities.

On the contrary, there has been a resurgence of activism among the Naxalites, for fear that the surrenders may be used as a means to demoralise the ranks. Consequently, scepticism regarding the efficacy of the state government's latest tactic will not be unjustified, for it is difficult to envisage the dismantling of a movement with reasonable grassroots support through the mere offer of monetary and other incentives to underground activists. The politics of ideology is substantially different from the politics of legislative horse-trading and populist electioneering.

The inability of successive governments to deal effectively with the situation is a reflection of the persistent tendency to treat critical socio-economic anomalies as mere crises of law and order. The centre's response is informed by the political opportunism that is characteristic of the Congress(I). While the prime minister is vociferous in denouncing the law and order problems in Andhra Pradesh, the home minister professes inability to respond to the state's demand for arms and security personnel. On the other hand, the state government's handling of the situation is an exercise in inept politics. Keeping one eye trained on the electorate, it seeks to assuage public outrage against the blood-letting, while the other eye is solicitous of the landlords' interests. Sta

government proposals to deal with the Naxalites have been varied and palpably contradictory, for these include the liberalisation of fire arms licensing to enable the arming of villagers, the establishing of an elite Greyhound force to annihilate them and the offer of incentives, the last-named being instrumental in enabling it to preside benignly over 'surrender melas'.

The inability to tackle the essential socio-economic core of the problem in the seven districts of northern Telengana and north-east coastal Andhra Pradesh is not surprising. A case in point is the attempt to amend Regulation One of 1970, by engineering a majority in the Tribal Advisory Council. The amendment will remove the existing restriction on free sale of land by non-tribal landowners to non-tribals in the Integrated Tribal Development Agency areas and will have obvious adverse implications for the tribals. The move will legitimise illegal holdings of non-tribal landlords, among whom are senior Telugu Desam party functionaries. Being a government move it can only deepen support for the Andhra Pradesh Naxalites in their traditional strongholds.

The state government's efforts to provide the tribals with jowar at Rs 1.25 per kg is not likely to have much of an impact since the Naxalites distribute it free. On the other hand, the solution of violent repression seems to be running into serious difficulties since state-instituted violence has begun to invite Naxalite wrath on district-level Telugu Desam Party functionaries, who have begun to articulate their discontent openly after the recent killing of Malhar Rao, the Tadicherla mandal president.

INDO-PAK RELATIONS

India Must Respond

THE Pakistani prime minister Benazir Bhutto's recent plea in her interview with a Saudi English daily for India-Pakistani talks on the question of mutual arms control deserves a warm and positive response from this country. She has rightly pleaded that the two countries should discuss the arms issue themselves, instead of expressing concern every now and then. "Whatever India buys," said she, "gives a cause for concern in Pakistan and whatever we buy causes concern to India." She has further said that Pakistan did not want to upset the arms balance in this region and that whatever had been discussed or negotiated with the US administration during her recent visit to Washington had been in accord with the military balance of three-is-to-one.

Benazir's pronouncements have earned a measure of credibility through her actions as well as inactions. By dismissing the late Pakistani president Zia-ul-Haq's nominee, Lt-Gen Gul, from the top of the all powerful SIS, reportedly because of his refusal to stop meddling in India's internal affairs, she has shown her concern for a new relationship with this country. Similarly, by refraining from an active promotion of the aggressive activities of the Mujahid forces based in Pakistan against the Najibullah regime in Kabul, she has also notified her disassociation from the adventurist policies of the Pakistani military bosses in that area.

It is indeed high time that India responded to the new Pakistani overtures. Even more urgent, however, is India's deceleration of its own militarisation before the more bellicose elements in Pakistan make use of this country's arms purchases to get Benazir's softer approaches reversed. It should not be overlooked that India is not only acquiring the image of a regional bully on the international scene, what with its present postures in Sri Lanka and Nepal, it is also seen both inside the country and outside to be the possessor of the requisite muscle powers for this role. Some Indians have been taking pride in the country's role as 'an emerging superpower', while foreign observers, even if they are guilty in some cases of a measure of deliberate exaggeration, also draw the same conclusion as was recently done by the US journal, *Defence and Foreign Affairs*.

The 'proud' Indians should not forget that a bully in the international arena can grow into that role only by assuming the same role—indeed in a more vicious form—within the country. Hence, it is more in the interest of Indian democracy and equity that New Delhi be persuaded to respond to Islamabad's new signals—immediately, warmly and positively.

CHRISTIAN DALITS

Worsening Discrimination

THE recently held National Convention of Catholics in Bombay assumes importance in the context of the stirrings among the Christian Dalits who form about 80 per cent of the Christian population of the country. For nearly 40 years now they have been fighting for recognition as scheduled castes and for the statutory benefits that go with it, which are denied under the Presidential Order of 1950. Christian converts from the scheduled castes and tribes are not considered to be under the scheduled category any longer under the order. The assumption behind this is that once converted to Christianity, within the fold of the church the scheduled castes and tribes no longer face any economic or social discrimination to deserve special protection from the state.

This is however far from the truth. Despite talk of universalism of the Christian religion, the Chirstian clergy from the upper-caste background who dominate the churches practise the most atrocious forms of discrimination against the Christian Dalits. Separate places in pews, separate hearse and burial grounds, less than five per cent inter-caste marriages, segregated churches, caste titles in name boards and in church and secular documents are some of the most blatant forms of discrimination.

The casteism of the priests is sanctified by the courts also. Some years ago when the Christian Dalits demolished a wall that was set up by the Vellala Christians in Tiruchi to separate the burial grounds of the caste Christians from those of the Christian Dalits, the dominant Vellala Christians went to the court and got a verdict in their favour forcing the Dalits to pay a fine. Of late, the Christian clergy are even resorting to violence to keep the Dalits in their place. Among the Catholic fishing folks in Marianad and neighbouring villages in Kerala (where the Trivandrum Social Service Society started the famous community development project for the fishing community), tensions have developed between the better-off fishermen and the poor Dalits. The former backed by St Andrews parish priests launched an attack on the Christian Dalit fishermen of Fathimapuram last December, forcing the latter to go on a hunger strike in front of the house of the Trivandrum Bishop, who is the appointing authority of the priests of St Andrews parish.

As the Christian Dalits are becoming more assertive about their rights—both as Christians within the community, and as a part of the exploited poor outside, which make them join the struggles of the agricultural workers or fishermen under the banner of secular organisations—the Catholic priests feeling threatened by the challenge to their traditionl power are retreating to a fundamentalist position. A Pastoral Letter by 26 Catholic bishops of Kerala expresses fear that the church is losing youth to Marxism, and attributes the phenomenon to lack of adequate teaching against atheism within the community! These bishops are now trying to purge their dioceses of priests who (inspired by the 'liberation theology' in which Marxian analysis is an important component) have been involved in, and often have been leading, people's struggles. In Kerala, these priests in different dioceses are being served notices by the bishops asking them not to exercise their priestly ministry.

These developments within the Catholic church in the country bear an eerie resemblance to a common current in other minority religious institutions—the tendency, often taking a violent form, to suppress any attempts at reform, or expressions of dissidence that challenge the dominant priestly class. The orthodox and powerful Catholic bishopric is perhaps waiting to throw up a counterpart of the Syedna, or Imam Bukhari or Bhindranwale. Let us not minimise the potentialities of mischief-making. It was an alliance of the fundamentalist Catholics and the orthodox Nairs which frustrated the reform attempts, and brought down the first communist ministry in Kerala in 1959. The centre—on the plea of non-interference in the internal affairs of religious institutions—acquiesces in a process which helps the reinforcement of religious obscurantism, found to be a ready ally by the unscrupulous landed gentry in the countryside, to torpedo social reforms within the communities, to suppress struggles for economic reforms by dividing the rural poor on religious and casteist lines, and to sustain the *status quo* that allows the co-existence of a Green Revolution with religious fundamentalism.

ANGOLA

First Step to Peace?

THE 14-year old civil war between the MPLA and UNITA forces in Angola seems to be drawing to a close. The announcement of a ceasefire between the forces of Angola's MPLA government and the UNITA rebels on June 22 perhaps marks the beginning of the end of the protracted conflict. On that day, the Angolan president Jose Eduardo dos Santos and the UNITA leader Jonas Savimbi shook hands at the summit of 18 African leaders in the northern Zairian city of Gbadolite and agreed to work for a political solution to the conflict.

Hopes for a negotiated settlement of Angola's civil war came on the horizon in July last year when Angola, Cuba and South Africa agreed on a phased withdrawal of Cuban troops from Angola and South African troops from Namibia. This was followed by the declaration of a ceasefire between the three in August. In December they agreed on the date (April this year) for the start of the Namibian peace plan and mid-1991 as the final date for the Cuban withdrawal. In May this year Angola proposed a peace plan to eight African leaders at the Luanda summit that fuelled the present local African initiative.

The 14-year old civil war has been buttressed by the superpowers, the Soviets and Cubans backing the MPLA government and the US and South Africa supporting the UNITA rebels. To an extent, it is Moscow's review of its strategy in southern Africa that has paved the way for a solution. But this has meant crucial compromises for the anti-imperialist and anti-racist forces. For instance, as part of the regional package, Luanda has requested the ANC to close its guerilla training bases in Angola and Sam Nujoma of SWAPO has to disallow ANC military training bases in Namibia. But another important factor making for the breakthrough in southern Africa was the shifting of the military balance against Pretoria as also the fact of the latter no longer being able to militarily intervene on behalf of UNITA.

The way is now open for an eventual national reconciliation in Angola, though it may be a long, difficult and fragile process. The Angolan president reacted cautiously to questions about the ceasefire saying that "It is a first step. But at least we are all acting in good faith." While Washington welcomed the açcord, it reiterated its military support and commitment to supply arms to UNITA.

BUSINESS

UTI

Innovative Marketing

THE Unit Trust of India could not have registered a better performance in the eventful silver jubilee year ended June 1989. It has registered further spectacular improvement over its previous year's record in every sphere of its operations. Aggregate sales of units under all the schemes increased over the year by 84 per cent from Rs 2,059 crore to Rs 3,790 crore. The Trust added 9.21 lakh new accounts taking the total to around 50 lakh. Investible resources increased by 68 per cent from Rs 6,739 crore to Rs 11,296 crore, gross income by 93 per cent from Rs 841 crore to Rs 1,625 crore and reserves and provisions by 107 per cent from Rs 941 crore to Rs 1,950 crore. Under direct financial assistance, sanctions increased by 53.7 per cent from Rs 1,264 crore to Rs 1,943 crore and disbursements by 34.3 per cent from Rs 807 crore to Rs 1,084 crore.

Consequent on the increase in distributable income and in keeping with the corporate objective of providing a reasonable and competitive rate of return to unit-holders, dividends have been further stepped up for the tenth year in succession. The dividend for the main unit scheme (US) 1964 has been raised from 16.5 per cent to 18 per cent, including a one-time silver jubilee dividend of one per cent. The dividend for Mastershares has also been stepped up to 18 per cent from 13 per cent paid in the previous year. The dividend for the unit scheme 1971 is up from 13.5 per cent to 13.75 per cent and that for the capital gains unit scheme 1983 from 9.6 per cent to 9.7 per cent. For charitable and registered societies scheme 1981 the dividend has been raised from 14.75 per cent to 15 per cent. UTI continues its impressive achievement of releasing its results on the last day of the year and despatching dividend warrants during July. This is no doubt a measure of the efficiency of its procedures and systems.

The adoption of novel and innovative methods of marketing its increasing number of schemes tailored to suit diverse needs, the strengthening and streamlining of marketing strategies and improved customer services are said to have made significant contribution to the uninterrupted growth of UTI. The increase in the number of unit-holding accounts is interpreted as indicative of the growing popularity of the schemes as well as the effectiveness of innovative marketing efforts.

In the absence of break-up figures of sales of units under different schemes as also of sales during July—the special offer period—it is difficult to make a proper appraisal of the nature of investor response

needs to be noted that despite the record 4 per cent increase in aggregate sales, new ccounts added during the year numbered .21 lakh against 11.16 lakh in the preeding year. Far more significant are the TI chief M J Pherwani's remarks in eply to queries by newsmen that only 5 per cent of the total sales are accounted or by the rural and semi-urban areas and hat out of total sales of Rs 3,790 crore under as many as 29 schemes), nearly s 2,000 crore (52.8 per cent) were ccounted for by the main unit scheme 964 and that these sales were divided lmost equally among the corporate ector, banks and individuals. In this context it would be of interest to refer to TI's last report (1987-88) to make some ertinent observations. Out of the total ales of Rs 2,059 crore under 25 different chemes the UTI operated in 1987-88, 53.8 er cent were accounted for by just two chemes—US 1964 (Rs 859 crore) and GS 1983 (Rs 248 crore). And what is nore significant, 82.9 per cent of the total ales under US 1964 were effected in July lone. This clearly shows that the inducement of the concessional price during the pecial offer period (July) has a much reater pull on sales of units than the ustained promotional campaign carried ut during the rest of the year.

It is common knowledge that both chemes—US 1964 and CGS 1983—have ery little to offer to ordinary investors elonging to the non-tax paying category y way of annual return and/or capital ppreciation. Even on the basis of purhase effected at the concessional price uring July, the annual return on US 1964 n a possible dividend of 18 per cent for 989-90 works out to less than 13.5 per ent and prospects of capital appreciation re virtually nil. Unit-holders have derived ardly any benefit from the appreciation f the Trust's assets. Investment in units most advantageous to individuals aying wealth tax and higher rates of ncome tax. Investors in Mastershares ave, of course, been very well rewarded y way of return as well as capital apeciation. But Mastershares being mutual und are conceptually different from TI's units.

Unquestionably, the concessional price ffer during July and the numerous tax xemptions that the Trust enjoys continue be the major factors contributing to the ninterrupted growth in sales of units. To nake this point is not to belittle the imortant role UTI has been playing and will ontinue to play in mobilising the savings f the people and channelising them into roductive industrial ventures. The houseold sector has of late been showing ncreasing preference for financial assets or deployment of savings. The UTI is ideally suited to exploit the potential for mobilising household savings for financing industrial growth. There will always be a class of people who would like to invest their savings in securities but are not familiar with the intricacies of operating on the stock exchange. Nor is the stockbroking community properly equipped to woo and service these prospective investors.

The UTI owes much of its rapid growth to the unique tax exemptions it enjoys. But then fiscal and tax concessions have been increasingly deployed to promote growth in several sectors of the economy—saving, investment in new ventures particularly in backward areas, exports, etc. Undoubtedly, UTI has done a commendable job in mobilising resources from the domestic market and with the setting up of the India Fund (UK), the India Growth Fund (US), the activities of the Trust have crossed the national frontiers and investors abroad are being invited to participate in the Indian capital market.

There is immense scope for tapping the vast reservoir of household savings in the rural and semi-urban areas. The Trust is aware of the need to provide appropriate instruments for garnering these savings for industrial development. It is always looking for products which have a good investor appeal and offer investment portfolio mixes ranging from conservative income-oriented funds to aggressive equity funds structured for maximum capital appreciation. Currently, the Trust is gearing itself to venture into housing and construction fund, equity-linked savings scheme and second series of venture capital fund.

The UTI has come to be recognised as a good and reliable manager of its investments with a business-like and service-oriented approach. Apart from mobilisation of savings, the most outstanding aspect of UTI's operations is the vital role it has of late been playing in developing the country's capital market—secondary as well as primary. During 1988-89 alone, UTI invested Rs 1,120 crore in equities, representing 25 per cent of the total funds invested during the year. Three years ago, at the end of 1985-86, UTI's total investment in equities was only Rs 371 crore. At the end of June 1989, its equity investment stood at Rs 2,263 crore. The Trust has emerged as one of the largest institutional investors in the capital market. Its operations in the new issue market and in the secondary market have brought about a phenomenal change in the structure of the capital market and its orderly development. The UTI chief is highly optimistic about the outlook for the equity market. And what he thinks certainly matters.

TWENTY YEARS AGO

EPW, July 5, 1969

The sudden ordinance from Delhi, banning forward trading in shares at all the stock exchanges, has pricked the stock exchange boom which had assumed abnormal proportions over the last six months... Over the last three years, initially as a result of the recession and, more recently, owing to the prospective abolition of the managing agency system, a large number of units have changed, or are likely to change, hands... Established industrialists have used the funds of companies under their control to finance their take-overs; in this, they have been abetted by banks and financial institutions which have provided, or are willing to provide them, funds ostensibly to finance their expansion without questioning the use of the companies' own funds. The strength of the newcomers has been drawn from their initial liquidity, the impact of which has been increased manifold by forward trading on margins. Once they acquired one or two companies in this manner, the process gets a further boost... Government has two possible ways open: first, it can try to protect well-managed but weakly-held companies whose shares are traded in the forward list; second, under section 409 of the Companies Act, it can prevent a change in the board of directors of a company, arising out of transfers of shares, which would be prejudicial to the company's interests. Initially, government has thought it fit to take the first course... The main problem, however, is excess liquidity which can be put to all sorts of uses. This is a matter of monetary and fiscal policies both of which have been mishandled. Other measures are only palliatives, not permanent solutions.

* * *

At its meeting on Thursday the Congress Parliamentary Board once again evaded the issues raised by the Telengana agitation... It has now become commonplace to say that the Telengana problem calls for a "political solution". Obviously, the Parliamentary Board's rejection of the separate state demand would have been more effective had it at the same time indicated what the essential elements of the "political solution" that it has in mind are... More and more Congressmen from Telengana are being forced, by the necessity of political survival, to take up fence-sitting postures *vis-a-vis* the Telengana agitation. If the Praja Samiti and the as yet unrecognised Telengana Congress Committee can keep the agitation going long enough, the division of the State Congress into Andhra and Telengana blocs might become complete. By its failure to take any kind of political initiative, the Parliamentary Board has in effect decreed that the issue be decided on the streets of Hyderabad.

NOTICE

It is nereby notified for the information of the public that **M/s Boehringer-Knoll Limited** proposes to make the application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of Sec. 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:-

1. Name and address of the applicant : **Boehringer-Knoll Limited**
   United India Building
   Sir. P.M. Road, Fort
   Bombay - 400 001

2. Capital Structure of the applicant organisation : Share Capital (Authorised)
   Rs. 200.00 lacs
   Issued & Subscribed & Paid up
   Rs. 100.00 lacs

3. Management structure of the applicant organisation indicating the names of the Directors, including the Managing/Wholetime Directors, and Managers, if any : Names, addresses and occupation of the Directors:

Name & Address	Occupation
Mr. A.D. Mango Chairman 46 Chemin des Gotettes 1222 Vesenaz, Geneva	Company Director
Mr. H. Bauder Mg. Director 63FF B. Desai Road Noorville, Bombay-26	Company Executive
Mr. K. Sedlmeier 4515 Bad Essen Kirchbreite 26 Federal Republic of Germany	Company Executive
Mr. D.P. Mehta 120 Wodehouse Road Bombay - 400 005	Solicitor
Dr. S. Agarwala 62, Ashoka Apartments 68, Nepean Sea Road Bombay - 400 006	Company Executive

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division. : New Product

5. Location of the new undertaking/unit/division : The existing factory at Kolshet Road, Thane-400 607

6. Capital Structure of the proposed undertaking : N.A. — New Product (using existing facilities)

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:
   (i) Name of goods/articles : Under the Trade name 'Bezalip'
   (ii) Proposed licensed capacity : 750 kgs per annum
   (iii) Estimated annual turnover : Rs. 115 lacs

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : N.A.

9. Cost of the Project : N.A. (using existing facility)

10. Scheme of finance, indicating the amounts to be raised from each source : N.A.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

K.J. Shah
Vice President—Finance
& Company Secretary

Dated this 10th day of July, 1989.

HDC

Good Working Results

HINDUSTHAN DEVELOPMENT CORPORATION (HDC) has shown good working results for the 15-month period ended March 31, 1989, with significant increases in turnover and profits over the previous 12 months. The company has earned a gross profit of Rs 28.47 crore compared to Rs 16.31 crore following a turnover of Rs 221.24 crore against Rs 129.45 crore. These figures also show slightly higher profit margins. Net profit has more than doubled to Rs 11.80 crore (Rs 5.14 crore). Equity dividend has been stepped up by 5 points to 25 per cent and is covered 5.55 times by earnings as against 3.02 times previously.

The performance of the company's engineering unit at Calcutta has improved considerably. Its Bamunari plant achieved higher production. The plant has developed steel castings for export to the USSR and has secured prestigious orders from the country. The company's wagon plant at Sankragachi has achieved higher production. The production would have been more but for lack of orders from the Railway Board. The Tiljala plant has received fresh export orders. To improve the track technology and to enable the Indian Railways to achieve much higher speed, a technology upgradation scheme is being studied. The air pollution control equipment division has received a prestigious order for electro static precipitators (ESP) from Rourkela Steel Plant against stiff competition. The company's engineering division in northern India has achieved higher turnover due to improvement in product mix, although production has not shown any improvement mainly due to recessionary trend in the wire industry. Demand for products of the chemical division at Haldia could not pick up due to inadequate availability of power to the ultimate buyers resulting in restricted utilisation of their plant capacities. The working of the unit was affected because of a substantial increase in the landed cost of raw petroleum coke. Cyanides and Chemicals Company, the company's chemical division at Olpad in Gujarat could not achieve higher production of sodium cyanide due to intermittent interruption in the supply of power. To overcome this problem, the unit has installed an uninterrupted power supply unit with battery back up. The unit has exported sodium cyanide of a FOB value of Rs 324 lakh. The new project for manufacture of diphenyl guanidine has commenced production during the latter half of 1988-89. The HT insulator division at Mandideep in MP has achieved 90 per cent capacity of disc insulators upto 400 KV applications. Production of solid core and bushing insulators of 220 KV and above is in advanced stage. The unit has commenced the supply against an order of the Andhra Pradesh State Electricity Board for upgradation of 66 KV transmission line to 132 KV line, which is expected to be completed during the current year. The jute division, which took a jute mill on a working arrangement basis with effect from February 1988, has performed satisfactorily.

The company has taken effective steps to set up a composite steel plant as a new division named 'Madhya Pradesh Iron and Steel Company'. To meet part of the finance required for the project, the company issued 12.5 per cent secured convertible debentures of Rs 145 each to the existing shareholders and employees. The equity capital has increased by Rs 1.94 crore on April 1, 1989 and an amount of Rs 6.80 crore has been credited to the share premium account on conversion of the convertible part of the debentures. To meet further requirements, the board has decided to issue new convertible debentures on similar basis.

SANDVIK ASIA

Improved Sales Performance

SANDVIK ASIA has performed well during 1988 with sales rising from the previous year's Rs 32.42 crore to Rs 37.33 crore and gross profit from Rs 5.91 crore to Rs 6.71 crore. Although taxation claimed a higher amount, net profit doubled to Rs 2.71 crore (Rs 1.36 crore). The directors have stepped up dividend from 20 per cent to 25 per cent which has a better earnings cover of 1.88 times against 1.17 times previously.

The company's improved sales performance came from the excellent showing of Coromant cutting tools and wear parts. The sales of the Rock tools products received a slight setback mainly due to the lack of intensive marketing efforts by selling agents for this product group. The company has taken over the total marketing responsibility of Rock tools products, in addition to its existing product lines. The FOB value of exports was Rs 65 lakh as compared to Rs 47 lakh in 1987, but the order-intake at Rs one crore at the end of 1988 more truly indicates the company's successful efforts to increase exports. The company's products found new markets in the USSR and some countries in Asia and Africa. The two technology packages of drawings and designs that the company imported from Sweden have already been taken into the manufacturing programme. The directors feel that block tool system and newer grades for cutting tools, which form this package, will support the powerful thrust for automated production in India and will be a source of inspiration for new product development ideas. Investments in automatic press robots and a new

effluent treatment plant of high control standards have been made.

FOOD SPECIALITIES

Small Decline in Margins

FOOD SPECIALITIES has turned in good working results for the year ended December 31, 1988. Sales have gone up from Rs 171.55 crore in 1987 to Rs 194.28 crore in 1988 and gross profit is up from Rs 20.64 crore to Rs 22.10 crore. These figures show a small decline in gross margins on account of rises in costs, particularly the cost of borrowing. With depreciation claiming Rs 5.47 crore against Rs 4.72 crore previously and taxation Rs 2.50 crore against Rs 5.25 crore, net profit is substantially higher at Rs 14.04 crore (Rs 10.67 crore). Two interim dividends of 15 per cent and 10 per cent were paid during the year making an aggregate of 25 per cent, which is same as last year. No final dividend has been recommended. The distribution is covered 2.93 times by earnings as against 2.22 times previously. The directors have also recommended a free scrip issue on a three-for-five basis by capitalising Rs 13.73 crore out of share premium account.

During the year, the company finalised the issue of secured convertible redeemable debentures of a total value of Rs 35.39 crore. As per terms of the issue, an amount of Rs 60 out of the face value of each debenture of Rs 160, was automatically converted into one equity share of the face value of Rs 10 each at a premium of Rs 50 per share on March 31, 1989. The balance amount of Rs 100 of the face value of debentures will remain as 12 per cent redeemable non-convertible debentures (series II), redeemable on or after the expiry of 7 years.

The new factory for the manufacture of instant coffee and instant coffee-chicory blends at Nanjangud in Karnataka was commissioned towards the end of 1988. The modernisation/expansion work at Moga factory in Punjab is expected to start contributing towards production during the later half of 1989. The foreign exchange earnings from exports amounted to Rs 7.7 crore against Rs 1.9 crore last year. The figure for 1988 includes export of instant coffee made through the Coffee Board.

NMDC

Iron Ore Exports

NMDC exported 92.95 lakh tonnes of iron ore during 1988-89, the highest so far, earning foreign exchange to the tune of Rs 200 crore. The original long-term contract for export from Bailadila provided only for export of lump ore which accounted for nearly 60 per cent of production, the rest being fines to the extent of 30-40 per cent which was dumped as waste. NMDC has now been able to develop a market for iron ore fines as well and exported 30.30 lakh tonnes of iron ore fines during 1988-89. The shipment of iron ore from Visakhapatnam Port have also been the highest so far—69.47 lakh tonnes during 1988-89. Similarly, the movement of iron ore on the K K line has also been a record—66.47 lakh tonnes during 1988-89.

IN THE CAPITAL MARKET

Arihant Cotsyn

ARIHANT COTSYN, promoted by Arihant Fabrics and Punjab State Industrial Development Corporation, is entering the capital market on July 18, with a public issue of 24 lakh equity shares of Rs 10 each at par. Of these 17.1 lakh shares are offered to the public. The company will be manufacturing polyester viscose blended yarns of various counts at its Sangrur plant in Punjab using air jet spinning technology. Mamata Machinery will provide the technology. The total cost of the project is Rs 18 crore. Debt finance is Rs 10 crore. Commercial production is expected around November this year. About 50 per cent of the production has a ready demand from Arihant Fabrics. Further, the company has an obligation to export at least 25 per cent of its production. So it does not envisage any marketing problems. However, one should not forget the recent hike in the price of viscose fibres which is a raw material for the company's products. Also, Arihant Fabrics, one of the promoters, is known to raise capital by way of public issues too frequently. Another cause of caution is the high equity capital of Rs 8 crore servicing of which will need high earnings. The issue is eligible for 80cc, 80L, 80M and 80 WT benefits.

Elcot New Era Technologies

ELCOT NEW ERA TECHNOLOGIES (ELNET) is engaged in the manufacture of aluminium electrolytic capacitors in its unit at Hosur in Tamil Nadu, which it has acquired from Electronic Corporation of Tamil Nadu. The unit has an installed capacity of 50 million capacitors per annum and is equipped with the latest plant and machinery, imported from Japan Capacitor Industries. ELNET is jointly promoted by Electronic Corporation of Tamil Nadu (ELCOT) and New Era Technologies.

Aluminium electrolytic capacitors are critical components in televisions, radios, computers and telecommunication equipment. With the rapid expansion of electronic industry in India, demand for capacitors is growing at a rate of 25 per cent per annum and is estimated to reach 460 million pieces in 1990 from 320 million pieces in 1988. The company's products are well received in the market and the company is confident of sharing the growing market for capacitors.

The project cost of Rs 337 lakh is being partly met by Rs 245 lakh of equity capital. Of the equity capital, ELCOT will hold Rs 64 lakh (26 per cent), net Rs 61 lakh (25 per cent) and public Rs 120 lakh (49 per cent). Of the public issue of Rs 120 lakh, equity shares amounting to Rs 20 lakh are reserved for firm allotment to Unit Trust of India.

The issue opens on July 3.

Sterling Computers

STERLING COMPUTERS, manufacturers of the Siva PC, will enter the capital market on July 10, with an issue of 10,000,000 equity shares of Rs 10 each, at a premium of Rs 25 per share. The company plans to diversify into new product areas, namely, lap top computers, local area network and PC FAX machines, products that are geared to answer the growing demand for office automation systems.

Swaraj Engines

SWARAJ ENGINES has been promoted by Punjab Tractors and Kirloskar Oil Engines. Both the promoters are well known blue-chip companies listed in the BSE. While Punjab Tractors manufactures tractors, self-propelled harvest combines, etc, Kirloskar Oil Engines manufactures a wide range of diesel engines. Swaraj Engines will primarily manufacture diesel engines meant for Punjab Tractors. The plant at SAS Nagar in Mishali district of Punjab, a site very close to Punjab Tractors, will produce 16,000 diesel engines per annum. Commercial production has commenced since December 1988. At present Punjab tractors is manufacturing 13,000 tractors per annum and recently it has embarked on a major expansion programme. Upon completion it is expected to manufacture 17,000 tractors per annum. Hence SEL engines have an assured market. The total cost of the project is Rs 4.5 crore, of which Rs 1.8 crore is the equity capital and the rest is debt capital. Of the Rs 1 crore equity capital, the promoters are contributing Rs 91 lakh and the rest offered for the public. The issue which open on July 10 is eligible for 80cc, 80 and 80M benefits of the ITA 1961.

Flexible Power-People Equation

Bhabani Sen Gupta

India comes at the head of third world developing countries where the cleavage between power and people has not so far turned into direct, frontal confrontation. There is no shortage of conflict in India, and the incidence of conflict will increase rather than decrease in the years to come. However, conflict in India is socialised *and* defused *at the same time.*

THE democracy movement or counter-revolutionary rebellion in China—whatever name one may choose to describe it—lends a new perspective to India's political development as a nation-state in the last forty-plus years. All the more so because India and China launched their respective careers as sovereign states almost at the same time. The two, with their telling similarities and differences, have arrived at a stage of development that, despite fundamental divergencies in their socio-political personalities, compel comparisons. The Chinese themselves say that in many ways India has done better, while there is no dearth of Indians who believe that China has gone ahead of their country in several vital sectors.

Almost in all developing nations and most of the socialist countries, there is a basic cleavage between power and people. Dictatorships—proletarian or military or authoritarian—seize power in the name of the people. They refuse to delegate power to the people. For a certain time—it may be a decade or many decades—people remain tuned to those who have seized power in their name and on their behalf. Then one of three specific situations is created.

The holders of power realise that they need active and free participation of the people to move the engine of economic, technological and political development forward, and they take the initiative to rebuild their relationships with the people. The result is a new realignment of power and people. We see this happening in the Soviet Union on a grand scale, almost entirely, uptil now, at the fertilising initiatives of Mikhail S Gorbachev. We see this happening limpingly and tortuously in Hungary and Poland where the native leaders did not have the power, until now, to seize initiatives for internal change, nor were they willing to risk experimenting with change. Popular pressures for change are far more effective in these two East European countries than in the USSR. The regimes, the ramparts of power, are far weaker than in the USSR.

In the second specific situation, the regime-holders resist pressures for change welling up from the people to the point of suppressing popular activism by force and in doing so further retrenching the power-people credibility of the political system. Rulers' failure to initiate relevant change in time from above polarises them from the people demanding change. Polarisation turns into confrontation if regime leaders are determined to resist change, and confrontation into conflict when they lurch forward to crush mobilised demands for change. This situation prevails in many third world countries. Among them, tragically, is now China.

In the third specific situation, in spite of the cleavage, there are channels of communication, interaction, adoption and compromise between the holders of power and the people asking for change. This situation exists only in democratic regimes which are not too many in the developing world. Democratic regimes' political institutions offer functional mechanisms for adoption by the rulers of some of the demands of the people. This tends to defuse confrontation and arrest conflict. The cleavage is not entirely erased. But its volume remains within control and management of the political system. Neither the regime nor the people feel totally alienated from one another.

Within the rubric outlined above, it will be correct to put India at the head of third world developing countries, where the cleavage between power and people has not so far turned into direct, frontal confrontation. There is no shortage of conflict in India, and the incidence of conflict will increase rather than decrease in the years to come. However, conflict in India is *socialised* and *defused* at the same time.

Socialised when large segments of people take part in mobilisation of demands and in clashes with a regime unwilling to concede the demands. *Defused* when conflicts remain limited to localities and do not lock the regime and the people to a frontal combat at the centre of the political system.

In the last decade and a half, India has had a surfeit of political and social conflicts. Conflicts have crowded on the political system in the 1980s. In Punjab massive military power was used to dislodge armed khalistanis from the Golden Temple, and for a fairly long time the entire state was placed under virtual military rule. Since then there have been the Gorkhaland conflict and Bodo conflict both turning violent and inviting use of force of the armed police or the military. Tripura also offers a case of limited violence used against a limited tribal youth insurgency.

Most of the regime-people confrontations in India, however, are still waged within the parameters of parliamentary democracy. Confrontations between the centre and the states (the most dramatic amongst which was the unsuccessful effort of the Indira Gandhi regime to overthrow the Telugu Desam government of N T Rama Rao in 1984 with the help of the governor) between state governments and sections of state populations, between classes and interests (the agrarian violence in Bihar, the numerous violent clashes between religious communities) are political-economic-social conflicts built into the Indian condition.

Large interest groups bring their battles to the heart of Delhi, capital city, centre of power, and sometime hundreds of thousands of people sit in for days pressing their demands. The governments at the centre and in the states often use firepower of security forces to defeat large protests. However, there has not been so far a power-people combat in independent India similar to what happened in Beijing's Tiananmen Square on June 4. Tanks have not rolled on to crush a mass protest movement involving thousands of people anywhere in India except in Amritsar in 1984 in which case the use of military power could be justified on the armed defiance of authority by the followers of Sant Jarnail Singh Bhrindranwale.

The relative flexibility of the power-people equation in India is to be attributed entirely to the parliamentary democratic system. Elections provide the oxygen of Indian politics, together with the freedoms guaranteed in the Constitution. Every election gives the confronting popular forces in India an opportunity to test their mutual strengths and weaknesses in a peaceful battle of ballots. The people have the right to change their rulers, and rulers do step down if they are rejected by

the people. The freedom to express their views, to mobilise in the open to demand change and agitate for change, the freedom to oppose and reject those who are in power give the Indian political system its inner strength. An adequate proportion of galvanised accumulated demands get adopted by the political process. This adoption blunts the radical edges of mass protests most of which, over time, get tamed and incorporated into the political system. We have seen this happening in Nagaland, Mizoram and elsewhere, and in the next year or two we will probably see this happening in Punjab.

The adoptive abilities of the Indian political system are getting stronger from the plurality of party government and the decline of the long-time hegemony of the Congress Party. One has to compare India with Mexico to realise the damage to a democratic political process single-party hegemony can inflict if it continues for a long time. The ruling party of Mexico, PRI, has been in power for nearly 55 years, and it still cannot be unseated. The result is stagnation of the Mexican economy, dwarfing of its political power, and its inability to play in the affairs of the western hemisphere the role its geography and human and other resources entitle it to play.

In India, the Congress Party hegemony was broken in 1967-69 in the northern Indian states. The Congress virtually lost its control of parliament, in 1969-71. It regained its hegemony only because of the Indian victory over Bangladesh in 1972. But within three years, the Congress regime faced its gravest crisis, adopted the gravest remedy—declaration of the Emergency—and when it was ready, or forced, to face the people in an election in February 1977, it was wiped out from power in the same Hindi belt where it had lost state elections a decade or so before.

The next decade extended the process of the decline of the hegemony of Congress rule. This time, the party lost the south. And also most of the east. Not in the same manner in which it had lost the north in the late 60s. This loss in the late seventies and eighties was to stable single party or coalition rule provided by the opposition. These governments were stable, rooted to popular support and not the offsprings of political ambitions of elected legislators. If Indira Gandhi were alive, she might have lost the centre in 1985. Her assassination gave her son, Rajiv Gandhi, a massive majority in the Lok Sabha in December 1984. But not the restoration of Congress hegemony. Indeed, there was a time in 1986 when the Congress(I) did not rule one-half of the country population-wise.

Pluralism of party government in India, then, is a historical process which has taken two decades to consolidate at the state level. The process is now irreversible. In other words, it is not possible for the Congress, that is, its ruling party incarnation, to restore its hegemony of political power in the Indian political system.

The question looming before the Indians is whether at the national level too pluralism will now prevail. Whether the Congress(I) will rule for a fairly long time more or will be replaced by the opposition this year or in the next election. The absence of a single political party to challenge the Congress(I) at the national level delays the arrival of pluralism at the centre. The Congress(I) may still win the next election and form the government in Delhi. However, the next government will not be hegemonic. It will have to contend with a strong opposition. That factor alone will leash some of its political ambitions, tame its imperial behaviour, and compel it to work more co-operatively with the opposition than it has done so far except in a lean period in the late 60s.

In the state elections in 1990, the Congress(I) will most probably lose one or more of the north Indian states where it has been ruling for a long time. That also will dwarf its hegemonic size and style. In short, India is arriving at a political stage when the political parties will have to work with one another on a long-term continuum basis. This will mean a very large element of popular participation in government, making India one of the largest participatory regimes in the world.

The advent of pluralistic rule at the state level has had many positive impacts on Indian polity. One of the most remarkable is the emergence of several 'experiment' stations within the political system. In a polity dominated by the Congress(I), the centre was the only station of experiment. Not only were developmental concepts handed down from the centre to the states, the latter had little option to experiment with administration or governance. The panchayati raj crafted in the 50s and 60s illustrates this point. A uniform partyless panchayat system was introduced in all states.

In contrast, several experiments in local government have been attempted in India in the 80s by state governments created by non-Congress(I) parties. The panchayat system in West Bengal, Tripura and Kerala bears the stamp of the CPI(M) conceptualisation. Its two variants have been installed in Karnataka and Andhra Pradesh. The cumulative impact of these three political experiments on the centre has been truly remarkable. The prime minister has made the creation of a third tier of democracy the flagship of the ruling party's election campaign. Thus for the first time in India, the centre has adopted political experiments, both in concepts and in architectures, first tried at the state level by non-Congress political parties in power.

In India, the state governments should function as 'policy laboratories' designing and developing concepts and forms of development and administration suited to the peculiar requirements of the different states. This has happened to some extent even under Congress hegemonic rule. The sugarcane economy of Maharashtra is handled very differently politically from the sugarcane economy of, say, Uttar Pradesh. However, because the Congress(I) is a command-control party, and its leadership has blocked major initiatives by state chief ministers since Indira Gandhi slapped her personalised hegemonic rule on the entire party and all governments run by it, experimentation, innovation and improvisation has been lagging on a national scale.

The important states run by opposition parties—Tamil Nadu, Andhra Pradesh, West Bengal and Haryana—have a greater responsibility than they seem to realise to make their legislatures function as 'laboratories' of alternative concepts and models of administration and development. There is no reason why these legislatures should not even intervene in national affairs. They have their right to suggest new experiments to the centre or criticise existing institutions and concepts and suggest relevant change.

In any macro overview of political development and change in the third world, India's performance must merit cheers. In spite of setbacks and distortions, despite numerous slippages and in the midst of countless contradictions, three specific performances of the Indian political system definitely stand out.

First, the democratic electoral system has woven together a huge mass of politically conscious people who have now a stake in the durability of the democratic process simply because, with all its grave shortcomings, it has given the country political stability together with space for political change and development.

Secondly, steady, if slow, pace of development has created a profile of India that makes it perhaps the first among third world countries that can be said to be 'arriving' at the threshold of development.

Thirdly, it is definitely the most adaptive political system in the developing world even when its body politic bears the scars and bruises of numerous bloody conflicts.

After all, tanks have not rolled down Delhi's Vijay Chowk to mow down unarmed, non-violent protesters.

Calcutta Diary

AM

It always begins with a symbol, whether it be a war or a revolution. The storming of the Bastille marked, more than anything else, the freeing of man's imagination. Without it there would be no storming of the winter palace, no Long March, nor the magic of Dien Bien Phu or Sierra Maestra. And since there is no quitting time for revolutions, this year's celebrations are perhaps somewhat premature.

EVEN according to the scale of the times, from Hotel de Ville to Bastille, it was not much of a march, a stretch of barely three-quarters of a mile. Once a fortress, demoted to the status of a state prison, Bastille was obviously not being put to much use in the latter capacity either. It held just about half a dozen prisoners, not one of whom could be described as a 'political' victim of the regime. The governor, De Launy, had at his command just about eighty-odd *invalides* and thirty-odd Swiss guards. Storming the Bastille was therefore not any great feat as such. But once, on the night of July 12, Camille Desmoulins could not be prevented from inciting the Paris mob to arms, what was to happen happened. De Launy surrendered, along with his men, meekly enough. Meekness did not help; the law of motion of history had taken charge, they were butchered. Louis XVI, always a little dim-witted, was slow to comprehend the meaning of meaning. It was, he thought, a revolt. Civilities were breaking down. The Duke of La Rochefoucauld-Liancourt was rude enough to correct his king: no, your majesty, not a revolt, a revolution. He stumbled on the phrase, and the French revolution was on. It is exactly two hundred years since.

Bastille became the symbol. It always begins with a symbol, whether it be a war or a revolution. And yet, in the relatively short run, it, to all appearances, achieved little for the French. The hatred, stocked up over several centuries, had to be out, there was a lot of blood-letting. It was, to begin with, a rising against arbitrary power; in its turn the revolution itself became arbitrary. Soon, it concentrated on devouring its children, Robespierre despatching Danton to the guillotine, and calmly waiting for his own place in the queue. The Jacobins, for some brief while, flaunted both on awesome vision and on awesome demagogy. They too went to meet their destiny. Marat, one-half scoundrel and one-half ideologue, perhaps took the women in the revolution too much for granted; he paid for it. Whether, as Charles Dickens would like us to believe, Madame Defarge and the rest of *les trecoteuses* did in fact pre-empt those front row seats so as to be able to watch the sliced heads tumble out of the guillotine, remains, till this day, doubtful. But frenzy was in any event universalised, with little to choose between the mindlessness of sophisticated Charlotte Corday and the foaming at the mouth by plebian women who insisted on their daily quota of syndicated killings.

For the populace as such, the immediate gains were nonetheless illusory. Amid the chaos, evidence of tangible improvements in the level of living of the Paris slum-dweller was hard to come by. The aristocrats fled, but the countryside was invaded by shopkeepers and money-lenders from the heart of Paris. They had an eye on the main chance; they set a pattern, which was to be emulated eighty years later by the carpet-baggers in the American south. True, the Declaration of the Rights of Man was on hand. In fact, there were several versions of it; that busybody, Lafayatte, was once more in an expansive mood. Between Bastille and the climacteric of the Terror, it took just about four years. The frightened French bourgeoisie could not quite retreat into the bowery of old aristocracy. They, instead, took to Napoleon. Napoleon established one major point: no divinity attaches to either monarchy or aristocracy; any chevalier, in case he had the audacity and the charm, could build an empire. The French put Bastille in cold storage, and hailed the pudgy little fellow who bestowed upon them the pleasure of his empire. It was another kind of a dizzy season for them: the thrill of foreign adventures, and the loot the adventures yielded, provided them, so to say, with an empirical correlate of the empire. Napoleon, besides, was a man of many parts. He straightened French roads, and gave the nation a legal system. He went to St Helena, but the roads survived, so did the Code Napoleon.

In due course, Bastille was rendered into innocuous social gossip, and little of *egalite* stuck to French society. It had other spin-offs though. The storming of Bastille scared the daylights out of the landowning plutocrats in country after country. It thus induced enlightenment on an international scale, at least on a European scale. The feudal set in Europe, learnt about the non-acceptable face of class exploitation: it was right and proper and necessary to indulge in plunder, but within certain boundary conditions. Inside France, between Bastille and Napoleon, the message spread: hereditary rights might or might not clash with human rights, it all depended on circumstances, hereditary rights were however purchasable, as purchasable as the ardour of a Josephine or a Marie Louise. This realisation itself was a major milestone. It heralded the beginning of social mobility. Even so, at least nine-tenths of the population, as of that moment, got hardly anything out of it. The royal families of Europe ran for cover; they intermarried, thus forming a tight cartel. The upper layer of the bourgeoisie infiltrated, with alacrity, into the arrangement. They took most of the gravy, and in exchange provided royalty with ministers, generals, civil servants, bankers. The impoverished peasantry and the still-trying-to-gather-strength urban proletariat made another major effort to emerge on top in 1848. They almost succeeded, and the next couple of years were full of confusion. There is no such category as half a revolution, as those who slaughtered De Launy and his men had unerringly perceived. France needed the full span of another twenty years, the discomfiture of defeat in a foreign war, and the trauma of the Paris Commune before she finally succeeded to get out of the habit of monarchy. By then, the strongest emerging influence was of industrial capitalism; its compulsions rendered the French republic into what it became.

Are not the celebrations this month therefore a bit of a sham? It is in any case impossible to measure in isolation Bastille's historical significance. What the past two hundred years have bequeathed is a pot-pourri of Bastille, the Terror, Napoleon and, with a time-lag, the grammar of bourgeois capitalism. True, Bastille started it all, the causality of both the Terror and the Bonapartes is rooted in it. Had the memory of the distant scare of Bastille not been there, who knows, capitalism might have manifested itself in a much more malevolent manner.

Perhaps the most important gain was encapsulated in the Duke of La Roche-foucauld-Liancourt's extra-ordinary instant summing-up. Bastille gave acceptability to the concept of the revolution. Revolutions, the point was established, are not outside the human system; they are to take place from time to time, quantities of a certain description will reach a nodal point, cross the point, and be metamorphosed into a qualitatively separate description. Once the integrity of this statement is granted, Bastille falls in place: without it, there would be no storming of the winter palace, no Long March, nor the magic of Dien Bien Phu or Sierra Maestra. Since there is no quitting time for revolutions, and the stretch of two hundred years is a mere piffle, this year's celebrations are perhaps somewhat premature. It is too early to judge, commented Zhou Enlai, what mark the French revolution would leave on human civilisation. That comment was entirely in character. The Chinese are accustomed to measure history by the yardstick of millenniums. They keep furnishing the most up-to-date evidence that, while the rest of the world might worry, they are prepared to wait it out.

Is that not then the hallmark of a revolutionary, to wait and wait until the hour is right? By celebrating Bastille we celebrate a memory, the memory of a point of time when the inchoateness of the mind turned into something more precise. There has been no stopping of either ideas or praxis since then. The storming of Bastille marked, more than anything else, the freeing of man's imagination. Or perhaps the imagination was already a-boil, it is praxis which took charge. Engels went back and discovered a peasant uprising in some remote previous century in his native Germany; while others poured cold water on the idea, he even went into raptures recounting the revolutionary potential of the English working class. Marx, a man of many parts, composed the communist manifesto and gave flesh to the theory of alienation; he also cast a sardonic look at the goings on in France in the aftermath of the Eighteenth Brumaire, even as he directed a fusillade of polemics against friends who would turn into foes by late afternoon. Bastille receded into the ground, but two separate formulations of faith embedded themselves in the consciousness of radical *emigres* billeted in different European cities: (a) revolutions are inevitable; (b) you have to wait, for revolutions take place only according to an historical schedule.

The flamboyant Lafayatte re-crossed the Atlantic and presented his friend George Washington with the key of Bastille; it now reposes, peacefully, at Monticello, Mount Vernon. That episode is however no more than a mythology gone stale. The ideology of insurrections and revolutions burns for ever, there is no physical counterpart to memory; Bastille, the old fort, had long ago ceased to exist. Two centuries later, at least a dozen boulevards converge on the Place de la Bastille—rue de Lyon, Boulevard de la Bastille, Boulevard Bourdon, Boulevard Henry IV, rúe Antoine, Boulevard Beaumarchais, Boulevard Richard Lenoir, rue de la Roquette, et al. For the romantically-bent, they at present converge into apparent contextlessness. That too is perhaps an illusion: the kiosks and the shops and the cafe bars and the restaurants and the metro, the cacophony and the bustle and the traffic, they whirl and whirl and throw a hint, the current vacuum does not necessarily indicate a permanent state of reality, Paris and France and Europe and the world are what they are because of what had happened two centuries ago, and what had happened two centuries ago is a recurring phenomenon, it might replicate itself, if not here, then somewhere else.

The spot where Bastille once stood thus waits. It waits for the new opera house to be completed, but perhaps for other, yet-to-be revolutions too. Meanwhile, though, there is divertissement: Simenon's unlikely hero from the Police Judiciare, Superintendent Maigret, lives only a couple of lugubrious furlongs away, in one of those not-too-high apartment blocks, and several of the marginal characters Simenon is obsessed with live sloppily around, on rue du Chemin-Vert or rue Boulle or Place Sajarnier. Every year on May Day, Bastille fills up, the PCF and the CGT march their cadres, the Internationale rents the air, creating an instant's illusion that perhaps the revolution—another one, following a gap of two hundred years—is a-coming. Bastille is no longer there, but Bastille remains.

TRIPURA

New Chapter in History of Insurgency

In the light of the facts that have come to light about the inspiration behind the TNV violence on the eve of the last assembly elections in Tripura, it is entirely credible that the TNLF, the new insurgent group which has surfaced in the state, is a creation of the government to create conditions for using the armed forces, in the name of containing the TNLF menace, to weed out the CPI(M) from the tribal-dominated areas of the state.

A NEW insurgent group, the Tribal National Liberation Front (TNLF), has surfaced in Tripura barely ten months after the surrender of the TNV extremists. The TNLF, which is led by Manindra Debbarma and Kala Debbarma, was formed by some erstwhile collaborators of the TNV who failed to secure rehabilitation facilities on par with those extended to the TNV extremists who surrendered. It is reported that at present the TNLF has about fifty active members. According to police sources, the TNLF has mounted a fresh recruitment drive in the tribal-dominated areas of the state. The TNLF is reported to have an arsenal of fifty country-made guns, the bulk of which were looted from tribals living in remote hilly areas of the state. The organisation is reportedly making efforts to secure sophisticated weapons from Bangladesh and, according to the chief minister of Tripura, the TNLF is getting arms from abroad. Its members are also reported to be undergoing military training in a camp situated across the border in Bangladesh in an area adjoining Raisyabari in the Amarpur subdivision of South Tripura district.

At present, the *modus operandi* of the TNLF seems to be to strike terror in the tribal-dominated areas, collect funds and commit dacoities and murders. On June 2, a tribal youth was killed by a TNLF hit squad in the tribal-dominated Esrai village in Sadar subdivision. The next day, another TNLF detachment struck in the south district in broad daylight, looting the Killa market in Udaipur subdivision and escaping to the hills. They forced nineteen people, five of them non-tribals, to carry booty from the Chhangang area and after assaulting them brutally, released them later near Bampur in Amarpur subdivision. On June 13, they raided the LAMPS office at Promodenager in Khowai subdivision. They assaulted the manager of LAMPS, tied him to a stake, and fired a few empty rounds before leaving the scene of the crime. On the night of June 28, the police ambushed a TNLF gang between Jagabandhupara and Dangabari and killed a TNLF activist. Several other activists were arrested and their country-made guns were seized.

Even as the TUJS, the partner of the Congress (I) in the coalition ministry, has decided to take the law in its own hands unless the government initiates drastic action against the TNLF in the next fifteen days, the home minister of Tripura has demanded additional paramilitary forces to deal with the TNLF menace in the state. According to reports appearing in the local newspapers, three companies of Assam Rifles will be posted in the tribal-dominated areas of Tripura to flush out the TNLF following a decision arrived at in a meeting between the chief minister and the army and the paramilitary forces stationed in the state.

In the latest act of the drama, the chief minister of Tripura has accused the CPI(M) and its front organisation of the tribals, the Ganamukti Parishad (GMP), of creating the TNLF to destabilise the coalition government. The TUJS has also accused the TNLF of unleashing a reign of terror against the TUJS workers and leaders in the tribal areas with the backing of the CPI(M).

This charge seems to be preposterous in view of the fact that the GMP has for the last 40 years championed the cause of the tribals. The CPI(M) in Tripura has a solid base among the tribals and has fought for their rights through all these years and had taken concrete steps to improve their lot during the ten years when the Left Front government was in power in the state. It is difficult to believe that the GMP and the CPI(M) will indulge in looting, killing and arson in tribal-dominated areas, eroding their own base. Besides, the victims of the violence perpetrated by the TNLF are, in many cases, members and supporters of the CPI(M) and the GMP. For example, on June 16, an armed gang of about 20 TNLF men attacked the house of Shyamal Deb at Kalabagan and took away Rs 1,500 from his father, a CPI(M) party member, Kumud Deb. On June 18 and 19, they attacked the houses of Hemanta Debbarma and Becharam Debbarma, both members of the GMP, and on June 21 the house of the CPI(M) party member, Malancha Ghosh. In these three separate incidents they looted goods worth about Rs 10,000. It is interesting to note that the five people arrested after these incidents owe their allegiance to the TUJS.

The charge of complicity of the CPI(M) and the GMP with the TNLF has been levelled by the ruling partners in the state government with a clear end in view. It has become necessary for the Congress(I) and the TUJS to mount a new anti-CPI(M) campaign in the state because in the last sixteen months, the coalition ministry has established its anti-tribal credentials and has lost its credibility among the tribals by systematically working against tribal interests. Even within the TUJS, the rank and file and especially the student wing of the TUJS are disillusioned with the anti-tribal stance of the government of which the TUJS is a partner. Tribals have died of starvation in the last sixteen months, the NREP and RLEGP have ground to a halt so that poor tribals living in rural areas do not have any work and the public distribution system has virtually collapsed in the tribal-dominated interior areas of the state. The government is not taking any measures to ameliorate the condition of the tribals. Jobs are being offered to people who were supposedly 'victimised' by the previous government without paying any heed to the reservation of jobs for tribals. Moves are on by the coalition government to destroy the Tribal Areas Autonomous District Council or to cripple it; tribal women are being raped and molested and the government is turning a blind eye to their plight. The performance of the coalition government in the last sixteen months has left no doubt in the minds of the tribals that, despite the fact that the TUJS is a tribal party, the Congress(I)-TUJS coalition government of Tripura will not uphold tribal interests. The disillusionment of the rank and file of the TUJS with its leadership because of its track record during the last sixteen months as a partner in the coalition government has naturally increased the popularity of the CPI(M) and the GMP among the tribals. This has necessitated the levelling of wild charges against them in a desperate bid to turn the tide.

Besides, the charge levelled against the CPI(M) and the demand for additional paramilitary forces to deal with the insurgent menace ring a bell in the minds of the people of Tripura. The timing is also significant. On the eve of the last assembly elections in the state in the wake of the spate of killings perpetrated by the TNV, similar links between the TNV extremists and the CPI(M) were sought to be established by the Congress(I) and the TUJS in a bid to discredit the then Left Front government of the state and to influence the election results. Even then the hollowness of the charge was clear. The TNV had been formed by a

breakaway faction of the TUJS; it was apparent even to a casual observer that most of the victims of the TNV were CPI(M) party cadres and supporters or members and sympathisers of the GMP. Members of the TUJS or Congress(I) were not attacked by the TNV. After the elections, new facts came to light which proved beyond doubt that the supposed link between the TNV and the CPI(M) was the fabrication of a fertile mind to achieve a nefarious end. Letters exchanged between Lalthanhawla and the TNV supremo, Bijoy Hrangkhawl, which were published in newspapers clearly established that the TNV was acting as an agent of the Congress(I) and the TUJS and had no truck with the CPI(M). Stationing the army and declaring the state a disturbed area without consulting the state government on the eve of the elections ostensibly to deal with the TNV menace even though the army did not fire a single shot against the TNV have left a bitter after-taste in the mouths of the people of Tripura. It may not be totally illogical to conjecture that on the eye of the Lok Sabha elections, the coalition government is trying to repeat the strategy adopted in the assembly elections to achieve its ends. It may even be conjectured that the TUJS, with the connivance of the Congress(I), is nurturing the TNLF with a view to creating an atmosphere of terror in tribal-dominated areas so that they can induct the army and paramilitary forces in these areas ostenisibly to contain the TNLF menace but in actual fact to harass the CPI(M) and GMP members and supporters. This trend is already noticeable. In Sadar, Khowai, Amarpur and Sabroom, the armed forces have been active in harassing innocent tribals and members of the CPI(M) and GMP in the name of flushing out the TNLF. To give a concrete example, on June 21, Jyotindra Debbarma, a supporter of the CPI(M), was handed over to the police by the TUJS in Jirania as a member of the TNLF.

The Lok Sabha elections are just round the corner and a certain section of the armed forces had been used in the last assembly elections to usher in the coalition government in the state. Is it then far-fetched to think that the TNLF is a creation of the powers that be to turn the ensuing elections into a farce by using the armed forces to weed out the CPI(M) and the GMP from the tribal-dominated areas which are their strongholds in the name of containing the TNLF menace?

Paharia Tribals' Plight and Government's Indifference

Indu Bharti

In March-April this year over 200 tribals died in the tribal districts of Bihar of what the government described as a 'mystery disease'. However, to those familiar with the tribal areas of Bihar and with the conditions in which the tribals live, the outbreak of the epidemic was hardly a surprise nor its cause a mystery.

IN March and April this year at least 225 tribals died of a disease described till as late as the first week of April as 'mysterious' in the four tribal districts of Singhbhum, Gumala, Ranchi and Sahebgunj in Bihar. The mysterious disease, later identified as pyogenic meningitis, first struck the Kolhan region in Singhbhum district and later spread to the neighbouring districts.

Reports of deaths due to 'a mysterious disease' in Bandijore village of Tonto block in Singhbhum district began to reach the state capital in the last week of March. They spoke of tribals dying after developing symptoms such as severe headache, vomiting, shivering, stiffening of neck, high fever, etc. Thirty-five people reportedly died in just one fortnight in this village alone.

Though the disease first broke out in Tonto block, it was Manoharpur block which accounted for the largest number of deaths. Twelve villages in this block were ravaged by the disease and at least 130 persons died. The largest number of deaths occurred in Dangla village where about 60 tribals died. The other affected areas were Goelkera, Khentapani, Nuamundi, Jeraikela and Jagaunathpur blocks in Singhbhum district. In all around 185 deaths took place in Singhbhum , while Gumala and Ranchi districts accounted for 16 deaths each and 30 died in Litipara and Warijore blocks of Sahebgunj district. The mysterious disease also reportedly spread to the neighbouring tribal areas of West Bengal, Orissa and Madhya Pradesh.

How did the epidemic break out and why only in the tribal areas? According to the local administration it could be food poisoning or the bad effects of 'hadia' (the tribals' domestic liquor) or the bite of meningococcal or neonrococcal or staplococcal or ades or culex insects. The government doctors are not sure about the cause but they have identified the disease as pyogenic meningitis.

Familiar Situation

To those familiar with the tribal areas, the outbreak of the epidemic was hardly a surprise nor its cause a mistery. Most of the tribal villages do not have clean drinking water. Either the tribals have to go to far off places to fetch water or they have to drink the water of the same polluted ponds and channles which they use for bathing and washing their cattles as well. Medical facilities are almost non-existent and so the tribals have to go to the 'ojhas' who exploit them by telling that their sickness is due to this or that 'bhut' (ghost) and demand money, meat and liquor from them to please the 'bhut'. The tribals also lack the wherewithal for a bare meal everyday and their calorie intake is starkly inadequate. Their resistance to disease is thus extremely poor.

The last few years have made matters worse, as south Bihar has been reeling under an acute water crisis. The government has declared the districts affected by the epidemic as a drought-prone area. The unabated denudation of forests has affected the ecology of the region and with each passing year rainfall becomes more deficient. The underground water level has gone deep down and most wells in the rural areas go dry in summers. The state departments of public health and engineering and irrigation have acknowledged that the water level of the Suvarnarekha, the biggest river in the region, has gone down significantly.

In the 1988 summer the tribal region of Bihar experienced an acute drought. The tribal villages and the poor tribals were naturally the worst sufferers. At several places the tribals resorted to agitation, including actions such as road blockade, for water. There were also reports of death due to meningitis, malaria and so on, attributed to use of polluted water, though it did not take the form of an epidemic. While early rains provided some succour, the tribals had to face a water crisis again after August-September as the rains had been scanty. So the tribals had to return to the same polluted ponds and trenches and there were deaths due to diseases once again.

Though the outbreak of the 'mysterious disease' was reported only in March this year, deaths with similar symptoms had begun as early as December 1988. For instance, in Bandijore village six deaths preceded by ailments like high fever, headache, vomiting and stiffening of the neck took place in December-January. Lungadi Munda, the village headman, was quoted by several newspapers as having said that the first of such deaths had taken place in August last year.

Poor Health Facilities

Government officials and doctors have sought to deny that drinking of polluted water has been the cause of the epidemic. On April 1, the Singhbhum district civil surgeon had told local journalists that contaminated water was the cause of the epidemic and that until the tribals were provided with clean drinking water they would continue to die. However, on April 4, following state health minister Dilkeshwar Ram's

denial in Patna that drinking of dirty water was to blame, the civil surgeon also went back on his statement. But report after report published in newspapers in Patna spoke of tribals being forced to use water from dirty ponds and trenches and visiting doctors from Patna, jamshedpur and Ranchi warned the tribals against using such water.

The officials have also sought to blame the tribals for not going to doctors for treatment allegedly because of their faith in 'ojhas' and 'jhar-phemk'. But in most cases the tribals have to go to the 'ojhas' because no medical facility is available to them. The tribal villagers of Bandijore had their first glimpse of doctors and health workers only in the last week of March this year.

Lungadi Munda has said that he had informed the Tonto block medical officer of the deaths from the mysterious disease as early as February but the latter did not thought it fit to visit the village, let alone provide any treatment. It was only on March 19 that the assistant civil surgeon reached the village and a team of doctors from Jamshedpur followed. By then another 12 tribals had died and the death toll had reached 24. The doctors, after elaborate tests carried out on 25-odd persons, identified the disease as pyogenic meningitis. Still the disease continued to be described as 'mysterious'. Even the district civil surgeon continued to term the disease as malaria. Even after the disease was identified, proper medicines were reportedly not administered. For around a week or so, the patients continued to be given antibiotics while the required medicine, gamaglobolin injection, was not supplied to the village.

The worst sufferers were the Paharia tribals, whose population is in any case fast dwindling. The epidemic claimed at least 25 lives of Paharias in the Sahebganj district of Bihar. In Guttibeda village under Baric block, inhabited by Mal Paharias, the epidemic claimed 12 lives. Seven others died in Sunder village, two in Barijore and one each in Kolakha and and Telo, as per the official version.

But as most of the villages inhabited by Paharias are 'inaccessible', the death toll may well have been more. Even the district officials have expressed the fear that the actual death toll may be more. A report in a Hindi daily *Hindustan* on April 1 said that around 75 Paharias had died due to the epidemic. The Paharia villages are so 'inaccessible' that the team of doctors sent from Patna failed to visit most of the villages. For instance, Kherigoda, Karikan, Ambeda, Deedma, Holjar, Kamodani, Ambada, Goda and Devdand, though affected, failed to get any medical help during the epidemic. The team of doctors could visit only three villages, Guttibeda, Sahara and Rexi.

The first information about the deaths due to the 'mysterious disease' had been received by the administration as early as February 24 from the mukhia of Gobindpur panchayat, Mohan Mishra. But it was only when it learnt of the 25 deaths in Guttibed and Sunder villages that the administrations activated itself. The deputy development commissioner visited Guttibeda village in the second week of April and sent an SOS to the health directorate in Patna and a team of doctors could reach the village only on April 11.

Moneylenders' Hold

The Paharia tribals eke out a living by undertaking kurva cultivation on the hills and collecting forest wood and selling it. They grow only coarse grains like bajra, maize, etc. The land they have is so insufficient that their agricultural produce is not enough to sustain them. Moreover as a committee of the state assembly said in a report submitted in 1987, most of the land belonging to the Paharias is in the grip of moneylenders. Exercising their first claim on the produce of the Paharias' land, the moneylenders purchase the grain grown by the Paharias at a meagre price and then resell it to them at exorbitant prices, when the Paharias have exhausted their small stocks of grains and feed. A recent study by the Santhal Paraganas Antyoda Ashram on Paharias living on eight hills of Godda district could not find a single Paharia who was not caught in the moneylenders' trap.

The coarse grains that they grow constitute a fraction of the Paharias' diet. Mostly they depend on wild herbs and even grass. Meat of dead animals constitutes another staple food of the Paharias and they are in constant search of dead animals as that provides them something to eat without having to pay for it.

Medical facilities are almost non-existent. The assembly committee found that health centres opened by the government in the Paharia villages were only on paper as the doctors preferred to stay in the district or sub-divisional headquarters and paid only occasional visit to the health centres.

Some years ago another assembly committee had suggested instructing the educated Paharias about primary health measures and providing them medicines for treatment of common diseases. But it was found that, leave alone provision of medicines, not a single Paharia had been trained in primary health care.

All this has made the Paharias prone to diseases like tuberculosis, polio, white leprosy, blindness, goitre, epilepsy, typhoid, kala azar, etc. The recent study by the Antyoda Ashram found that there was not a single Paharia family in Godda district free from one or the other of these diseases. Consequently their population has been fast dwindling. According to the report of the assembly committee, the population of Paharias fell by 9,000 during 1960-70 and by another 6,000 during the decade 1970-80. The committee observed that the main reasons for the decrease was malnutrition and use of polluted drinking water and the resultant diseases.

Naturally, minor children have been the worst hit. The Antyoda team which undertook the field study found the number of children below five years of age in Paharia families to be negligible. Similarly, the number of Paharias above fifty years was also found to be negligible.

Sixteen Paharia families now live on Belmakh hill under Sundarpahari block of Godda district. Two decades ago there were 40 families. The 16 families have 90 members, eight of whom have diseases like tuberculosis, leprosy, goitre and epilepsy. Even a four-year old child was found to be afflicted with tuberculosis. On Keshri hill only six families exist today wheras just a decade ago there had been eight. The two families had fallen prey to starvation and disease. The existing six families have 22 members, four of whom are suffering from diseases like tuberculosis, paralysis and epilepsy.

All the Paharia families living on these two hills are in the clutches of moneylenders. And these two hills are not the exceptions but the rule. In every Paharia hamlet that the team visited, it found the same situation, dwindling population, disease and starvation.

Nor is the plight of the Paharias confined to Godda district. The same team had undertaken a study in the Banjhi block of Sahebgunj district. There also it came to the same conclusion—that the population of the Paharias is rapidly dwindling due to polluted water and malnutrition and the resultant diseases.

Facing Extinction

Though the Paharias are known to be nearing extinction, the government has not taken any concrete steps to improve the lot of the Paharias. The assembly committee had recommended way back in 1982 the establishment of health sub-centres in Paharia hamlets and referral hospitals in the Chandan block of Godda district where there was a concentration of Paharias. But nothing has been done in this direction in the seven years since then.

In its 1987 report the assembly committee found that government programmes like reclaiming hilly and baren land, timely supply of fertilisers, seeds and agricultural implements were not being implemented seriously in the Paharia dominated regions. The committee also found that little was being done to release the Paharias' land from the clutches of the moneylenders. In its 1982 report the committee had recommended construction of colonies in the plains surrounding the hills to settle the Paharias. But five years later the committee found that due to the constant negligence of the revenue department, neither residential nor agricultural land was made available for distribution amongst the Paharias.

The Bihar government has been carrying on a Paharia welfare scheme. Under the scheme villages are selected for various welfare programmes and the Paharias are

provided seeds, agricultural implements, cattle and also loans. But more often than not the seeds are of poor quality and the cattle of poor breed. The Antyoda team found that not a single head of cattle provided by the government was alive today.

In the pre-independence days cultivation of Sabai grass used to be a major source of cash income for the Paharias in the Rajmahal hill areas. But due to lack of adequate government support for the development of Sabai grass cultivation, they had to gradually abandon it. Total production of Sabai grass in 1945 was 10 million quintals which dropped to a mere 400 quintals in 1980-81 and the present annual production of Sabai grass is hardly 100 quintals (in 1907 it was over 18 million quintals). Nothing shows better the government's apathy to the sorry plight of Paharias.

Some Agrarian Questions in the Jharkhand Movement

DN
GK

Questions regarding building an agrarian movement and the participation and rights of women have to be taken up in order to strengthen the Jharkhand movement.

CLOSE to two years after the formation of the Jharkhand Co-ordination Committee (JCC) some features of the current phase of the movement can be identified. In the first place the current phase has been distinguished from earlier phases by the predominant position of students and youth, organised under the banner of the All Jharkhand Students' Union (AJSU), in the agitation. These students and youth are largely urban residents and it is the towns that have been the main centres of the agitation. Numerous bandhs testify to the importance of the urban areas in the present movement.

Another feature distinguishing the current phase is the large presence of the non-adivasis, referred to as *sadans*, in the movement. Sadans are present in the leadership of the JCC. And a close identification of the sadan groups as a whole with the Jharkhand movement is noticeable. This shows that Jharkhand as a nationality issue and not merely as one of tribal problems is firmly established. The participation of sadans in the tribal-led peasant revolts is, of course, nothing new. Such participation is evident in the uprisings in the area, whether those led by the Santals or those led by the Mundas. With the transition to a nationality demand, the connection between the tribals and the sadans has, however, become stronger.

AGRARIAN MOVEMENT

Along with the above, some other features of the present movement should also be noted. The first and most important relates to the role of an agrarian movement as a component part of the Jharkhand struggle.

Historically, land has been closely associated with the political struggle in Jharkhand. The connection was very direct in the numerous eighteenth and nineteenth century peasant uprisings in the area, the most prominent of which were the Santhal *hul* and Munda *ulgulan* in the middle and end of the nineteenth century, respectively, and the Bhumij movement in Orissa in second quarter of the twentieth century.

The connection between land and the political struggle in Jharkhand has continued into the present day. The peasant uprising of 1969-70 in Debra-Gopiballavpur, spilling over into Baharagora and other adjoining areas of Jharkhand, is part of the history of Jharkhand. In the mid-seventies, outside Dhanbad, the spread of the Jharkhand Mukti Morcha was closely linked to militant mass movements for the recovery of land and other assets seized by the moneylenders.

Forest issues have not been as prominent as those of land. But it should be remembered that the Chota Nagpur Tenancy Act, enacted after the uprising led by Birsa Munda, recognised not only the right to land but also, in some places, the community's right to the forests. These *khuntkatti* forests still remain as remnants of community rather than government ownership. In the mid-fifties Palamu witnessed a movement for 'jungle raj' led by the Kherwars under Fetal Singh. In the seventies and eighties opposition to deforestation, monoculture of eucalyptus and the like have appeared on the agenda. The problem of deforestation has merged into another problem—the typically modern one of displacement due to dams, mines, factories, cantonments and the like.

There is a close identification of the Jharkhand communities, tribal and non-tribal alike, with both land and forests. Which is why revolts have always followed attempts of imperialists and their Indian agents (landlords, moneylenders, bureaucrats, etc) to deprive them of their rights to the land and forests.

That the national question is essentially a peasant question is borne out in the case of Jharkhand. Further, taking up peasant issues is vital to drawing the broadest rural masses into the political movement for Jharkhand. There is the additional facto[r] that forest questions, though they are no[t] peasant ones, are important in Jharkhand particularly so for those with less or poore[r] quality land and for the women, who as [a] rule have control over their own earning[s] from the sale of forest produce.

In the period just before the formation o[f] the JCC there were some ongoing peasan[t] movements in parts of Singhbhum, Palam[u] and Gumla, led by the Jharkhand Krant[i] Dal and PCC, CPI(ML) combine. But thes[e] have been more or less liquidated. A solitar[y] action a few months ago against forest-cutting in Gumla is all there is to show. Instead there is just participation in a serie[s] of conventions or, at best, the enforcing o[f] bandhs. Participation in these bandhs has been of a limited nature. Sometimes peasants have been involved in large numbers, as in cooking on the roads on some occasions. But such mass participation too has been fitful and not deliberately planned for. On the contrary, there is at least one instance of a demonstration being cancelled in favour of sensationalist actions.

There are a number of ongoing struggles of the peasantry, as, for instance, in the opposition to dams, or for higher compensation in these matters. But such struggles are being conducted on their own, and there is no connection between them and the Jharkhand movement. Neither the JCC itself nor its constituent organisations have made any attempts to link up these various struggles with each other and with the movement for a separate state. Sibu Soren's Jharkhand Mukti Morcha (JMM) has long since abandoned such land and forest struggles. On the contrary, many cadres are busy taking money from the contractors and, in return, helping them to denude the forests.

The large-scale participation of students and youth is a positive factor. But it has to be turned into good account so that the vital issues of Jharkhand become central to the movement. Burning of degrees, as has been done by a number of the leading students and youth, needs to be followed by a campaign for them to take up the task of building a peasant movement. Militancy requires a proper mass base and that can only be the peasantry. The role of the peasants is not just to provide shelter and so on, but to actively, as an armed people, resist the state. Minus the active participation of the peasantry, militancy will degenerate into terrorism or worse.

POSITION OF WOMEN

Another feature of the current movement relates to the discussion on 'cultural regeneration'. The values that characterise tribal identity have been held, for instance by Ram Dayal Munda or Nirmal Minz, to be harmony with nature, equality in society and collectivism in economic activities. There has been much discussion on the necessity of linking the movement for Jharkhand with that for 'cultural regeneration'. on the basis of the above-

mentioned values. In this move for cultural regeneration, how is the position of women to be seen?

It is one of the proud boasts of the Jharkhand movement that women in tribal society are not of as low status as are women in mainstream Hindu society. Both in the family and in society adivasi women certainly have a more prominent position than do women in the developed class society of the plains. But this relatively superior position should not blind one either to its rapid erosion or to the 'traditional' inequalities.

There are two crucial areas of inequality —property rights and political participation. In all the Jharkhandi tribes property, particularly land, passes through the male line. Along with this, it is the practice that women after marriage go to stay in their husbands' homes. So, the society is both patrilineal and patrilocal. Further, women perform a major portion of the total social labour. The result of their labour is accumulation in male hands.

As mentioned, women do not have a right to inherit land. It is mainly as widows that they do have some definite rights in land. But these rights have been eroded over time. Against the earlier right of widows to manage their late husbands' lands, until their minor sons grew up, and even after that to continue to keep a part of the land for their own maintenance, it has now become merely a right to be maintained, i e, to be fed and clothed. In legal terms this has been degraded to a *khorposh* (maintenance) right from the earlier usufructuary right.

Being fed and clothed does not leave the women with any independence of action. Further, such a grant is always liable to be reduced to the barest possible minimum. The right to manage land, including the right to mortgage it, is a far superior right, one which leaves the woman with considerable scope for deciding her own affairs. But such a usufructuary right, comes in conflict with the desires of the late husband's male relatives to grab the land. It is the struggle to degrade this residual usufructuary right that is the political economy of witch-hunting. In opposition to this, it is necessary to fight for the implementation of *khorposh* as a usufructuary right and not as maintenance grant.

The question of granting land rights to women has often been seen as a matter that would affect the integrity of tribal society. The Jharkhandi tribes have, as long as is known, been patrilineal. But is patrilineality an essential characteristic of that which may be called the tribal system? It should be noted that the Khasis, a north-eastern tribe speaking a language of the same group as the Mundari languages of Jharkhand, have a matrilineal system. There is, of course, no invariant relation between patrilineality and tribal society.

The values that characterise tribal identity have been held, as mentioned earlier, to be harmony with nature, equality in society and collectivism in economic activities. The collective or the 'community' is, however, defined to comprise the male kin group who, for instance, supposedly collectively own the *khuntkatti* lands. Why should the community not be redefined to include women, not only as producers (which they are today) but also as owners, along with men? Such a redefinition of the community will only make it more inclusive and increase the collective character of the production system. If anything, including women as full members of the community, will enhance the collective character of tribal society.

Will land pass out of tribal, or even of particular clan or lineage, hands in the event of it being given to women too? This is an often-repeated fear. The experience of the Chinese land reform, however, suggests that it need not be so. In each village, the community allotted land individually to all its members, men and women. Women who married out lost their right to land in their natal village and acquired it in their marital village. The land that had been allotted to women who married out, was in turn re-allotted to women who married into the village. Provided land is not alienable, or only alienable within the community, as is the case with tribal land under the Chota Nagpur Tenancy Act, land rights to women would not lead to land passing out of tribal hands. The integrity of the tribal community, connected as it is with the community's ownership of land, would not be weakened; on the contrary, it would be strengthened.

Upholding the customary law of the tribes does not mean that there should be no change in it. In fact, customary law remains customary law only if it changes with the times, changes as custom requires. To change customary law is a matter to be taken up within the community, not a matter to be taken to some Supreme Court. But upholding customary law and standing for the necessity of changes in it being taken up within the community, should not become excuses for insisting that there can be no changes in present-day custom. Custom is custom only because it changes.

The other important question concerning women is that of political participation. The traditional panchayat is virtually an all-male institution. Membership is of the head of a household or someone else in his stead. It is only in the rare circumstance that there is no suitable male in the household that a woman may be a member of the panchayat. Besides women, youths too are not members of the panchayats. In *khuntkatti* areas households of non-owning tillers (*praja* as they are designated) are also not represented in the panchayat. Further, the chief offices in these panchayats, those of the *munda* (village headman), *manki* (area or *parha* chief) and *pahan* (village priest) are restricted to particular lineages (*khunts*).

There are thus various undemocratic features in this traditional system of participatory democracy. Women, youth and those of subsidiary lineages (normally relatives from the female side) are the ones discriminated against. When taking a position in favour of strengthening the traditional panchayat system, as against the system of the Indian state, it is necessary to also move for modifications in this system so as to be make it more fully an instrument of the community. Such a transformation is necessary if the panchayats are to serve as instruments of change.

Strengthening the traditional institutions would in fact be possible only if they are more attractive to all members of the community than the institutions of the Indian state. If women are to be excluded from the community's political institutions, but are offered 30 per cent of the places in the Indian state's gram panchayats, will it be possible to convince women that the traditional institutions, which give them no scope for political participation, are in fact better? The youth, who are the main force in the struggle, can they be excluded from the political system that the movement intends to strengthen?

Questions about the property (land) rights of women and women's political participation have figured in both the conferences (1987 and 1988) of the Jharkhand Mahila Mukti Samiti. Leading women cadres in the Jharkhand movement have also written about them. Thus, these questions are not just something being raised by those outside the movement. Rather, women in the Jharkhand movement are themselves raising these matters. With changing expectations of various sections of the tribal community, custom needs to change. As pointed out earlier, taking account of the changing expectations will only strengthen the tribal community, while it is precisely failure to take account of these changing expectations that will weaken the community.

The above questions regarding building an agrarian movement and the participation and rights of women need to be taken into consideration in order to strengthen the Jharkhand movement. They are not matters to be left for 'afterwards'. Rather, ignoring them will only weaken the movement and jeopardise its long-term prospects.

'We Demand Our Rights'

Refugee Women's Long Journey

The processes by which the women workers in the so-called production-cum-training centres run by the Delhi administration are being made into refugees for the second time in their lives are but a reflection of the larger trends at work in the country's economy and polity.

SADDA HAK, ETHEY RAKH, "We demand our rights", was the slogan of the 300 women, who went on relay hunger strike and dharna from April 6-20, outside the house of the home minister, Buta Singh. The women are all piece rate workers who work in the *silai* centres (officially described as production-cum-training centres) run by the Delhi Administration. They were agitating, among other things, against the threatened closure of their Centres. The dharna in the scorching heat of Delhi's summer was an extra-ordinary sight. Many of the women were above sixty. Some of the women had walked from their homes in far off places in the city to Buta Singh's house, and they did this every day of the dharna. But perhaps what was more striking is their background. Many of the older women were forced to abandon their homes in West Pakistan and came here during partition, or *batwara* as they refer to it. They were among the 4.9 million refugees who came to live in India in 1947-48. Rendered homeless, wave after wave of migrants flowed into their new homeland, their new nation. Many, like these women, lost their husbands, children, families and, more often than not, all their possessions.

The experiences of these women, both individually and collectively, with India's development is a chronicle of the insensitive and undemocratic functioning of our democratic institutions. But their travails and struggles are also a reflection of the strength and spirit of our people that keeps our democracy alive. This report seeks to document the process by which the refugee women from Pakistan, four decades later, reached the house of the home minister of independent India.

I

In the nineteen production-cum-training centres spread across the city of Delhi, there are at present about 300 piece rate women workers. Many of the senior workers among these were refugees. At their native places they belonged to diverse backgrounds, some from Sind and Baluchistan but mostly from West Punjab, and from different castes of Hindus and Sikhs. Their families were engaged in diverse occupations ranging from a fairly well-off owner of a steel furniture shop in Gujaranwala, to petty traders in Lahore city and to a small cultivator in a village near Lahore. The common thing that binds them together was that they were all victims of the *batwara* and they are all women. Eighty-year old Veeranvali, still working in the centre at Kalkaji, came from Adi Naroli village (district Jhelum), in a foot convoy. During the partition over one million such people reached in 24 foot convoys that took eight to twenty days to reach their destination. Devi Bagya, whose husband owned a *kirana dukan* (grocery shop) in Karachi, came later. From Karachi, the mass migration began only after the first major riots in January 1948. Divya escaped, with the help of her brother-in-law who worked in the police, and reached Jodhpur. After three months in Jodhpur and a few more at Jhansi, she reached Delhi. But she joined the Kalkaji Centre only in the early sixties. Premavati, whose cultivator husband was killed in the riots in a village Kana Kacha, near Lahore, came with her three-year old son and joined the Centre at its inception. Her son now lives separately and she is self-dependent. Sheelawati, from Toba Tek Singh, with her husband and infant children, reached Attari, the frontier station, by train. She stayed for a month in the camp at Kurukshetra. The camp city at Kurukshetra, then a vast expanse of land between Karnal and Ambala, was the largest camp of the time. At its peak it housed 3.63 lakh refugees. From Kurukshetra, Sheelavati reached Delhi. Her husband was already a chronic patient of tuberculosis. He was admitted in the TB hospital at Kingsway camp where he died after years of illness. In the meantime Sheelavati admitted her children in the government-run home at Jullundar and joined the Centre in 1952. Rukman came from Lahore in 1947 and lived as a destitute on the pavements of Delhi for some years before she joined the Centre at Chandni Chowk, where she still works. Ranjit Kaur was in her teens when she came, with her father, from Lyallpur. The canal colonies of Lyallpur were the source of the largest caravan of refugees, consisting of four lakh people, that trekked its way along the 150 mile road to East Punjab. Ranjit Kaur, having studied only up to fifth standard and that too in Punjabi medium, was not eligible to join the training courses offered at the Centre in Connaught Place to which her father took her. But soon, through private study, she became qualified and joined as a trainee in 1955. Today, she is the principal of the Chandni Chowk Centre! At the other end of the spectrum is an old woman. She must have been in her forties at the time of the partition. During the riots her daughter, sons and their wives jumped into the well in their house and committed suicide. She came here, all by herself and eventually joined the Centre at Hudson Lines, Kingsway Camp. But two years ago, in 1986, the Centre was closed down, as the barracks at Hudson Lines were demolished as part of DDA's city improvement programmes. Some of the older women at the Centre got themselves transferred to the Centres at Lehna Singh Market, Malka Ganj and Indra Nagar, Azadpur. But by then this woman had begun to lose her eyesight, having been engaged in stitching uniforms over long years, eight hours every day. She also became too old to travel to any of the centres even within north Delhi after her own Centre was closed. Today she is bed-ridden without any financial help from the government for which she worked for 37 years.

Altogether by 1951, about 1.75 lakh refugees came to settle in Delhi city, excluding the trickle that continued for a few more years. About 40 per cent of them were women. The measures initiated for the rehabilitation of refugees by the ministry of relief and rehabilitation that was set up in September 1947 were understandably *ad hoc* in their nature, given the magnitude of the problem. Transit camps, relief centres, rehabilitation homes, vocational and technical training centres were all part of these measures which eventually led to the more systematic production-cum-training centres.

II

These Centres came into existence in February-August 1948. To begin with, there were about 8 Centres, all in Delhi, with about 441 women workers. Meanwhile the concerned ministry itself was reorganised on a more sound footing. Its name too changed to ministry of rehabilitation (1949). The Centres, which were then under the director general of resettlement and employment, were transferred to the department of rehabilitation, Delhi administration. Soon they became very popular. By 1951, for instance, there were 13 Centres with about 1,880 workers. In some of the newly set up Centres, the women were expected to bring their own

sewing machines. Their monthly earnings in the early fifties ranged from Rs 12 to Rs 50.

Over time, however, the composition of the women workers in the Centres seems to have changed. A number of women from UP, Rajasthan, and Delhi itself, who were not refugees, also began joining the Centres. The middle aged among the present workforce are generally not displaced people from Pakistan. Among the Centres we visited workers from refugee families numbered 15 out of 22 women in Shankar Market Centre, 8 out of 15 in Lehna Singh Market Centre, 9 out of 15 in Kalkaji Centre, and only 5 out of 15 in the Centre at Chandni Chowk. Some of the older women have died while a few may have found better opportunities in private tailoring agencies. But since private agencies usually prefer, as one of the women told us, *kunwari ladkiyan* (unmarried girls), the option was clearly not available for all of them. Nor did they have financial resources to set up their own firms. In any case, presently only about 220-225 women out of a total of about 300 women are from refugee background. The passage of time, it appears, has erased the finer distinctions between refugee women from Pakistan and destitutes generated by independent India.

The chequered administrative history of these Centres reflects both their changing character as well as the government's own ambivalence towards them. In 1957, the 13 Centres with about 900 workers were transferred back to the central government, ministry of rehabilitation. But the western wing of the ministry was closed down in 1960 and the Centres were then transferred to the ministry of works and housing; they then moved to the ministry of labour and finally to education and social welfare. They were with ministry of social welfare till 1974. At that time there were about 19 Centres with 1,075 workers. Their average monthly wage was in the range of Rs 45-400 in this period.

But in 1974 they were transferred back to Delhi administration, under whose authority they presently rest. Thus in the last forty years, the administrative control over these Centres changed twice from central to state government, and within the central government they changed four ministries while within the state they changed two departments.

But at the field level, there were not many changes, except perhaps stagnation and decay. Each Centre is headed by a principal, usually a woman, a master tailor, usually a male, and one or two teachers. Including those in the central cutting centre, at Lajpat Nagar, these technical personnel number about a hundred. They are all permanent employees of the government. The principals are in the pay scale of Rs 340-800 while for the teachers the scale is Rs 220-550, equivalent to the UDC and LDC scales of the Third Pay Commission. The chequered administrative history of these Centres seems to have made them step children of the Delhi administration. But the same is not the case with the peons and attendants who are transferable to any other wing of the administration, and who are receiving the revised scales.

Initially, although almost all the Centres offered training, the emphasis was on production. Now the focus is shifting somewhat from production to training. Presently the Centres offer a short duration non-certificate course, a one year certificate course and teacher training course. In all about 2,100 girls in non-diploma course and 260 women in other courses received the training in 1988-89. In three Centres new courses in typing, shorthand, secretarial practice, and beautician's course have been introduced. Some of these courses are also affiliated to the Technical and Training Directorate. Gradually the Centres seem to be on their way to become some sort of women's polytechnics which is a source of anxiety for the workers in the production wing.

The main work of the production wings of these Centres, where most of the refugee women are employed, right from the beginning consisted of stitching liveries for the employees of government and other public enterprises. But in between there was also some amount of production for sale. The production of fine embroidered linen, readymade garments and handicrafts for sale was related with the establishment of the famous Refugee Handicraft Shop in Connaught Circus in 1956. For a number of years, the shop was run on a commercial basis, and it generated considerable profits. Located in a rented place in E block, it faced a crisis when the owners pressurised the government to vacate the premises, presumably because of the increase in the real estate value of the shop in the prime shopping complex of the city. After a fruitless existence at Khan Market for two years, the shop was shifted to the premises of the production-cum-training centre at Shankar Market. For the women, this meant a reduction in their working space against which they agitated. But in any case the shop could not make any headway. From a turnover of Rs 7.72 lakh, five years ago, the sales came down to Rs 3.68 lakh last year. Presently all fresh production and supply is at a standstill and the government is disposing of the existing stock at heavy discounts, with a view to closing down the shop altogether. The decline of the shop also reduced the volume of work for these women in the Centres.

The major source of earnings for these women has always been stitching uniforms for the third and fourth class employees of the central government, and other undertakings like post and telegraphs, DTC, DESU, etc. Bulk orders from these organisations, in times past, provided them with enough earnings to make a decent living. But from about the mid-seventies the work got privatised. Private tailoring agencies, some of which were set up by the retired master tailors themselves, bagged the contracts. In seasons when the work is very low, the women are allowed to work on private orders, or small time jobs from their neighbourhood, in the premises of the Centre itself. For this the Centre charges them (and continues to do so in case of any private work) a commission of 20 per cent for such work.

But in any case this private work was not their major source of earnings. Their wages came from the work orders of the central government, that remained with these Centres. But for some years now, the employees federations have been agitating for cloth and stitching allowance instead of readymade uniforms. Presumably, it ensures better fitting uniforms and perhaps adds some extra amount to their meagre cash incomes. This year the government conceded their demand. In effect it has meant stoppage of an already declining volume of work. And on March 4 this year the department of personnel, ministry of home informed its decision in a circular to all the Centres. Hence the dharna at the house of the home minister.

III

The organised struggle among these women, in a rudimentary form originated in the Shankar Market Centre. It was at their own initiative and was led by one of the senior workers. In 1977 they held, for the first time, a demonstration at the office of the directorate of the rehabilitation services, Delhi administration (Jamnagar House, Shahjahan Road). Their demands in the initial stages were related with wages.

The convoluted system of wages for these women as it evolved over time, reflects the authoritarian structures that govern their working conditions. First, the department of personnel sets the standard rates for stitching the suits, varying according to the cloth and type of the suits. Then it awards the contract to these Centres. The volume of work thus awarded, however, has no definite pattern. For instance, the total bill fluctuated anywhere between Rs 3 lakh and Rs 9 lakh per annum throughout the period from 1965 to 1974 when the rates remained practically the same. Obviously someone somewhere in the bureaucratic labyrinth decides what proportion of the total volume of the work should be awarded to these Centres. There are no prescribed quotas or set

guidelines. After the award is made, the cloth is collected from different offices and enterprises at the central cutting centre in Lajpat Nagar from where, after cutting, it goes to all the nineteen Centres. The guideline here is that the work should be distributed equally among all Centres and all workers. After the stitching, the bills are prepared on a monthly basis. Till a few years ago, the government deducted 25 per cent from the total amount due to the workers for the use of its Centres. But that is not the end of the story.

The women have to bear the expenses for accessories such as buckram, zippers, cloth lining, etc. According to the administration these costs are included in the rates fixed. But in the perception of the women, this expenditure forms too high a percentage of the amount paid to them and therefore cuts down on their actual earnings. In fact, we feel the situation is much more complex. Given the variety of garments and the other things that the women stitch, no pre-fixed wage can include the actual expenses incurred by the women. For example, unlike the rates that remain fixed for years, the costs of accessories are subject to frequent increases. In any case, according to several women, not all the rates for the different items allow for the inclusion of costs. Often, whether or not costs are included depends on the nature of the relationship with the master tailor or the principal. Given the arbitrary nature of this entire system, after the different deductions and expenses have been made, actual wages work out to much less than the women's due. Needless to say, the rates fixed by the home ministry are noticeably lower, in any case, than market rates.

In the first agitation in 1977, they demanded abolition of the 25 per cent deduction (towards the Centre's charges) and increase in the rates. Under pressure from the agitation the government suddenly 'discovered' that the women had actually been entitled to higher rates since 1974. So, the government conceded only what it had been legally obliged to do four years ago. But on the real question of abolition of the commission there was silence. More important than their immediate gains and losses was that the agitation enabled the women to get to know women from other centres who had hitherto been unfamiliar to them. The 1977 struggle laid the seeds of a more organised trade union.

Thus in 1982, the Social Welfare Mahila Karmachari Union came into existence. Led by the CPI(M) leader, Primilla Pandhe, it is affiliated to the Centre of Indian Trade Unions (CITU). One of the first agitations of the union was concerning the Refugee Handicraft Shop. Later in December, the women workers held a seventeen day dharna at Jamnagar house, demanding abolition of the 25 per cent deduction, increase in rates, regularisation of service, and old age pension.

The government consistently rejected the demand for the regularisation of service of these women, on the grounds that they were piece rate workers who do not have a continuous service with the government. The frequent and farcical administrative changes mentioned earlier, complicated their case further. The government holds that the nature of their work is of temporary and casual nature, and hence they can only be piece rate workers. As a matter of fact the status of casual, temporary and contract workers within the formal organised industry, especially public sector, has been a source of many militant struggles and legal battles. Railways, post and telegraphs, coal mines, transport services, have all had this component of the workers. In 1974, in a pioneering judgment in the case of railway workers, the Supreme Court held that while laying down a particular railway line may be a job of temporary nature, laying down railway lines in general for the Indian Railways is a permanent job, and thus declared all the casual railway construction workers hitherto employed on piece rate basis as permanent employees. This legal precedent should have been made applicable to these women. But it seems they have been denied it as the government has treated them not as workers but as recipients of its patriarchal benevolence. In this context we may recall that the Centres were once, briefly, under the ministry of labour before they were condemned to the category of 'social welfare'.

After a seventeen-day dharna in 1983 the government rejected the demand for regularisation of service and old age pension but conceded the wage related demands and abolished the 25 per cent deduction and also increased the rates. After the struggle the earnings of these women improved. However, from around the same time the volume of the work began to fall. According to the women this was a punitive measure directly related to the struggle. In any case the bulk of the work relating to uniforms from most of the public enterprises stopped. However, other kinds of work, like bags for the postal department and aprons for hospitals, continued to trickle in. But the women complain that these kinds of orders, demanding more strenuous work, get them very little. The net wage for stitching a postal bag for instance, is just about Rs 3. More importantly, the volume of the government's own orders came down. The situation seems to have worsened during the last year or so when a marked preference for privatisation informed the government's policies. Thus, despite an improvement in their wages, their earnings, presently an average of Rs 300 a month, remained practically the same. The recent circular announcing the government's decision to grant cloth and stitching allowance in cash to the employees thus sounded like a death knell in many Centres where the earnings dropped to about Rs 140. The union conducted its dharna against the threatened closure of the Centres. The other major demand was old age pension.

At the end of their fourteen-day dharna, the government gave them a written assurance that the Centres will not be closed down. But we fail to understand the meaning of this assurance. Already Centres are on the decline. In Kalkaji the present Centre is only one-third of its original space area, in Shankar Market it is half, while in Lehna Singh Market it is about three-fourths of the original space area. The fact that the real estate value of these premises has increased manifold seems to be one of the contributory factors. This is evident not only in private owned premises like the Malviya Nagar Centre (whose present value, we are told is about Rs 20 lakh) and Lehna Singh Market but also in the case of Centres where the government itself is the owner. Plans are afoot to build new structures both in Kalkaji and Lajpat Nagar. We have already noted the shifting focus towards training and the decline in the volume of the work. The number of workers, we should recall, came down from its peak levels of 1,500-1,800 to the present 300. In the absence of any measures to increase the volume of the work, the assurance is likely to lose its meaning. What the government should ensure is the volume of work.

The government also conceded the demand for old age pension. But the operative element of this agreement also raises a host of questions. For example, the case of those who stopped work in the last few years and are presently not on the rolls, like the old woman from the demolished Centre at Hudson Lines mentioned earlier, is left unclear. In any case, of the Rs 200 per month conceded (in place of Rs 300 demanded), Rs 100 is to be part of the wider central government scheme for old age pension whose eligibility conditions these women have to satisfy in the first place. The other half is to come from the discretionary funds of Delhi's lieutenant governor. Assuming all the hundred women past the age of sixty become eligible for the pension the expenditure per annum for the government works out to be Rs 2.4 lakh a year, to be shared equally between the central government and Delhi administration. We may note here that this amount is a pittance for the state, for it is about ten per cent of the real estate value of just one Centre.

But yet Rs 200 per month as pension

is a significant gain for the women. They have won one more battle and for the present the dharna is withdrawn. It should be recalled that the demand for the abolition of the 25 per cent deduction in the 1977 agitation was conceded in the 1983 struggle, while their demand for old age pension in that struggle is conceded in the 1989 dharna. Perhaps even the authorities have been forced to acknowledge that these women cannot be silenced. As an administrator grudgingly said: *in auratan da moon kaun band kar sakda hai.*

IV

The struggle of the women workers of the production-cum-training centres, given this long journey, has more things to it than those reflected in their immediate demands and their monetary significance. For, they worked hard against unfavourable circumstances both at their workplaces and in their homes.

The most striking thing about their work conditions is that they are subjected to all the formal rules and regulations that time-rate workers are usually subjected to. These include fixed eight-hour daily schedule, six day week, attendance register, and monthly payment. But, needless to add, they never received any benefits of regular workers.

At the Centres no arrangements were ever made for creche facilities. The machines they work with still remain the hand-operated sewing machines, the oldest model that was introduced in the twenties. The women have to sit on the floor, bending for hours together. The work is tough on the body and, with some of its detail, hard on the eyes. Almost all of the older women we met are suffering from eye problems. In Lehna Singh Market, an old woman in her sixties stitches with the help of only one eye. Electrification of many Centres took place only in the sixties. Yet even now lighting in some of the Centres is poor. In some Centres the space is also congested. The relations between the piece rate workers and the staff appear to be generally friendly, perhaps because some of the staff themselves share the same refugee background as these workers. But relations may at times be tension-ridden. In one Centre we found that the master tailor used to deny the women entry even if they were late by five minutes. He would also frequently hurl abuses at them. In another Centre, the principal herself is a source of continuous friction. In fact any rigid hierarchical structure becomes more authoritarian in the case of piece rate workers, especially if they are women. These women workers struggled against these kinds of circumstances, and established themselves. Perhaps the nature of the production organisation, a half way house between home industry and factory, also helped them to survive. For such an organisation and the space it provides also helped them to forge more human bonds among themselves. In the absence of creches, they take care of each other's children. They help more fragile and older women by sharing their burden. In Lehna Singh Market we found two women, themselves in their sixties, who sometimes share their earnings, with another older woman who can no longer walk to the Centre. The Centres thus also provide them a source of strength to survive collectively their individual hardships. The women have come to value their collective strength whose best reflection was the dharna that we visited.

But theirs is not only a collective battle but also a struggle at the individual level with their family circumstances. Most of them have had their homes shattered and lives battered. And this does not apply only to refugee women. Some of the other women also have practically no men to depend upon. A sixty-year old woman we met in the Malviya Nagar Centre, for instance, had two sons who now live separately while her husband is a chronic alcoholic. She has worked in the Centre for the last three decades. Another woman, who has been working for twenty five years, was deserted by her husband. She brought up her sole child, a daughter, who is now married and lives separately. Their earnings, even when they are meagre, mean a lot for them. In fact this is the case with some of the young and middle aged women presently working in the Centres. We found, in our visits to their homes, that the extra income for the lower middle class family is important for their survival. The monetary significance of the earnings may not be much in the case of some of the older women whose children are relatively well settled. The earnings or pension, here, represent their hard-won self respect. For the social attitudes towards old people, especially women, within the family are not always sympathetic in our environment. Some of the older women talked to us about the treatment they get from their sons and daughters-in-law. Thus the earnings of these women workers have both a monetary significance and a cultural importance. But women, especially those from such background as these women, often become the 'ideal recipients' of charity and benevolence from the patriarchs that govern our state and society. A low self-image of the 'beneficiaries' is usually the product of such patriarchal norms. But these women struggled against such images and norms. Over the years they established for themselves a relatively decent life, brought up their children, and rebuilt their homes through hard work. Their struggle against their family circumstances thus is closely linked with their status and struggle as workers. It is this simultaneous struggle both at home and the workplace that enabled them to acquire a self respect. When we visited the dharna, these *buddis* (old women), as one of the women said, appeared to be proud that *is umar me bhi ham sadkon pe aaye hain* (even at this age we have come on the streets).

In sharp contrast it is our democratic institutions that have failed them. The maze of bureaucratic wrangles in which the Centres lost their way and the consequent insensitivity, the irrationality of the system that makes their earnings remain the same even when their wages are increasing and the corruption involved, the illegality of the government's refusal to regularise their services and the impunity with which it has got away with it, the privatisation that is now afflicting the Centres—all establish in a revealing manner the failure of our institutions. In turn, these trends are but a reflection of the larger processes at work. A development strategy that marginalises more people than it employs, a ruling elite that loots more than it produces, a bureaucracy insensitised by its own procedures, a polity that becomes more authoritarian as it becomes more corrupt and the patriarchal norms that inform all these institutions and programmes are part of a wider process by which these women workers are being made into refugees for the second time in their lives.

But these women no longer consider themselves as refugees or destitutes looking for charity and benevolence, but as workers who rebuilt their homes and lives in the process of producing for the government. An old lady, who appeared to be in her seventies, told us how she used to carry her sewing machine on her head from Nirankari colony to Lehna Singh Market, a distance of four kilometres, everyday for four years. Not only that the bus ticket (ten paisa in those days) was expensive for her but it was also difficult for her to get into the bus with the machine on her head. It is these kinds of experiences that made the common refrain among them, *ham bheekh nahi mang rahe hain* (we are not asking for charity). In that sense their fight is a fight for the right to live with dignity, that forgotten rhetoric of the freedom movement with which their story began. Democratic sections of independent India owe them support and solidarity.

[This article is based on a report prepared by the People's Union for Democratic Rights, Delhi. PUDR acknowledges the help and co-operation it received from Social Welfare Karmachari Union, the Centre for Indian Trade Unions (CITU) and the women workers of the Centres.]

Tiananmen and the Uncertain Legacy of Reform

B Gopalakrishna Kumar

Events of the past few weeks have shown that despite the glib talk of reform, the Chinese political system remains an odd mixture of discredited autocrats and confused modernisers, incapable of any but the crassest response to a genuine challenge to its authority. The ultimate tragedy in the events of June 4 and thereafter may therefore be to preserve the notion—comfortable to those currently in power in China—that economic progress without political reform is possible.

AFTER a weekend of brutal carnage on June 3-4, and elaborate follow-up operations, the Chinese army now seems in full control of Beijing city, and is moving rapidly to quell agitations in the provincial capitals in similar fashion. Rumours of a split within the PLA and the prospect of a protracted civil war now seem much less credible than they once did at the height of the turmoil. Numerous arrests and a systematic and ruthless policy of liquidating any individuals seen as spearheading agitations appear to have successfully cowed down any further protests.

Despite the immense cost in terms of lives lost, not to mention the loss in the international standing of the country, the crackdown would seem to have achieved its primary purpose from the point of the regime: to eliminate an alternative source of power within society, and to consolidate the position of the current trio in power: Deng Xiaoping, Li Peng and Yang Shangkun. This process reached its natural culmination with the recent dismissal and humiliation of the party leader Zhao Ziyang, and the appointment of the Shanghai party boss Jiang Zemin as general secretary.

There is every reason to think however that this will only be a temporary reprieve for the government. To begin with none of the elaborate disinformation currently being fed through radio and television regarding the nature of the movement and the bloody response to it can hope to convince the mass of the Chinese population who lived through April and May. Popular disaffection with the nature of the regime currently in power is such that fresh protests are bound to spring up at some time in the future. Even more important, the authorities are now so dependent on terror and sheer force of arms, and the institutional basis for party rule so weak, that some sort of overtly political role for the army now looks a distinct possibility. An authority on Chinese politics, Roderick MacFarquhar, recently raised this question when (writing even before the army crackdown) he remarked: "The army is one of the twin pillars of the communist revolution and it retains an institutional credibility long lost by the Communist Party. . . each time China's civilian leaders have called on the army in the past, the step has posed the threat of the army assuming a dominant role in party councils." If so, a substantial change in the shape of Chinese politics which may have rather important implications for the progress of the reform policies so assiduously followed by China's post-Mao leadership may well be in the offing.

In fact, among the many images of protest that emanated from Tiananmen Square in the heady weeks before June 4, along with the majority which concerned the essentially political demands of the student movement and reflected the declining legitimacy of the current Communist Party leadership among the younger generation in the country, a few did articulate more fundamental issues related to the vast changes that have swept Chinese society in the last decade, and it is important to appreciate these to see the current situation in perspective. Problems like corruption, growing disparities and unemployment figured prominently here. That this should have been so underscores some serious difficulties with the reform programme.

Despite a number of achievements against very heavy odds in the forty years since Mao Zedong's accession to power, the Chinese economy has been dogged by poor performance and inefficiencies in a number of critical sectors, and these came to a head in the mid-seventies, a period that saw the death of both Mao and Zhou Enlai and the accession of a new group of politicians to power.

The emphasis on regional self-sufficiency in foodgrain production and the neglect of prices as a regulatory mechanism had seriously distorted the patt of agricultural production although it h to an extent succeeded in controlli regional disparities in consumption. addition the manifest need to push up t rate of economic growth had resulted a chronic tendency towards overinve ment (sometimes referred to in writin on eastern Europe as 'accumulation bi in socialist economies) and to a decline emphasis on current consumption need Indeed it is not often realised that t Chinese economy of the immediate po Mao period was providing living sta dards not markedly different from tho of the mid-fifties (Carl Riskin, *China Political Economy*, OUP, 1987). By t time of the famous central committ meeting of 1978, it was clear that son far-reaching changes in economic manag ment were in the offing.

The reforms in the period since the la seventies aimed principally at reducin what was seen as the overbearing functio of central authority in economic manag ment. A greater role for the price mecha nism as opposed to quantitative contr was therefore envisaged. In agricultur this implied a gradual dismantling of th commune system, and a substantial in crease in farm prices as a means o stimulating economic incentives. It als meant an end to the policy of centrall directed local self-sufficiency in grain an the encouragement of diversification an specialisation in agricultural productior In the industrial sphere, the reforms sa an expansion of local-level autonomy with enterprise being allowed to keep share of profits and to exercise mor authority over production and suppl decisions. Complete quantitative contro on supplies of some important inter mediate goods like steel was replaced b a two-tier regime which emphasised both price and quantity signals. Finally an concomitantly, on the international front the eighties witnessed a steady increase i China's participation in the internationa economy, and a great willingness to impor sophisticated foreign technology as means of industrial upgradation and modernisation.

Despite the fact that a number of these policy changes were conceived and exe cuted in haste the macro-economic per formance of the Chinese economy saw marked improvement in the decade since the reforms, underlining both the effect of incentives and the extent of previous misallocation of resources. The success of the reforms was particularly evident in agriculture where the incentives given to production gave quick results. A commonly used measure of agriculture performance, the gross value of agricultural

output, grew by 9 per cent per year between 1978 and 1984—a higher growth rate than for any previous period—and this boom has lasted till the very recent past in which some difficulties in maintaining agricultural production have set in (*Beijing Review*, May 1-7, 1989). Agricultural growth was accompanied by a diversification of rural activities, and in particular a noticeable increase in the expansion of the so-called sideline rural industries which have proved very important in generating rural incomes.

Industrial growth for the period 1979-85 averaged 10 per cent per annum. This was respectable but by no means outstanding; unlike in the pre-reform period however much of the increase came from light industry, in line with a policy of curbing the excessive growth of heavy industry. The reforms were on the other hand much less successful in improving efficiency and in curbing duplication and waste economy-wide. An indication of this relative lack of success is that labour productivity in state enterprises has hardly showed any improvement in the last decade.

On balance, however in terms of the impact on income and living standards, these continuing inefficiencies mattered much less than the spectacular progress in agriculture. In fact it is probably a structural feature of the Chinese economy that agricultural growth has a much more proximate impact on rural consumption levels than industrial growth has on urban incomes. Thus, in the ten years since 1978, while consumption levels of the whole population rose steadily, rural consumption levels recorded dramatic increases: indeed they more than doubled between 1978 and 1984.

This trend however had a number of less palatable consequences, unintended though perhaps inevitable, and the increase in rural-urban disparities is but the first of these. A look at the recent trend in earnings shows why this should be such a live issue in China today. Currently a university professor might get 200 to 300 yuan a month; an agriculturist on the other hand could get ten times as much, and so could a trader. The widening gap between town and country, and further between the petty bourgeoisie and the bureaucratic elite has featured prominently in Chinese debates in the recent past, and there are indications that the celebrated Dengist snub to Mao's egalitarianism—'everyone eating from the same pot'—may itself have been disowned.

Whatever the status of these debates, there is little doubt as to the further effects of the vastly improved purchasing power of previously low-income consumers. Pressure on the availability of current consumption goods increased dramatically, and, correspondingly, incentives to produce these also expanded. While in theory it would have been possible under the earlier planned regime to control the production and availability of these consumer goods, in a decontrolled system, production was determined more by the incentives given by market signals. A further effect was to fuel competition for raw materials and encourage the diversion of scarce resources away from other sectors to production of consumer goods, thereby also increasing import requirements.

To weather all this without unbalancing the economy would have been a signal feat for any society, and it is no surprise that China did not quite manage it. Infrastructural bottlenecks became increasingly severe throughout the eighties, as did shortages of important raw materials. More importantly, price inflation, hitherto remarkably stable and moderate, began to rise. After a decade of upward pressure, the inflation rate touched 30 per cent in the first half of 1988, sparking panic buying and endemic shortages of key items; by 1989 the inflation rate had only moderated to 27 per cent.

With salaries staying well below the pace of price increases, inflation hit the urban workers and intelligentsia hard, and merely served to heighten their sense of disparity, and their disillusionment with the effects of reform. Also, and equally importantly, against the background of selective liberalisation, rising prices gave a further fillip to corruption and speculation, phenomena already latent in Chinese society. While inflationary price expectations naturally encouraged hoarding, a regime of partial quota allocation (as opposed to a fully planned one) made it easier for bureaucrats and politicians to extract their share while allocating important resources. The American political scientist Michel Oksenberg has commented that "high officialdom is the first to enjoy the fruits of modernisation. Arrogance, corruption and abuse of office in China and elsewhere afflict a bureaucracy removed from those it governs." Such tendencies survived and even prospered under the new dispensation.

Finally, the change in the style of economic management and the restructuring of industrial enterprises had a further consequence for China's growing labour force. This was to increase the number of people who could not be absorbed and hence remained unemployed. It is evident that the worst hit category would be the school leavers and recent graduates from China's numerous colleges of higher education and that this would only add to the feelings of frustration amongst the younger generation in the country. An official report in *China Daily* recently admitted that the unemployment rate this year will rise from the average 2 per cent of the last five years to 3.5 per cent, and there are indications that the rising trend could be maintained in the years to come.

Inflation and related economic worries on the one hand, and corruption and loss in political legitimacy on the other, both attest to the difficulties associated with rapid economic change in a society as vast and as complex as China. It is possible in fact that the very success of the reforms in terms of faster growth and increases in incomes would have masked the less appealing aspects that were to follow. Also, what the recent past in China has indicated is that economic changes rapidly bring in their wake disparate social forces and new political aspirations. Absorbing these requires a political system that is much less rigid and a political culture that is much more in tune with the reality on the ground. Events of the past few weeks have in fact shown more starkly than at any other time that despite the glib talk of reform, the Chinese political system remains an odd mixture of discredited autocrats and confused modernisers, incapable of any but the crassest response to a genuine challenge to its authority. The ultimate tragedy in the events of June 4 and thereafter may therefore be to preserve the notion—comfortable to those currently in power—that economic progress without political reform is possible.

No 'Counter-Revolutionary Clique'

A Special Correspondent

Now we know that the Chinese emperor has no clothes. Whatever they may say about the nature and inspiration of the student movement, the authorities will not be able to return China to what it was before June 4.

TAIWAN: It is very difficult to cover an event like the Tiananmen massacre from distant Taipei even though the vision of the square remains so strongly in one's mind that one can almost see the event as it occurred. The June 16 copy of *Asiaweek* has some marvellous pictures of the advancing soldiers on Changan avenue bearing down in full battle array on hundreds of abandoned bicycles, whose owners, totally unarmed, have already been shot at and have fled for safety. That same magazine also has an hour-by-hour discription of the various events of those 24 hours. But *Asiaweek* is not unique in its coverage. The TV programmes have for the most part been very detailed and crowds in public places have gathered around TV sets at news times. It is said that there have been over a thousand reporters or news gatherers in Beijing and it has been almost totally impossible to prevent news being immediately relayed outside China. There have been no restrictions on the use of overseas telephones and over most of China in the larger cities students have broadcast news about China from overseas through public address systems. For example, in Changsha a huge public meeting was held almost immediately after the Beijing incident fuelled by broadcasting the information from the Voice of America. The national controlled broadcasting media do not have a chance today. How was it possible to talk about the 'counter-revolutionary clique' when one could see with one's own eyes that for the most part they were totally unarmed civilians? In spite of this, however, one can see that the soldiers were in many cases frightened at the false information on which they were fed. One soldier who shot an unarmed woman with her baby was literally torn to pieces by the woman's two brothers who were nearby. Soldiers who realised that they had for the most part been deceived and that there was no counter-revolutionary clique, did not automatically feel that they should fraternise with the population. The first lot of soldiers who 'tested the waters' unarmed had guns stored in their tanks and armoured cars to use if necessary.

Let me now deal with some of the general points which can be seen from these events. Firstly, it is clear that there is no student 'organisation' with a common political standpoint. Delegates who came to the square from their own universities could remain or return as they wished. They had no 'instructions'. The government will not find a leadership or organisation. The 41 wanted photographs on TV are individuals, not part of a conspiracy.

Secondly, not all students had the same idea about how to achieve more freedom. While they were certainly anti-government, especially against certain individuals, they did not have any other country as a model which they wished to emulate. They most certainly did not regard Taiwan as an alternative and they refused to receive any money directly from Taiwan if they knew its source.

Thirdly, I do not think that anyone conceived that troops would be called out at all within the boundaries of Beijing. Conscription to the PLA has been abolished well over ten years ago and there is a strong competition in rural areas to get nominated by the local rural committee to join the army. The common soldiers are much more sophisticated than was formerly the case and I doubt whether an illiterate person could possibly be nominated. On the other hand, they do not come from any elite (as for example, one could regard the citizens of Beijing as an elite or university students as an elite). This would tend to make them more compliant to the orders of their commanders. One knows less about these commanders today however and the units are not organised on a personal basis as used to be the case. One cannot say what their attitude would be if they were ordered to fight other units recruited from different provinces, as the provincial characteristics (and languages) are certainly not so important now as previously when it was the eighth route army.

The position of an army unit today is very different from that of an airforce or navy unit for it is extremely likely that most present-day armies will be used to fight against the country's own citizens (Ireland, Burma, Taiwan as in the 228 incident, China in Tibet during the cultural revolution, India in Sri Lanka against Tamils, Indonesia; the list is long). What makes the Beijing incident important is that it took place in Beijing where tea[...] has never been used and, as a Japa[...] commentator pointed out, there is no[...] specialising in crowd control. Bombay, 30th June 1989

THE BANK OF TOKYO LIMITED

(Incorporated in Japan Liability of Members Limited)

NOTES ON ACCOUNTS FOR THE 15 MONTHS PERIOD ENDED 31ST MARCH, 1989

(1) No provision has been made for:

(a) Rs. 15,683 being balance in inter-office account, The Bank of Tokyo Limited, Karachi, outstanding since 1965 and considered doubtful of recovery.

(b) Interest accrued on advances considered doubtful of recovery/sticky of Rs. 3,72,50,693.

(2) On the basis of certificates from Bank's auditors at their head office, Tokyo, specific provisions and the general portion of 'Reserve for Possible Loan Losses' created by the bank in its books at the Head Office adequately cover the provision required for bad & doubtful debts in the Indian Books.

For the purpose of the above provision, surplus in securities available with the bank has been considered on the basis of bankers' right for lien and set-off.

(3) Interest and Discount:

(i) is net after adjustment of interest on advances considered doubtful of recovery/sticky of Rs. 87,13,345 which is related to earlier year.

(ii) includes interest written off in earlier year since recovered during the period Rs. 2,49,227.

(4) As in the earlier year:

(a) depreciation has been provided at the rates specified in the Income-tax Act, 1961 instead of the rates specified in Schedule XIV of the Companies Act, 1956.

(b) certain expenses like insurance, rent, rates & taxes, etc. has been accounted for on cash basis instead of accrual basis.

Since the quantification of the above has not been made by the branches the impact of these on the current period profit is not determined though may not be material.

(5) (a) Head Office administrative expenses have not been charged in the accounts and provision for taxes had been computed accordingly.

(b) Rent, Rates & Taxes include Rs. 8,82,65,220 being provision for income-tax (including Rs. 14,72,192 for prior year).

(c) Other receipts, include Refund/Provision for taxes in respect of prior years written back Rs. 1,74,11,374.

(d) Other expenses include Rs. 95,378 being customs duty paid on office equipment sent by their Head Office.

(6) In some cases the balances with other banks are subject to confirmation by the respective parties.

(7) Inter-Office accounts includes Rs. 1,01,76,000 received from Head Office for the acquisition of residential premises for Bank's Officers in terms of the sanction of Reserve Bank of India.

AUDITORS' REPORT

1. We have audited the annexed Balance Sheet of Indian Branches of the Bank of Tokyo Limited, as on 31st March, 1989 and also the annexed Profit and Loss Account for the 15 months period to that date in which are incorporated the returns from Calcutta and New Delhi Branches, audited under section 228 of The Companies Act, 1956 by other auditors.

2. In accordance with the provisions of Section 29 of the Banking Regulation Act, 1949 read together with the provisions of sub-sections (1), (2) and (5) of Section 211 and sub-section (5) of Section 227 of The Companies Act, 1956, the Balance Sheet and Profit and Loss Account are not required to be and are not drawn up in accordance with Schedule VI to The Companies Act, 1956. The Accounts are, therefore, drawn up to conform with Forms A & B of the Third Schedule to the Banking Regulations Act, 1949. Subject to the foregoing observations, we report that in accordance with sub-section (3) of Section 30 of the Banking Regulation Act, 1949:

(a) We have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

(b) the transactions of the Indian Branches which have come to our notice have been within the powers of the Bank;

(c) in our opinion, proper books of account, as required by law, have been kept by the Indian Branches of the Bank, so far as appears from the examination of those books, except to extent of compliances of Section 209 3(b) of The Companies Act, 1956 owing to non-accrual of certain expenses;

(d) the report on the accounts of Calcutta and New Delhi Branches of the Bank, audited by the respective Branch Auditors, were received and properly dealt with by us, while preparing our report;

(e) the Balance Sheet and the Profit and Loss Account dealt with by this report are in agreement with the books of account and the returns;

(f) in our opinion and to the best of our information and according to the explanations given to us the said accounts give the information required by The Companies Act, 1956, in the manner so required, for Banking companies and subject to:

Note 1: (a) regarding non-provision in the accounts for balance in inter-office account considered doubtful of recovery;

Note 1: (b)

& 3: (i) regarding non-consideration/adjustment of interest on advances considered doubtful of recovery/sticky;

Note 2: regarding provision for doubtful debts having been made by their Head Office at Tokyo, Japan;

Note 4: (a) regarding provision of depreciation as per Income-tax Act, 1961;

Note 4: (b) regarding certain expenses being accounted for on cash basis;

and read together with the other notes, give a true and fair view:

(i) in the case of the Balance Sheet of the state of affairs of the Indian Branches of the Bank as at 31st March, 1989; and

(ii) in the case of the Profit and Loss Account, of the profit for the 15 months period ended on that date

Rural Development in Many Hues

Bhabatosh Datta

West Bengal Landscapes by Arun Ghosh; K P Bagchi and Co, Calcutta, 1989; pp 323, Rs 200.

LATE in the autumn of 1983, Arun Ghosh "landed in Calcutta to take up the task of planning—and decentralised planning in particular— in West Bengal". He describes himself as "an outsider and a traveller in West Bengal". He was born in Calcutta but his parents went to north India when he was only six months old. He had never lived in West Bengal, but he had trained and perceptive eyes to see everything from a fresh angle. Perhaps, as a Bengali trying to see Bengal with an incisive and also affectionate vision, he had an advantage over the local experts who think that they know the state inside out.

Ghosh came to West Bengal with wide experience in the field of economic policy-making—national income unit, World Bank and the IMF, ministry of industry and mines, Bureau of Industrial Costs and Prices and many others, including high-level committees. But rural Bengal was new to him. He tried therefore to know rural Bengal from direct contacts, with an uninhibited angle of vision. The result is a 'travelogue'—written during 1984-86 with a touch that appears superficially light, but is replete with deep observations which only a first-order economic analyst can make.

He had difficulties. There was for example, "the inherent contradiction in attempting genuine decentralisation under an administration supposedly imbued with Marxist philosophy". The other difficulty arose from the fact that the government was a coalition of many partners, all professing to be leftists, though not necessarily Marxists. Ghosh is bold enough to say that "even among the leaders there are some who may not have really understood Marxist literature". He feels that there are many possible booby traps in the path of decentralised planning, but "if the experiment does not succeed in West Bengal, it is unlikely to succeed anywhere else in India, at this point of time". This was written before the new noises about panchayati raj that have been sweeping over everything and also before the prime minister's commendation of the West Bengal experiment.

The two major achievements of the Left Front government are, first, the registration of about 1.3 million sharecroppers, who have been vested with permanency of tenure and, secondly, the attempt to implement plan projects through the panchayats. The major failures lie in power generation and in industrial growth. Basically, it is the rural programmes that have been the important ones. The Leftists have lost the urban base on which they had once mainly depended. It is the rural programmes that Ghosh has described and analysed in his travelogue.

The coverage extends to the whole of West Bengal and it includes also Tripura. The areas studied in detail cover Purulia, Murshidabad, the Sunderbans, Tamluk, Bankura, Coochbehar, Jalpaiguri, Birbhum and Malda. He was accompanied in his travels sometimes by ministers, sometimes by party leaders and, of course, always by officials, but his tours here not guided ones. He saw and praised, where praise was due. He saw and asked uncomfortable questions where he felt doubts.

For example, on a visit to the Tamluk area to see a rural development project of the Comprehensive Area Development Corporation (CADC), he asked why a marketing centre had been established at a village for the sale of cotton yarn, when there was no local production and when the entire supply had to be brought from Calcutta. And then, why a marketing centre for helping private traders and not a co-operative purchase society of the weavers? Latrines were built with no proper arrangement for cleaning the septic tanks, but, in this case, there was no problem because nobody used these facilities. The bushes and the open fields were preferred. Above everything, there was the question of costs. When the organisers showed 'low-cost' projects, the obvious question was about the large magnitude of overhead costs—starting from the central office in Calcutta.

Another facet of rural planning in West Bengal comes out in the chapter on 'District Planning: Malda Style'. The district authorities—the elected sabhadhipati of the zilla parishad and the district magistrate in particular—were entrusted with the task of framing the district plan for their area. Some of the district plans so framed were commendable, such as those of Midnapur, 24 Parganas, Burdwan, Jalpaiguri and, to a lesser extent, Birbhum. In their midst, the Malda plan (which in fact was not a plan at all) went astray and required reformulation under top-level guidance. The plan funds were to be spent through the panchayats. The Malda plan arranged to spend all the funds through contractors. The local legislators and political leaders tried to have their way and favour the local contractors ("the contractors are local people and they have to live"). When confronted with the charge that they had not complied with the guidelines, their answer was that they, as elected representatives of the people, knew the problems better.

The bureaucracy had played an almo[st] disreputable part. "The DM of Malda h[as] recently left on a foreign assignment aft[er] (obviously hurriedly) putting together a s[et] of schemes, *intended to keep all the politic[al] heavyweights happy*" (emphasis added). T[he] political bosses, Ghosh states, need a plia[nt] and amenable bureaucracy. He has no hes[i]tation in holding that "perhaps it is an err[or] to get the MLAs and MPs involved". [In] Malda they had their way in proposing th[e] utilisation of the services of contractors an[d] in putting a large part of the allocations f[or] the district town. There was "no focus o[n] minor irrigation, no focus on the openin[g] up of the hinterland by the construction o[f] well-planned, inter-connected, all-weathe[r] roads, no focus on rural employment an[d] education, no focus on the basic problem[s] of the district and their solution". Fortunate[ly], the planners were persuaded to refram[e] the entire scheme of things, but it require[d] much effort from the deputy chairman an[d] members of the state planning board.

Ghosh took a 'busman's holiday' on th[e] Ajodhya Hills in Purulia, near the Biha[r] border. There is a dig at the poshness of th[e] CADC guest house, but the Purulia ex[perience], on the whole, was encouraging. H[e] notes the interesting fact that the tribal[s] themselves can select the right locations fo[r] tube-wells more accurately than the learned geologists. "We are apt to disregard the instinct, born from experience, of the people rooted in the soil." And then there are the usual problems. The 'gobar gas' power plant, installed at a high capital cost, developed a leak and remained dismantled. The long chapter on the Ajodhya Hills together with another on the "open spaces" of the Purulia district bring out sharply the major issues in the development of the dry western areas of the state. Particularly interesting is the story of a bridge constructed by the zilla parishad at a cost of Rs 7 lakh, where the minimum estimate of the PWD had been Rs 30 lakh. The villagers worked "10, 12, or more hours per day on a daily remuneration of Rs 4.50 plus 1 kg of rice". But even then the basic failures emerge. The bridge is ready, but the approach road is still to be built.

One of the most valuable parts of the book is the three chapters on the Sunderbans. The description of the landscape is masterly, but there are problems. Sugar beet was grown, but there was no market. Sunflower seeds were produced, but there was no arrangement for crushing the seeds. Nimpith and the neighbouring areas generated hope. On the other hand, the illegal use of saline water in the rice fields for growing prawns has converted good paddy soil into fisheries. Hope is transformed into dejection. "The more one sees of the people living in the Sunderbans", Ghosh says, "the more depressed one gets. There is of course a run-

ning battle against nature, in regard to erosion, in regard to salinity. But in the battle against salinity, it is also man against man, the poor farmer against the *bheri* owner". The concluding observation is telling! "There is also the apathy of the authorities in regard to the living and working conditions of the people in general, even when a Marxist political party is in power". Sunderbans is another world, though only about 50 miles from Calcutta.

One can go on like this, drawing out cameos, vignettes and acute observations about other districts. The reviewer feels tempted to give long quotations, which alone can bring to the reader the enchanting presentation of the economics of rural development, with the lights and shades all in soft but clear focus. He has, however, to remain content simply by stating that there are perceptive chapters on Nadia and Murshidabad (the 'Midlands' of West Bengal—with the 'command area' programmes); on the 'Bankura model' (which despite a deal of touting, does not in fact exist at all in a concrete form); on Birbhum (with its uncoordinated government activities); and also Tripura, outside the state, (where there are large new buildings to house research that is simply not there).

The epilogue which seeks to round off the study starts by saying that in 1987 "there appears to be a dangerous increase in the Writers Buildings of the spirit of Tennyson's 'lotus-eaters' ", a "general *ennui* in administration". At the same time, irresponsible implementation at the locations and routine-bound administration at the top have combined to take the sense out of decentralised planning. "The puerile, backward-looking objections of a tired and blase civil service need to be swept aside." To Ghosh, the ground in West Bengal seems to be ready for "a bold, statesman-like visionary approach" and "only a visionary, left-oriented government can bring about the required changes". But he concludes by raising the pessimistic questions, "Will it? When will it?" Ghosh apparently knows the answers.

Since Ghosh's travel diary was written, there have been major developments. The central government has suddenly become interested in panchayati raj and has amended the Constitution to give it the power to legislate for the local bodies and to bypass the state government. The objectives announced are highly commendable, but the motives are suspect and the political propriety of establishing a direct link between the centre and the third tier of government is highly questionable. And at the same time, other employment generation programmes (NREP and RLEGP) have been merged with the newly introduced Jawahar Rozgar Yojana.

A piquant situation has been created. The centre is applying cleverly-chosen strategies to thrust its finger into the politically succulent rural pie. The state government can only adopt 'reaction strategies' to counter the political designs of the centre. The officials have their own strategies based mainly on their divided loyalties and personal interests. And there in the black umbrella of corruption shading everything. The zilla parishads are watching their pay-off matrix. A highly sophisticated game-theoretic model of the entire situation can be formulated. It will however take time for our young economists to initiate and complete this provocative exercise. In the meantime, will it be too much to hope that Ghosh will revisit rural West Bengal, once towards the end of the current year (when the politics of election and rural development will get intertwined) and again at the end of 1990 when the hurly-burly's done? The readers will be thankful to him for another enthralling account of the sentimental journey of a clear-headed economist. They will wait eagerly for the next volume which may have some such title as *West Bengal Landscape Revisited*, and will be made available, if necessary, as a paper-back, at a price that large numbers can pay.

Marx's Theory of History

Obituary or New Start?

Arun Bose

Some Problems of Marx's Theory of History by Ashok Rudra; Orient Longman, Calcutta, 1988; pp 76, Rs 25.

TO get the best out of this slim volume (of 70 pages) it is best to remember a few things about its scope, as well as about the scope of this review.

First, the book does *not* have anything to say on Marx's theory of human progress (or Progress, for short). On whether it can or should go on forever, or at least till some communist millennium is reached. On this issue, Rudra will only say, quoting Wallerstein, "progress is not inevitable—one has to fight for it" (p 62), and no more. In saying this, he rejects, of course, the view of many economists, explicitly articulated by the anti-Marxist Paul Samuelson some years ago that there are built-in mechanisms in the economic (i e, the capitalist) system by which any absolute scarcity of everything can be avoided indefinitely. He rejects, also, the more recently advanced argument by the friendly critic of Marx, W J Baumol's challenging conventional classification of some natural resources as being 'exhaustible'. However, though Rudra does find "Marx was wrong" when he occasionally referred to "determinate laws of motion [which] govern development" propelled by 'iron necessity' (p 60), he does not seem to find anything wrong in Marx's acceptance of "man's conquest of Nature" as the goal one must "fight for" (though he does not make his approval explicit). So a reader will be largely wasting his time if he looks for Rudra's discussion of these themes connected with Progress, urgently by the environmentalists and the Greens.

Second, as just noted, Rudra is on the side of those Marxists who reject 'economic' or 'technological' or any Hegelian or neo-Hegelian 'historical' extra-human "idea"-based determinism, or any non-Hegelian version of human 'superstructural' determinism: any *one* of these 'determinisms' or *all* of them together. Thus he is against any theory of 'multiple co-determination' of 'historical laws' operative "in the last analysis" as well as by 'iron necessity'. There are no 'Prime Mover(s)', alternatively called 'motive force', 'motor force', (p 61). Nor are there several such 'motor forces' operating in tandem. For Rudra *any* 'determinism' is tied hand and foot to the doctrines of 'causality'. It must be rejected because there are "no causal links... between... two successive modes in general... [this] needs to be openly admitted" (p 25). He reassures those Marxists for whom it is still an article of faith that Marx's theory of history was 'scientific'. "History can be scientific without having any laws. Not even all the physical sciences have got laws. There are laws in physics and chemistry but not (none *at all*?) in geology or botany" (p 60). (It is not clear whether he would press the argument which has sometimes been heard that even physics, after the 'correspondence principle', is not a law-governed universe based on causality. Perhaps he would, perhaps not.) It is hardly any use trying to find out whether Rudra's anti-determinism makes him reject any 'scientific interpretation of history'. He stoutly denies that it does.

Third, for Rudra in this work, history almost stops with capitalism. He notes several alternative interpretations of Marx's theory of history, where there is no mention of socialism (pp 12,13) in his summary references (perhaps because they, as well as he himself, took socialism for granted). Of course, he does note that Irfan Habib and Paul Sweezy (pp 22, 25) as well as the Soviet historians Vasilev and Stuchevsky (p 14) do refer to 'stages' or 'modes of production' of socialism or the 'transition from capitalism to socialism—as if they have not the slightest doubt that such transitions *have* occurred 'historically', and in any case received attention in Marx's theory of history. But that is all. Anyone interested in discussing, for example, the strongly-held view of Immanuel Wallerstein that no 'transition from capitalism to socialism' has yet occurred in history, will find nothing at all on this issue. Perhaps because Rudra prefers to discuss these matters separately elsewhere, unless he rejects the view that one can study "the present as history" altogether. What is absolutely clear is that he does *not* take the 'historical' tran-

sitions since 1917 from capitalism to socialism as the *only* period in which Marx's theory of history can be, and has been, verified as correct (as the British historian Victor Kiernan, ignored by Rudra, has stated in a Marx centenary volume, and as Sweezy seems to make the bench-mark for assessing the debate on the transition from feudalism to capitalism in Europe, noted by Rudra on p 25).

Given this delimitation of the scope of the study to exclude socialism, there is no mention, naturally, of a question which has been posed since the 1930s, and has become tragically urgent in the 1980s. This is the possibility (or reality) of the 'reverse transition', by a 'revolution from above', of socialism to capitalism, as a problem of Marx's theory of history.

Fourth, Rudra's 'anti-determinism' has nothing to do with the 'anti-historicist' thesis which insists that every event in history is unique and cannot be compared or contrasted with identical or even similar events occurring over time or space. This is Karl Popper's thesis much controverted by Marxists in the 1950s, but which was explicitly endorsed at one time by the late Marx-influenced Joan Robinson who insisted that "the past is completely determined, and the future is completely uncertain", so that no determinate laws, if there are any, which can be discovered about the past, provide a reasonable basis for action to 'determine' the future.

All this falls outside the scope of Rudra's study, or refers to what he does *not* say. But a whole lot of themes do come within the scope of the study. Length-wise, there are more things Rudra has to say in rejecting other Marxists' interpretations of Marx's theory (and each other's interpretations) than in telling us what he puts in place of the interpretations rejected. But it seems to the reviewer that his alternatives are more novel and interesting than his rejections. So it is on these that he will concentrate. But here, too, there is a problem. To discuss in their full elaboration all these alternatives will take almost as many pages as the study itself. Moreover, there is every danger of the reader (and the reviewer too) getting lost in too many interesting details. So we focus on the inner core of Rudra's interpretation of Marx's theory of history, then express some doubts and suggest a few corrections and extensions. At the end we shall try to explain that his criticism of Marx and other Marxists whom he criticises seems to be overdone, since he himself notes that they agree with him on many salient points.

New Departures

In the innermost core of Rudra's re-interpretation of Marx's theory of history are some radically new departures.

First, as already noted, for Rudra there are no 'laws', 'hard' or 'soft', governing events and changes in history. Nevertheless, there is no vacuum, no absolutely unrepeatable, unique events. There *are* (limited chains of?) "regularities and similitudes which may be subjected to analytical comprehension" (p 61).

Second, these regularities or similitudes are *invariably* the product of mutual interaction between the 'productive forces', including in this demographic and geographical factors (p 62), the 'production relations' and the 'class struggle', in which the 'probability concept of conjuncture' (p 69), and perhaps also the state (pp 24, 31, 45, 59, and 69) play their role in varying degrees and in various ways.

Third, productive forces are plural sets, which can never be reduced to a prime mover (p 61). 'Production relations' too are sets with no one production relation being dominant. The class struggle also is seldom or never between any two classes (or even between the 'most exploited class' on one side and the 'exploiters' (one or more?) on the other) (pp 37, 53). As a result, when there is a dominating contention between any two classes (e g, between lords and serfs), it is the winner in another class struggle (e g, between the bourgeoisie and the nobility) who may come out on top (p 53).

Fourth, "the changing productive forces and production relations interact with no primacy or autonomy attached to either" (p 70). There is complete parity of importance between them as (if one dares to use a Rudra forbidden term) co-determinants. But *both* sets interact also with ideology, religion, and other 'cultural factors' (pp 52-53, 70) among which come in the ideology of caste (p 53). ('Other cultural factors' and 'religion' may or may not subsume, at least not entirely, formation of nationalities and nations, of which there is no mention.)

Fifth, the class struggle, too, is never everything, or a 'sufficient condition' (p 69). The degree, intensity of the struggle, and the "level of class consciousness", in turn influenced by ideological factors like Brahminic fatalism or the Protestant ethic, also matter (p 52).

Sixth, the class struggle has to do with "rapacious usurpation and extraction of surplus" by the exploiters. But it leads nowhere unless it is geared to 'innovation' of all kinds. Not only in 'production technology'. Also in surplus mobilisation through banks, equity shares and entrepreneurial activities by a special class consisting of "a new type of men, the [capitalist] entrepreneurs" (pp 68-69).

Doubts and Corrections

I accept, with some reservations, the challenging novelty of Rudra's new departures, and agree with them. Whether my reservations lead to major or minor corrections of either Rudra's understanding or my own will become clearer only if there is a discussion in which they are contested.

Rudra's own reasons for insisting upon dropping the standard Marxian formula "mode of production = productive forces + production relations" are not clear. I t
want its rejection. My reasons are that t
word 'production' on both sides of the ide
tity is restrictive and misleading. The s
called 'productive forces' consist of *bo*
labour and material resources involved n
only in 'production proper', as distinguish
from 'circulation' (i e, trade over both tin
and space) of commodities, but also in ci
culation which I believe, have been in the pi
ture since the dawn of the human specie
and cannot be wished away in any conceiv
ble form of human society. (To assume tha
mankind started with production *on*
without exchange and trade and can and wi
return to that state, is an impossibl
unnecessary and unproven flight of th
imagination, which Marx wrongly share
with his non-Marxian socialist predecessors
The so-called 'production relations' refer t
relations into which men enter to organis
not only 'production proper', but also a
economic activities connected with circula
tion and management of production and ci
culation. Consequently, I reject the term an
concept of "mode of production". I am no
willing to tolerate the formula even as a
euphemism for two reasons. First, if use
even as short hand for all kinds of economi
activities including production proper, ther
is the implication that 'production' is i
some sense *primary*, and others are secon
dary or even dispensable and their scop
should be minimised to 'set free' resource
available for 'production proper', even if they
cannot be wholly eliminated in the course
of 'human progress'. Second, it is absolutely
essential to fight what Rudra rightly attacks
as an 'anti-trade' bias (pp 65, 66, 68, 69)
which has been sanctioned even at the leve
of pure analysis by Engels in his notes or
Capital, volume 3.

I know that many, if not most, readers of this review (and Rudra's book) especially the historians among them, will probably react somewhat violently against what I say in the previous paragraph. They may insist on keeping the scope of Marx's theory of history within the limits of 'written history', and refuse point-blank to 'mix up' its issues with the anthropology or sociology of 'pre-historic' human society. Or they may cite inconclusive recently discovered evidence of "food-gatherers' communities" surviving in isolation in the contemporary world in support of Marx's notion of "primitive communities" where the only economic activity was production without exchange between 'direct producers', and 'production relations' were strictly and *literally* 'relations of production' in this sense. Or they may argue: even if there never have been such primitive communities in the *past* how can we dismiss such possibilities in the *future*? Don't modern scientists tell us that scientific possibilities are sure to be stranger than science fiction?

But suppose we limit the controversy to 'written history', as I am willing to limit it, if insisted upon. What do we do about the

suffocating anti-trade bias, which Rudra at least seems to take seriously enough to demand its elimination? For this reason, at any rate, I do not see how Rudra can insist on retaining the concepts and terms of standard Marxist 'productive forces' and 'production relations', but absolutely refuse to accept the standard Marxist 'mode of production' concept and term. If he argues that production itself interacts with and is conditioned by ideological, cultural factors, etc, then this is a reason for retaining the entire Marxist formula, but investing 'production' on both sides of the identity explicitly with this meaning (as Marx himself in his Preface to *A Contribution to a Critique of Political Economy* did). Only if Rudra insists on correcting biases like the anti-trade bias is there a case for dropping all references to 'production' from both sides of the formula, as the first step towards doing away with the rather narrowly restrictive and redundant concept of 'mode' in the popular Marxist formula, as I do.

For somewhat different reasons, I am also against Wallerstein's call for doing away altogether with the terms 'society' and 'social formation' on the ground of the 'ontological vacuity' of these terms which Rudra endorses as 'correct' (pp 20-21). First, although he prefers the terms 'world economy' and 'inter-states system' encompassing the world, Wallerstein insists that these terms refer only to the 'world capitalist' system. In his view the socialist countries represent only geographical segments of an integral world capitalism which are under the management of communist governments committed to the ultimate goal of socialism which can only be established on a world scale or not at all. If so, Wallerstein (and Rudra, if he agrees with him on this point) can have no objection, except a superficially semantic one, to references to the 'social formation of world capitalism'. Second, of course, there is the argument that most Marxists use the term 'social formation' as "simply a national or regional unit given to the writer rather than defined by him, thus no unit at all" (Perlin quoted by Rudra, p 19), with which, too, Wallerstein agrees. I do not agree that national or regional 'social formation' cannot be defined, and such concepts can only be inflicted on a reader at the passing whim of its author (though I strongly agree that this is often done, e g, in India or in China). My reasons are set out in my *India's Social Crisis* (Oxford University Press, Delhi, 1989), Chapters 2 and 3, with copious references to Wallerstein's arguments. There I show how national and regional social formations *can* be objectively defined with analytical precision.

My third disagreement is over the issue of *capitalist* underdevelopment. Of course, Rudra does have a theory of underdevelopment (in China, p 48, and in India, pp 42, 55, 57). For him 'lack of capitalism = lack of industrialisation = underdevelopment' (pp 55, 57). But the statistical record of 'development' in the period 1961-1981 compiled by the World Bank does *not* suggest that 'formerly underdeveloped countries' that have been industrialising (indexed by share of industry in GDP) have a high growth rate, while the low growth ones have not (Gerald Meier, *Leading Issues in Economic Development*, 1984, pp 152-53). Rudra may, of course, shoot down World Bank statistics as falsification of statistics. But the more general issue is whether capitalist development can promote either underdevelopment and long-term stagnation or development. Are both possible? I am convinced it can do either, so that to overcome capitalist underdevelopment capitalist industrialisation may *not* be the remedy. We may have capitalist industrialisation in India, but *still* have underdevelopment.

Criticism

Finally, I must make two points about Rudra's welcome criticisms of Marx and several Marxists. The more there is of such irreverent and uninhibited criticisms the better. It does not matter very much if some of it is overdone or is 'one-sided' (since underdone and misleading 'many-sided' or 'balanced' criticism has been the bane). But something is gained by trying to correct *ex post* such overdone or one-sided criticism.

Rudra's readers might get the impression that there is more disagreement between Rudra and Marx than there is, though Rudra himself may be fully aware of many more agreements than he found space to mention in a 70-page work whose main purpose was, rightly, to make Marxists think rather than to revere. To refer to one glaring omission, Marx has a great deal to say about the Christian Protestant ethic as a promoter of capitalist accumulation in North America in his *On the Jewish Question* (1844), sec ii, which is emphatically not as doctrinaire and superficial as Engels' references to Calvinism as a promoter of capitalism. Also, in Marx's recently reprinted *Notes on Indian History* there is a generalisation of the role of Indian Brahmins (contrasted to the role of Zoroastrian priests in Persia) which reinforces Rudra's point about the ideology of Brahminic fatalism, the philosophy of Karma, but enriches it. Readers of Rudra's text could profit by turning to these as follow-up reading.

Without being side-tracked in pinning down a wrong idea, Rudra seems to give 'the devil his due', albeit a little grudgingly, when his quarry started with a correct idea and then went astray (e g, Dobb in the Sweezy-Dob exchanges) or started with a wrong obsession and then blurted out what is true (e g, Hilton in the same controversy). But I must register a mild protest against Rudra's attribution to Wallerstein of the view that "the bourgeoisie *did not exist* or play any part independently. . ." (my italics) during the first and second industrial revolutions in Europe (p 37). I have read much by Wallerstein (including at least one article in the *Economic and Political Weekly*) where, if anything, Wallerstein somewhat overstresses the role of the nascent European bourgeoisie, not only from the sixteenth century but earlier. If there is anything by him which *denies* its role, it is an almost unknown Wallerstein writing.

Nationhood and the Nationalities in Pakistan

Hamza Alavi

Whereas in Europe nations were constituted into states, in post-colonial societies the problem is inverted—states have to be transformed into nations. This problem tends to be less acute where national liberation has been achieved through a long-drawn mass struggle, but the movement for Pakistan had a trajectory which did not include such a process. Political debate and conflict in Pakistan have revolved around the question: what is the legitimate place of sub-national aspirations and demands within a larger concept of Pakistani nationhood? The worst contradictions of the politics of ethnicity have been concentrated and have taken violent forms in Sindh.

MORE than four decades after the state of Pakistan was created it is still a country in search of an identity. That is not because the issue of our nationhood has not preoccupied our minds. To the contrary, it is one that we have been obsessed with. Much blood has been spilt just on that ground. Political debate and conflict has revolved around the question: What is the legitimate place of sub-national aspirations and demands within a larger concept of Pakistani nationhood. There is a tension and a dialectical opposition between these two levels of political identity, which has never been resolved, for those in power have tended to look upon sub-national movements as a threat to 'the nation' and subversive of national unity.

In the eyes of the articulate leadership of sub-national groups, the Pakistan 'nation' has been appropriated by Punjabis who dominate the ruling bureaucracy and the military that has effectively been in power in Pakistan since its inception; in partnership, they might say, until the mid-seventies with Muhajirs who were relatively well represented in the Punjabi dominated state apparatus. Members of the under-privileged regions have tended to see themselves as subject peoples who have not been given their rightful place in the nation. In their eyes, with a subtle inflection of meaning, the 'nation' is transmuted into 'country'. They exist within its boundaries and are subject to its laws and institutions. But the concept of 'country' is not evocative like that of the nation. It does not draw upon a deeply embedded sense of identification; it does not have the same emotive and legitimising charge. It does not give quite the same sense of belonging and commitment, as that of the nation. The peoples of Pakistan have not yet fused into a single community. The story of the Bengali movement, culminating in the liberation of Bangladesh, is a manifest example of this. Pakistan has yet to become what Benedict Anderson speaks of as the imagined community which, as he puts it, is "conceived as a deep horizontal comradeship" that cuts across boundaries and social groups and penetrates with varying degrees of consciousness, a great variety of social terrains [Anderson, 1983: 16].

'Official Nationalism'

Up to a point, it might be said that Pakistan is not alone among third world countries in this predicament; among countries where state power lies in the hands of one dominant ethnic group, alienating the rest. In Europe, where sub-national groups have also come forward in recent times with demands for autonomy and national self-determination, the historical perspective nevertheless has been rather different. There, by and large, national unification movements preceded formation of nation states so that the resulting states embraced peoples who, in the course of such movements, had developed a sense of common purpose and common identity that brought them together as nations. In post-colonial societies such processes, that weld peoples together, have tended to be rather tenuous. So it was, to a degree, in the case of the Pakistan movement. Whereas in Europe, nations were constituted into states, in post-colonial societies the problem is inverted: to transform states into nations.

This problem tends to be less acute where national liberation has been achieved through a long drawn mass struggle for independence and self-determination, which has brought peoples together to constitute nations, in their march towards a common destiny. The Pakistan movement has had a trajectory that has not included such a process. In any case the whole issue becomes more problematic where a single ethnic group finds itself in control of the state apparatus, through its disproportionate representation in the state bureaucracy and the military, as in Pakistan. There ruling military bureaucratic oligarchies, having appropriated state power, identify the state and the nation narrowly with their own particular purposes and interests.

If, in the circumstances, it were to be claimed that Pakistan is a unified nation that would be tantamount to what Anderson speaks of as "official nationalism", a national identity that is not spontaneously generated from below, but is imposed from above by those at the heart of the power structure in the country, in reaction to powerful sub-national movements that evoke a far more powerful popular response in a[ll] regions outside the Punjab. The nation, i[n] that context, is made into a property of th[e] privileged groups. Repression of sub-national movements by the ruling bureau-cracy and military, in the name of 'nationa[l] unity', in the circumstances, is self-defeatin[g] for that only deepens their sense of aliena-tion; their sense of being a subject people.

The Salariat

There is one class which has been centra[l] to this problem, both with regard to th[e] Pakistan movement as well as regional na-tionalism within Pakistan after indepen-dence. This is a section of the urban middle class, those with educational qualifications and aspirations for jobs in the state apparatus, the civil bureaucracy and the military. I have called it the *salariat* [Alavi, 1987]. This class has a particular salience in colonised societies with a predominantly agrarian production base where the colonial (and post-colonial) state apparatus has a dominating presence in the urban society and is the principal employer. Associated with the salariat are urban professionals, lawyers and doctors, as well as the intelligentsia, writers, poets, teachers and journalists, who share the life experiences and many of the aspirations of the 'salariat'. It is from amongst these that an articulate component of the political leadership is also drawn.

The Indian salariat, in its contemporary form, originated in the 19th century when the colonial regime made changes in the administrative and the legal system that was now to be worked by those who had received an anglo-vernacular education rather than a classical education in Persian, Arabic and Sanskrit. Those who acquired the requisite educational qualifications were recruited into the colonial state apparatus as clerks or bureaucrats. These 'westernised oriental gentlemen' as they were contemptuously referred to by British civil servants in India were to play a key role in shaping the style and direction of early Indian nationalist politics and they were at the centre, throughout, of the Pakistan movement.

The salariat is internally differentiated, for

those in its upper echelons, senior bureaucrats and military officers, hold positions of power. Their position is qualitatively different from that of lower level functionaries. But they share a common goal in a struggle for access to the limited opportunities for state employment. In that struggle the salariat has a tendency to divide and align along ethnic lines in order to draw wider support and solidarity in their struggle for a greater share of the available jobs as well as the limited places in institutions of higher education, the source of credentials for future jobs. Students, aspiring occupants of salariat positions, are therefore aligned with the respective salariat groups and play an active role in salariat politics.

India and Pakistan: The Differences

Lines of ethnic cleavages within the south Asian salariat are in large part a reflection of historical occupational specialisation in India by communities, as well as by uneven regional extension of the process of the colonial transformation of Indian society. Some communities have traditionally been associated with state employment. Under the several hundred years of Muslim rule, many Hindu communities nevertheless occupied a key role in the state apparatus, such as the Kayasthas and Kashmiri Brahmins in northern India or Amils in Sindh. It was much later that members of other communal, occupational, groups begn to be drawn towards salariat careers and it is not surprising therefore that they found themselves greatly under-represented in state employment.

The factor that influenced an uneven regional development of the salariat in India was early proximity to or distance from the nodal points of colonial rule in India which fanned out from its initial bases in Calcutta, Madras and Bombay and later Delhi. Those communities that were established in these places had an edge over those who were more distant and who had poorer access to the new educational institutions and salariat positions. This was affected too by the areas of concentration of missionary activity, a channel through which the new education was purveyed.

As far as Pakistan is concerned an important factor in the regional equation was the patronage bestowed by a grateful colonial regime on Punjabis for their help to the colonial regime in putting down the so-called 'Indian mutiny', the first Indian war of independence. Punjabis, whether Muslims, Sikhs or Hindus, were rewarded in many different ways, including land grants in the newly created canal colonies of the Punjab. But that included special attention to education. This was availed of by urban Punjabis who by virtue of being drawn into the salariat followed the political leadership of the Muslim League rather than the Unionist Party that was in power in the Punjab, the party of landowners of the Punjab, a multiethnic paty that defended landlord interests. Urban Punjabis, predominantly Urdu speakers, were both patronised and looked down upon by the ruling Unionists of the Punjab and their leaders like Sir Fazli Hussain, founder of the Unionist Party.

By contrast Bengali Muslims were much under-represented in salariat jobs, despite their relatively higher educational levels [Basu, 1974]. In Sindh the urban population before the partition was overwhelmingly Hindu, as indeed was the Sindhi salariat, the Amils. But Hindus were driven out of the country, following well organised rioting in Karachi in January 1948, leaving a social vacuum which was filled by incoming Urdu speaking Muhajir refugees from India. Sindhi Muslims were overwhelmingly rural and the Sindhi Muslim salariat element was very small at the time. Likewise the Baluch and Pathans were under-represented, although the latter were well established in the military. The relatively well educated Urdu speaking Muslims of northern India were traditionally well established in salariat positions and after the partition these Muhajirs shared control over state power as junior partners of the dominant Punjabis. Given that source of patronage and support, Muhajirs were with the Punjabis in supporting the notion of an indivisible Pakistan nation. But their position was shattered by the weakening of bureaucratic power by Bhutto's administrative reforms, and decisively so by the Zia regime that followed. Against that background Muhajirs abandoned their earlier position and declared themselves to be another disadvantaged ethnic group—giving rise to a new movement, the Muhajir Qaumi Mahaz (MQM), the Muhajir National Front. Ethnic politics in Sindh have followed an uneven course because at one level the small and weak Sindhi speaking salariat in that province has found itself in direct competition at the local level with the Urdu speaking Muhajirs while at the national level they both find common ground by virtue of Punjabi domination from the centre.

While the salariat has been at the centre of ethnic politics in Pakistan, it does not stand alone in this. This applies in particular to sons of landowners or rich peasants for example, who can afford to put their sons through higher education so that they may move into salariat positions which has not been their traditional occupation. In such cases we can say that there is an *organic link* that ties the salariat with the classes from which they originate. Beyond direct organic bonds, by virtue of kinship, there are also other kinds of linkages that mobilise broader sections of society behind salariat politics that dominates our political life. This is particularly an effect of the pervasive role of government in our society and its personalised character. Linkages that create possibilities of personal access to the bureaucracy are much valued, sought after and cultivated. Persons who come within wider social networks that potentially provide such contacts and connections with actual and prospective members of the salariat, such as fellow villagers or even those who can invoke their shared ethnic identity, will tend to identify themselves as such and give their backing to the ethnic politics of the salariat. They have a stake in their installation in public office and their promotions to higher positions within the bureaucracy for they can then hope to invoke their mediation and help that would provide for them a point of fruitful access to the bureaucratic machine.

In the case of sub-national movements for regional autonomy, ambitious politicians are also drawn into the game of ethnic politics. Where they have little hope of gaining power at the centre, an alternative is to profit from possibilities of acquiring influential public office at a local or provincial level. They have a stake in the goal of greater provincial autonomy which would put greater power and more resources at their disposal. They resort to chauvinistic rhetoric as a powerful means of mobilising support when they have little else to offer to the common people. On the other hand, one can see the logic of the politics of members of privileged and dominant ethnic groups who hold key positions in the bureaucracy and the military, and thereby are in control of state power, who feel threatened by politics of ethnicity and denounce such political appeals as parochial and particularistic. They invoke instead appeals for loyalty to larger entities such as the 'Pakistan nation' or the 'brotherhood of Islam' in the name of which they try to delegitimise regional ethnic demands. They invoke an 'official nationalism'.

Finally, in considering the reasons for Pakistan politics being overshadowed by politics of ethnicity we must consider our long history of authoritarian government by a bureaucratic and military oligarchy, seen to be predominantly Punjabi. There have been few opportunities, therefore, for the common people to participate in democratic processes. They feel alienated from the political system with no sense of participation in it. Pakistan and India provide contrasting cases of this. In India the plurality of salariat groups in the higher reaches of government and the absence of dominance by any single one of them has necessitated a political system through which those who are in positions of power in the state are obliged to operate a process of negotiation with different sections, groups and regions of Indian society, in a wide variety of ways, in order to aggregate authority in their exercise of state power. Such processes of negotiation operate both within the ruling Congress Party and between the Congress and regionally powerful political parties. There is therefore a wider degree of participation in the process of government. In Pakistan, by contrast, there is the dominance of a single salariat group, the Punjabis, in the military and the bureaucracy and the tenuous character of democracy in the country, even when it has been allowed formally to exist. As a result there is an absence of

political negotiation under authoritarian rule, which has heightened the sense of alienation and exclusion of the under-privileged regional groups, who are made to feel as outsiders in their own country.

Salariat-Based National Movement

The salariat was at the heart of early Indian nationalism whose main slogan was not yet independence but rather 'Indianisation' of government service and 'self-government' within the empire. Under conditions of colonial rule the salariats from different parts of India were, initially, united in that common goal. Yet even at this early stage ethnic competition within the Indian salariat was beginning to make its appearance. The movement of the Muslim salariat that ultimately culminated in the formation of Pakistan was only one of several such movements. Others included the Scheduled Castes Federation, the Brahmin vs non-Brahmin movement in south India and the unsuccessful movement led by E V Ramaswamy Naicker, the *Periyar* (great sage) who gave a call for the formation of a separate state of *Dravidisthan*, a state of the non-Brahmin people of south India. Naicker supported the Pakistan movement and was given a seat on the platform at the Madras session of the Muslim League. Naicker's dream and also his failure to mobilise the different, putatively Dravidian, people of south India behind his Tamil-led movement illustrates very well the character and the limits of politics of the salariat. This limitation is reflected in the history of the Muslim League too. It did very badly in the elections of 1937 and, ironically, it was at its weakest in Muslim majority provinces of India. It was by virtue of certain special circumstances that surfaced when independence was in sight, that brought about a swing in political alignments of powerful landlord groups in the Muslim majority provinces, that the Muslim League was able to muster forces that lay behind the creation of Pakistan.

The heart of Muslim nationalism in India was in the UP and Bihar, Muslim minority provinces. Muslims there had held a lion's share of government jobs. But with the switch to an Anglo-vernacular system of education and changes in the colonial administrative and legal systems as well as the very rapid expansion in the size of the salariat in the latter half of the 19th century, parallel with the construction of a new colonial economy in India [cf Alavi, 1989], there was a relatively greater increase in the non-Muslim component of the salariat. Muslims saw themselves losing their pre-eminence. Their share in the highest ranks of government service declined from 64 per cent in 1857 to about 35 per cent in 1913. This was a remarkable *decline in privilege*, for Muslims were only about 13 per cent to 15 per cent of the total population of the UP in that period. Under the leadership of Sir Syed Ahmad Khan they demanded a parity in quotas for government jobs, arguing that Muslims made up in quality what they lacked in overall numbers! Aligarh and Lucknow were the main political bases of the Muslim salariat who hijacked the Muslim League as soon as it was founded [cf Alavi, 1987]. Jinnah, a leader of the Indian National Congress, was invited to joint them in 1913. It is component of the Muslin salariat that was later to come to Pakistan as *Muhajirs*.

In the Punjab the Muslim salariat was also quite sizeable, for about 32 per cent of those educated in English in the Punjab were Muslims, rather less than their share of the total population which was over 52 per cent (Census 1931). The Punjabi Muslim salariat joined that of the UP and Bihar in the Muslim national movement, declaring that they were under-represented by way of their proper share of government jobs. These relatively more advanced components of the Muslim salariat in India were the main base for the Pakistan movement. It was a very limited base.

The salariat based Indian national movement was able to extend its base both by virtue of getting the backing of the Indian national bourgeoisie, anxious to get the colonial regime off its back and also by virtue of politics of mass mobilisation inaugurated by Mahatma Gandhi which triggered off the active support of the subordinate classes behind the movement for independence. That was not the style of politics of the Muslim League leadership. Mass mobilisation being absent in this case, the requisite political weight was secured only when a deal was made by Jinnah with landlord leadership of the Muslim majority provinces, especially in the Punjab and Sindh. That secured, nominally at least, the adoption of the Muslim League label by right wing landlord dominated governments that were in power in those provinces and gave the Muslim League some kind of mandate on the basis of which it was able to secure the final result. But the Muslim League's dependence on landlords of Sindh and Punjab for securing its goals and its inability to mobilise the Muslim masses was to have far reaching consequences for the state of Pakistan.

Politics of ethnicity, based on the problems and aspirations of different salariat groups, have developed differently in India and Pakistan in two respects. Firstly ethnic movements in Pakistan have taken the form primarily of sub-nationalism, although a secondary theme of localised ethnic conflicts and competition has not been absent. In India, by contrast, politics of ethnicity have, by and large, been displaced on to local arenas, taking the form of communalism and inter-communal conflict over quotas for jobs and places in institutions of higher education that lead to salariat and professional careers.

Secondly, we find that in the case of Pakistan there has been a succession of ethnic definitions and re-definitions, according to changing contexts of ethnic politics. To begin with the salariat groups behind the Pakistan movement were defined and uni[fied] by a religious *ethnic* criterion nam[ely] 'Muslim'. Pakistan was not created, a[s] ideologically represented by some inter[ests] in Pakistan today, to create an 'Islamic' s[tate] [cf Alavi, 1987]. The Pakistan Mus[lim] League was held to be the champion [of] *Muslim* nationalism. But the social roots [of] Muslim nationalism were quite shallow[. It] is quite remarkable that the Pakistan mo[ve]ment was at its weakest in Muslim majo[rity] provinces. As has been pointed out politi[cal] power in the Punjab lay in the hands no[t of] the Punjabi salariat but, rather, in the ha[nds] of powerful landowners who were organi[sed] behind the right wing landlord party, [the] Unionist Party, the party of Hindu and Si[kh] as well as Muslim landowners who despis[ed] the urban salariat groups even when th[ey] patronised them.

In Sindh the pattern was virtually ide[n]tical except for the fact that an ethnic Sind[hi] speaking Muslims salariat was virtual[ly] non-existent. Muslim in Sindh were eith[er] landlords or peasants, the *waderas* and *har[is]*. Sindhi urban society was overwhelming[ly] Hindu, except for a certain number of no[n-]Sindhi Muslims who had migrated to citi[es] of Sindh in the wake of colonial develo[p]ment. It is only in relatively recent times th[at] Sindhi speaking Muslims, who were pr[e]dominantly rural, have begun to come fo[r]ward to claim their share of salariat pos[i]tions. Muslims of Baluchistan were likewi[se] backward as also those of Sarhad, althoug[h] some sub-regional variations existed. I[n] these regions the Muslim League was to b[e] at the mercy of landlords and tribal leader[s].

The claim of Muslim nationalism in Indi[a] was that Indians were divided into two na[]tions, the Hindu nation and the Muslim na[]tion. The moment that Pakistan was esta[]blished Muslim nationalism had fulfilled it[s] objective and had outlived its original pur[]pose. There were two interesting response[s] to this new situation. Firstly Jinnah himsel[f] buried the two-nation theory in his inaugura[l] speech given on August 14, 1947 to the newl[y] established constituent assembly o[f] Pakistan. In that historic speech he declare[d] in the clearest possible terms his commit[]ment to the idea of secular citizenship i[n] Pakistan. From the principal forum of th[e] new state he declared:

> You may belong to any religion or creed[.] That has nothing to do with the business o[f] the state... We are starting with this fun[]damental principle, that we are all citizen[s] of one state... I think we should keep tha[t] in front of us as our idea and you will fin[d] that in course of time Hindus will cease t[o] be Hindus and Muslims will cease to be Muslims, not in the religious sense becaus[e] that is the personal faith of each individua[l] but in the political sense, as citizens of the state [Choudhury, 1967: 21-22].

Jinnah's speech was a clear declaration of secular citizenship in the new state, a speech that ideological vested interests in Pakistan have a hard time explaining away.

ASSERTION OF REGIONAL IDENTITIES

A rather different response to the creation of Pakistan was the affirmation of their own regional identities, as against the common identity of 'Muslim', by under-privileged regional salariat groups in Pakistan *vis-a-vis* the dominant Punjabis. There was a fresh reckoning of the distribution of privilege and deprivation. Virtually overnight there were ethnic re-definitions. The salariat groups of East Bengal, Sindh, Sarhad and Baluchistan promptly re-defined their identities as Bengalis, Sindhis, Pathans and Baluch and demanded fairer shares for themselves in jobs in the state apparatus. The respective regional, sub-nationalist, movements exploded into view the day after Pakistan came into being. The state of Pakistan was now represented by them as an instrument of Punjabi domination, with their control of the bureaucracy first under secretary-general Choudhry Muhammed Ali and later under governor Ghulam Mohammed. The fact that neither general Iskandar Mirza nor general Ayub Khan, who held the reins of power after them were Punjabis made little difference to that perception, for given the Punjabi positions within the bureaucracy and the military power was seen to be securely in Punjabi hands.

The articulation of Bengali and Pathan identities, respectively, on the basis of both region and language, was relatively unproblematic. The first expression of the demands of the East Bengal salariat came when Shaikh Mujibur Rahman, as a young student leader, put the aspirations of the people of East Pakistan before Jinnah when he visited Dacca. The powerful Bengali language movement, symbolically so, for language is above all the instrument of the pen-pushing salariat, was triggered off by the announcement in 1952 that Urdu would be the national language of Pakistan. The Bengali movement demonstrated its power in the East Pakistan election of 1954 when the 'ruling' Muslim Party secured no more than 10 seats out of a total of 309. Here the Bengali salariat was far more effective in the political arena than the Muslim League had been in the 1937 elections. In 1937 the social base of the victorious Krishak Proja Party in Bengal was made up of rich peasants and *jotedars*, who demanded abolition of *zamindari*, to get rid of the overlords who dominated their lives. That objective was achieved by zamindari abolition in East Bengal in 1951. In the elections in East Bengal in 1954 and subsequently, the leading issues were salariat demands. The rich peasants and jotedars, whose sons made up the East Bengal salariat, were solidly with them. Hence their landslide victories. These were solid votes against 'Punjabi' domination.

The problem of ethnic identity is rather more complicated in Sindh and Baluchistan. In Sindh, especially, it is an explosive issue that has torn that province apart in violent conflict. In Baluchistan if cultural criteria were to be interpreted too rigidly, as differentiating criteria of ethnic groups, a number of separate groups can be demarcated namely Baluch proper, Brahuis (or Brohis), Lassis, Makranis and in the north-eastern districts Pushtuns who are Pathans rather than Baluch. The literature of Baluch nationalism repudiates angrily attempts to fragment them on the basis of such criteria. Instead they have produced historical accounts of convergent origins of these different sections of a single people, the Baluch. It is the dominant Punjabi ruling groups, they argue, who emphasise and try to exploit such differences to disrupt Baluch unity. The Baluch on the other hand resist such attempts to divide them and stridently proclaim their unity. The only exception that some of them are prepared to make is in the case of Pushtuns and they accept the idea of Pushtun areas of Baluchistan being amalgamated with the neighbouring Sarhad province. Affirmations of Baluch unity are directed against Punjabis and other outsiders who monopolise jobs and most profitable occupations in Baluchistan to the exclusion of the Baluch.

CASE OF SINDH

It is in Sindh that the worst contradictions of the politics of ethnicity in Pakistan are concentrated and they take violent forms. Sindh is truly a multi-ethnic province. In a sense it has always been so, for historically it has been inhabited by a substantial number of Baluchi speaking people who, although they may speak Baluchi at home, are nevertheless regarded as Sindhi; some of them are Sindhi nationalist leaders. Likewise, there are migrants from Cutch in India (business communities) who have lived in Sindh (mainly Karachi) for many generations and have played leadership roles in Sindhi politics. For example Mahmood Haroon, who is from such a background, was among prominent delegates at a conference organised at Sann, the home of G M Syed, when the Sindh National Alliance was founded in 1988. Feroz Ahmad, a militant Sindhi extremist, who is an Ismaili, also belongs to this category. Hence we can see that Sindhi identity is a mixture of many different elements, a product of historical evolution.

But a distinction *is* made in the case of those who have come to Sindh after the partition. They are not categorised as Sindhis although they have lived in Sindh for decades. These include Muhajirs speaking refugees from India who came in at the partition and also Punjabis and Pathans who have migrated to Pakistan since then. Forty years ago when a flood of refugees, uprooted from India poured into Pakistan (similar numbers of Hindu and Sikh refugees were uprooted from Pakistan areas and were driven over the border across to India), the Punjabi dominated ruling oligarchy ensured that refugees from East Punjab and in the main only those, were settled in West Punjab so that ethnically and linguistically Punjab remained homogeneous; only a handful of refugees from other parts of India found their way into that province. All refugees other than those from East Punjab, i e, mainly the Urdu speaking refugees from northern and central India, were settled in Sindh, although Punjab, being a much larger province, had a greater capacity to absorb these refugees and offer them a livelihood. With Sindhi Hindus, the predominant element of Sindhi urban population having been driven out and the influx of Muhajirs into Sindh, the ethnic composition of Sindh was radically altered.

Some of the Urdu speaking refugees from India who were funnelled into Sindh settled on the land. But the bulk of them took the place of urban Sindhi Hindus, either as traders or professionals in the big cities and small towns of Sindh. The Urdu speaking Muhajirs also initially provided the bulk of the urban working class in Sindh. Sindhi speaking urban population in Sindh thus became quite minute. Whereas before the partition Sindh's cities were predominantly non-Muslim now they are predominantly Urdu speakers. As Sindhis started coming up in salariat they found that they had not only to deal with Punjabi domination of the state apparatus but also to compete with the relatively more advanced Muhajirs. Although initially (after the partition) the population of Sindh's cities was overwhelmingly Muhajir in composition, their ethnic composition changed substantially with the influx of Pathan and Punjabi workers who provided additions to the working force for the growing industries.

As a result according to the 1981 Census only 52 per cent of the population of Sindh consisted of those whose first language was Sindhi. Urdu speakers were more than 22 per cent of the total. But they predominated in the urban areas of Sindh where they were reckoned to number over 50 per cent of the population. The Muhajir urban majority is less pronounced as one moves to smaller towns which, after all, are mere extensions of the rural society. But along with Punjabis and Pathans they are an overwhelming majority of the three major industrial cities, namely Karachi, Hyderabad and Sukkur.

In Karachi, the capital of Sindh, a metropolis of over 8 million people, 54.3 per cent of the population (in 1981) were urdu speakers, i e, mainly Muhajirs. 13.6 per cent were Punjabi speakers and 8.7 per cent Pushto speaking Pathans from the Sarhad. In that capital of Sindh, those whose first language was Sindhi numbered a mere 6.3 per cent. That is the grievance of Sindhi nationalists. They have become strangers in their own land. However, it might be said that the census figures probably underestimate, as some experts believe, the numbers of Pathans and Punjabis in Karachi, many of whom live in *katchi abadis* or shanty towns where there has been under-enumeration. An estimated 40 per cent of the population of the city live in these slums. By contrast Sindhis who live in Karachi

belong to the lower middle class and above, many of them being absentee landlords and their retinues. Likewise in the other major cities of Sindh, Hyderabad and Sukkur, native Sindhi speakers are in a very small minority.

A rather different kind of complication in the ethnic composition of Sindh arises from the influx of privileged groups from outside. These are mostly Punjabis. Large tracts of land in Sindh, brought under irrigation since independence, were allotted by the ruling bureaucratic military oligarchy to senior officers of the bureaucracy or the military or their relatives, rather than to Sindhis. These new landlords in Sindh tend mostly to be absentee landlords and they brought with them Punjabi tenants or labourers, whom they could better control and rely upon than local Sindhis. So this is a double deprivation, of lands as well as jobs. In urban areas too valuable land and property has been allotted to persons in these categories. Punjabis are taking over industries and large businesses also from the (mainly) Cutchi businessmen of Sindh. Because of proliferation of state controls of a variety of kind, over the operation especially of industrial enterprises, the established businessmen have found it increasingly more difficult to cope with them, the more so during the eleven years of Zia's military dictatorship when rule of law gave way to arbitrary decisions by military officers. As a result many of the traditional businessmen have retreated into trade and many have transferred their operations abroad. In their place a new class of Punjabi capitalists has taken shape. These are not just any Punjabis but rather they are close kinsmen of senior bureaucrats and military officers. Their kinship links play an important part in their ability to negotiate bureaucratic hurdles which the old established bourgeoisie found it difficult to negotiate. *Both* Sindhis and Muhajirs have found themselves pushed into the background and resent these developments.

Muhajir Politics

The ethnic orientation of both Sindhis and Muhajirs has undergone significant changes in recent years, dramatically so in the case of Muhajirs. At the time of the partition Muhajirs were well established in the bureaucracy, though not in the armed services which is estimated to be around 85 per cent Punjabis, most of the rest being Pathans (these are not confirmed or verifiable figures). It must be said, however, that there do exist a number, though a diminishing one, of very senior Muhajir officers and generals. general Mirza Aslam Baig, Zia's successor is, for example, a Muhajir. However, as the significant alignments in the military are those amongst Punjabi officers and generals, Muhajir officers do not represent a power base on their own. They are rather often the 'least evil' choice of powerful rival groups of Punjabi officers.

Muhajir presence in the bureaucracy was an important source of patronage for them. In the circumstances they identified politically with concepts of Pakistan nationhood and some even with Islamic ideology and opposed demands of regional ethnic groups. That ideology was in continuity with their political orientation in the past for, along with urban Punjabis, Muhajirs were the bulwark of Muslim Nationalism in India and provided many of the principal leaders of the Pakistan movement. In Pakistan they were largely non-political, for their linkages with the bureaucracy were personal and particularistic. Insofar as they were drawn into the political arena they tended to back Islamic ideological parties such as the Jamaat-i-Islami or the Jamiat-i-Ulama-i-Pakistan.

The bureaucracy, with its important Muhajir component, used to be presided over by the tightly organised CSP, the Civil Service of Pakistan, successor to the colonial ICS, the so-called 'Steel Frame' of colonial rule. For two and a half decades after independence, it was the senior partner in the bureaucratic-military oligarchy that ruled Pakistan [cf Alavi, 1983]. It was powerful enough to keep the military at bay even during the martial law regime of General Yahya Khan. The situation changed radically after Bhutto's administrative reforms, that broke its back and the bureaucracy ceased to be the powerful entity that it used to be. Ironically that opened the way for unrestrained military rule under General Zia for the one great barrier in the way of military hegemony was removed. With the collapse of bureaucratic power, it was also the case that the Muhajirs lost their patrons in the structure of state power which now passed into unchallenged Punjabi hands.

It took a little time for these changes to manifest their effects in Muhajir politics—although it must not be forgotten that Muhajirs played a big role in movements against Ayub Khan which led him to transfer the capital away from Karachi, the principal Muhajir centre. Soon Muhajirs were to abandon their pre-occupation with affirmations of Pakistani nationhood and they abandoned, in the process, their support for Islamic fundamentalist parties. They lined up behind politics of ethnicity.

Hitherto Muhajirs had agitated against the quota system for jobs and admissions into institutions of higher education, which are at the core of ethnic politics. As late as December 1986 a Jamaat-i-Islami Urdu weekly, read mostly by Muhajirs, carried an article entitled: 'Quota System: Denial of Justice and the Sword of Oppression' (*Kota Sistam: Adal ki Nafi Aur Zulm ki Talwar* in *Takbeer*, December 24, 1986). But the Muhajirs were to change this stand. The quota system in Pakistan dates back to the 1950s when it was introduced in deference to East Bengali ethnic demands. Unlike the system in India where quotas are based on local communal criteria and are left to local authorities to work out and implement, in Pakistan they are regional, 10 per cent of the places being awarded 'on merit', 50 per cent for the Punjab, and 19 per cent for Sindh of which 11.4 per cent was for 'rural Sindh' and thus for predominantly Sindhi speakers and 7.6 per cent for urban Sindh, mainly Muhajir. A quota of 11.5 per cent was fixed for Sarhad and 3.5 per cent for Baluchistan and the rest for Azad Kashmir and Federally Administered Territories. However, there were problems with implementation of the quota system. Given Punjabi control over the administrative machinery, it has not been too difficult for a Punjabi to poach places from the other groups by obtaining false 'Certificates of Domicile' in say Quetta in Baluchistan or Hyderabad in Sindh, depriving the locals.

With the total collapse of bureaucratic power and consolidation of the power of the Punjabi dominated army, Muhajirs began to feel that they were losing ground heavily and their bureaucratic patrons were no longer able to help them quite as much as before. They had little to gain, they felt, from agitating for abolition of the quota system. In March 1984 a new movement, called the Muhajir Qaumi Mahaz (MQM), i e, the Muhajir National Front, was set up, its main impetus deriving from a Muhajir students' organisation. They now demanded that Muhajirs be recognised as the fifth nationality of Pakistan and that they should be allotted a 20 per cent quota at the centre and between 50 per cent and 60 per cent in Sindh. They also want it to be ensured that quotas in Sindh reserved for Sindhi speakers and Muhajirs, respectively, are not poached by Punjabis. The MQM took the urban centres of Sindh by storm.

Emergence of MQM

The MQM has emerged through the 1988 elections as the third largest party in the country—one might even say that in effect it is the second largest, for the Islamic Democratic Alliance, reckoned second, it itself no more than a precarious patchwork of 9 parties, cobbled together under pressure from above, to present a viable opposition to the PPP. The MQM was founded in March 1984 by some Muhajir students' groups. Its rise as a major force on the national scene was quite dramatic. That was precipitated by certain events in September 1986 when a planned Muhajir protest march from Karachi to Hyderabad was stopped by the police at Sohrab Kot, the 'gateway' to Karachi and the participants beaten up. That was the catalytic moment in its subsequent meteoric progress.

The emergence of the MQM as a major political force was not merely a matter of Muhajirs getting organised as such. It marked a sea change in their political attitudes. So far Muhajirs had championed the cause of Pakistan nationhood and were a major support for extreme right wing Islamic fundamentalist parties such as the Jamaat-i-

Islami. But now the national identity was dropped. Only a few months earlier it would have been thought to be unbelievable that Muhajirs would rally behind a slogan that said: "We have not signed a contract to uphold Pakistan and Islam!" (*Ham nain Pakistan aur Islam ka theka nahin liya hai*). Having for decades declared quite militantly that their identity was Pakistani and Muslim and that they opposed all ethnic movements as communal, they now decided to pursue communal politics. Overnight there was an ethnic redefinition for now they declared themselves to be Muhajirs rather than Pakistanis. Instead of moving towards an end to communalism and to ethnic conflict, the rise of the MQM, in the face of strident Sindhi nationalism, further consolidated the hold of communalism in Pakistan politics.

Sindh politics, however, have been in a state of flux. In 1983 the Movement for Restoration of Democracy in Pakistan was to launch a nationwide protest against Zia. In the event, it was in Sindh that an exclusively Sindhi movement arose, with great fury and power. Based on Sindhi speakers, it turned out to be narrowly a rural movement for it failed to rally the urban population, mainly Muhajirs, because of its sectarian Sindhi slogans. Nevertheless it was a most powerful movement that stretched the repressive state apparatus to the limit in trying to contain it and put it down. Attempts were made by the Zia regime to turn that movement into communal rioting and there was plenty of evidence of *agents provocateurs* at work. The leadership of the Sindhi movement succeeded in securing the help of local level Muhajir leaders and prominent members of their community to stand with the Sindhis on their platforms in order to prevent their struggle against the central government from degenerating into an inter-communal conflict. That experience had some impact on the thinking of some sections of the Sindhi leadership, especially its more radical sections. They began to realise that their movement had failed because of their inability to rally the urban population without which no movement in Sindh could succeed; and that if they had managed to involve the Muhajirs, their movement would have been irresistible. They began to see that Muhajirs were a part of the peoples of Sindh, indeed a part of the Sindhi people.

An important and influential section of the Sindhi leadership began to redefine Sindhi identity. Historically Sindhi identity had always been rather problematic in that multi-ethnic province. Many people from other regions have settled in Sindh, such as the Baluch who still speak Baluch at home but are recognised as Sindhis—many Baluchis are in fact in positions of leadership in Sindh. There are also Cutchis in Sindh. Cutch is a bridge between Sindh and Gujarat (in India) and the Cutchi language is cognate with Sindhi. There are other groups of early migrants in Sindhi. That includes those who are (putatively) of Arab origin, the Syeds, who came with the Arab conqueror of Sindh in the eighth century AD, Mohammad bin Kassim. Amongst these would be counted G M Syed, the father of Sindhi nationalism.

Extending Sindhi Identity

In 1986 one found Sindhi leaders and intellectuals engaged in discussing criteria on the basis of which Sindhi identity might be redefined so as to include also Muhajirs who are now an integral part of the population of Sindh, whom they would like to carry with them in their struggle for provincial autonomy. One can recognise that achievement of greater provincial autonomy would benefit the rural Sindhi speakers more directly because of the rural bias in the political system and the franchise. If unity with Muhajirs brought them nearer to that goal, it is the Sindhi speakers who would stand to gain most, even if the benefits were to be shared with Muhajirs. Together they would get the dominant Punjabis off their backs. At that time many Sindhi leaders were keen to extend the concept of Sindhi identity, accordingly, although there were a chauvinistic few who campaigned vigorously against it. In the cse of at least one of these in the latter category, suspicions were voiced that he was an employee of the ubiquitous inter-services intelligence, the notorious ISI (which was reported by the London based *Financial Times* to have 1,00,000 persons working for it). Such a possibility is not at all unlikely and cannot be ruled out. It would have suited the interests of the Zia regime to generate conflict between Sindhis and Muhajirs and even now that would serve the purposes of those who would like to see a weak government in power even if it is a democratically elected one.

Sindhi leaders who favoured extending the concept of Sindhi identity, argued that being a Sindhi was not a matter of place of origin or one of language that one spoke. If that were so, how could the Baluch in Sindh be accepted by them for so long as fellow Sindhis and so many of them acknowledged and honoured as Sindhi leaders. They argued that the Baluch in Sindh were Sindhis because they had *roots* in Sindh. They would extend that principle to Muhajirs. Muhajirs, they argued, were uprooted 'by fate and the forces of history' from their own soil in India and deposited in Sindh. They had struck fresh roots in Sindh as the Baluch and the Cutchis had done before them. These Sindhi leaders and intellectuals repudiated quite forcefully the paternalistic designation of Muhajirs as 'new Sindhis', a term that was widely used in the past but which, implicitly, denies Muhajirs full status as Sindhis. They insisted that they are full Sindhis, without any qualification. Descent they said, was no criterion of ethnicity nor was it religion or language. It was a question of *roots*.

Applying that criterion of rootedness, to other groups in Sindh, they took the view that Punjabis in Sindh would not qualify for inclusion within the expanded notion of being Sindhi. These are mostly bureaucrats and members of the armed forces or their close relatives who have secured large grants of land from the government, and who have brought with them their retinue of Punjabi sharecroppers and labourers. These Punjabis, the Sindhi leaders and intellectuals argued have come to Sindh as conquerors and usurpers, on the strength of state power. They remain Punjabis for they have their roots in Punjab which is exploiting the resources of Sindh. They should therefore be expelled from Sindh and the land restored to Sindhi hands, the sons of the soil.

Such Sindhi ethnic redefinitions, impelled, by recognition of need for political realignments, are most interesting to see. It was likewise in the case of Muhajirs, responses to some degree to re-alignments to Sindhi positions, but also, and especially, to changes on the national scene. This included the change in the ethnic self-definition of Muhajirs and the dramatic rise of the MQM in the mid-1980s. The Muhajirs now abandoned their opposition to the very conception of sub-nationalities. Earlier Muhajirs had repudiated the idea of ethnic identity or nationality in favour of Pakistan nationhood and Islamic brotherhood for which such divisions were repugnant. The MQM demanded instead the recognition of Muhajirs as the fifth nationality of Pakistan and virtually overnight Muhajirs rallied around it overwhelmingly. The process of ethnic redefinition continued further. In the face of Sindhi moderation Muhajirs realising that their own future is tied up with the future of Sindh as a whole, which cannot be resolved except in company with Sindhi speakers, changed tack once again. More confident after their resounding success in the local elections of Spring of 1987, they reoriented their approach, to prepare the ground for closer political co-operation with Sindhi speakers. Now they declared that Muhajirs were not a nationality by themselves. They were only a sub-nationality within the larger Sindhi nationality, Sindhi speakers being the other sub-national group. *Together* they constituted Sindhi nationality. Given Sindhi reorientations too, for a time it looked not at all unlikely that the two would move closer in the political arena towards some kind of a United Front in order to win concessions from the centre. However, the political situation was to change once again, after the death of Zia and the elections of 1988. The self-definition of Muhajirs as a sub-nationality was therefore short-lived. With the new re-alignments, they reverted to their claim to be the fifth nationality of Pakistan.

Strands in Sindhi Leadership

Sindhi re-alignments were taking shape also. A conference was held in Sann, the home of G M Syed, the grand old man of Sindhi nationalism, where the Sindh National Alliance was founded. It was a very broad-based conference where delegates

comprised the whole political spectrum among Sindhi speakers. A central issue in the debate turned out to be the name of the alliance, whether it should be *Sindh* National Alliance or *Sindhi* National Alliance. The former would leave the door open for Muhajirs to be invited in, and several speakers suggested that they should be. The latter alternative was designed to close the doors on Muhajirs being brought into the Alliance at all. It is significant therefore that it was the former option that was adopted.

There are elements within the Sindhi leadership who have resorted to extreme chauvinistic rhetoric *vis-a-vis* Muhajirs. Some of them speak of 'Muhajir Separatism' which is both an absurd and also a mischievous notion. It is intended to arouse Sindhi fears that Sindh will be dismembered. This is nonsense because the cities in which Muhajirs predominate cannot be lifted out of their rural environment in order to constitute a Muhajiristan. Moreover, a very large proportion of Muhajirs do not live in the three large cities but are dispersed throughout Sindh in small rural towns where their livelihoods depend on their relationships with Sindhi speakers who predominate there. Indeed these Muhajirs, now in their third or even fourth generation in Sindh, have learnt Sindhi at school and have been undergoing a process of Sindhification. In the 1983 movement despite attempts to promote Sindhi-Muhajir riots, to split and disrupt the powerful Sindhi movement, Muhajirs and Sindhis stood united, a fact which does much credit to both the Sindhi and Muhajir local level leadership. But it is sad, in the circumstances, to find scholars such as Feroze Ahmed fanning the fires of Sindhi chauvinism and progressive journals publishing such material.

On the other hand there are Sindhi leaders whose eyes are focused on the problem of getting the authoritarian hand of the central government off their backs and to win a greater degree of regional autonomy for Sindh. These more pragmatic leaders of Sindhi speakers cannot be unaware of the fact that, given the rural bias in our political system, it is they rather than the Muhajirs, who would predominate in the government of Sindh, as is the case at present. They have nothing to lose by an alliance with Muhajirs and indeed much to gain *vis-a-vis* the centre.

Motives of leaders of Sindhi speakers who resort to an extreme chauvinistic rhetoric and violent anti-Muhajir slogans must remain much more suspect. In the case of many of them, leaders whose political fortunes have waned, this strategy of outbidding more 'moderate' leadership by extreme slogans would, hopefully for them, revive discredited political fortunes and foster personal political ambitions. There is at least one Sindhi chauvinistic leader who is preaching what is tantamount to fascism. He has been demanding that all those who are not native Sindhi speakers should be expelled from Sindh. In the case of non-Sindhi industrial workers he declares: 'Let them take their industries with them. We do not want them here.' Likewise, he demands that Muhajirs should be expelled from Sindh. When asked where they might go—for by now we have third and fourth generation Muhajirs who know no other home than where they are—this leader replies that this should be no concern of his or the Sindhi people. "Hand them over to the United Nations High Commissioner for Refugees. He should find some place for them somewhere in this world. That is his job." This is a variant of the 'final solution' of the Nazis. This mischievous and vicious campaign offers nothing concrete to the Sindhis. Those who know the political leaders who are conducting such a vicious campaign see the hand of the central government in this and are able to point out concrete examples of patronage and positions of very considerable profit that have been bestowed on such individuals and their close relatives by a grateful central government for such campaigns directly benefit central power by causing disruption, divisions and conflict amongst the people of Sindh and undermine possibilities of united action on their part in the interest of the region as a whole.

LEFT'S NAIVETY

Paradoxically, objectively at any rate, the authoritarian centre is helped ideologically in this by groups on the Left, mainly in the Punjab, who tend to take utterly naive and quite misinformed positions *vis-a-vis* the Sindhi movements. They feel ideologically committed to the right of oppressed nationalities to national self-determination and regional autonomy. But when they look at Sindh, they see only the movement of Sindhi speakers as a legitimate movement. They have not yet overcome their suspicion of Muhajirs to recognise that they too are an oppressed nationality, standing side by side with Sindhis. Their suspicions of Muhajir politics are grounded in the fact that until the mid-eighties, Muhajir politics were hostile to the idea of natioinal self-determination in the name of Pakistani nationhood and Islamic unity. Muhajirs had supported central authoritarian rule and Islamic fundamentalism. When the MQM appeared on the scene they were taken unprepared for it and they have not yet figured out how to evaluate it. They have yet to come to terms with the sea change in Muhajir politics, their abandonment of Islamic fundamentalism and their emergence as a sub-national group whose claims, hardly less valid than those of Sindhi nationalism, need to be located justly and fairly within the overall picture.

At this point one might add that the ethnic problem in Sindh does not involve only the contending claims of the rival salariat groups, although that class has been at the core of ethr[illegible] politics. It concerns also a complex r[illegible]ure of ethnic groups that make up the industrial working class in Sindh, concentrated mainly in Karachi, Hyderabad and Sukkur. Ethnic divisions have been exploited to break up the unity of the industrial working class whereas in periods of militant working class action, as in the early 1970s, ethnic conflicts amongst workers has tended to recede into the background and lost from sight.

Industrial workers in Sindh are, almost entirely, non-Sindhis. Before independence, the working class in Karachi, engaged mainly in transport (railways, the docks and various forms of urban transport) were overwhelmingly Baluch (Makrani) migrant workers. Immediately after the partition, Muhajirs made up the bulk of the working class in Sindh's industrial cities Karachi, Hyderabad and Sukkur. As industrialisation progressed in the 1950s and 1960s, more workers were pulled in from densely populated agricultural regions of Sarhad and the Punjab (i e, its extreme north-western districts in the Potowar area) where farms were small and fragmented, incapable of providing a livelihood, so that traditionally there has been a 'push effect' forcing members of farm families to look for employment outside. In Sindh, by contrast, there was no such push effect so that members of farm families did not seek outside work and the working class in Sindh therefore was not recruited from the immediate hinterland. It is only in very recent years that farm mechanisation by Sindhi landlords is causing eviction of Sindhi sharecroppers, the *haris*, who are being forced to look for urban employment in a period of relative industrial stagnation.

Powerful vested interests are at work in Karachi which have generated ethnic conflict between working class ethnic groups, notably Pathans, against Muhajirs. Rioting has become endemic in Karachi and the people are terrorised by gangs equipped with automatic weapons, transported around in trucks. Some brilliant investigative journalists, especially those who have contributed to the monthly *Herald*, have exposed the hand of well organised drugs mafia and those engaged in trade in illegal arms and, not least, racketeers in urban land, who were behind these so-called ethnic riots. Karachi has large areas of vacant land around it, areas into which the rapidly expanding city has been pushing. Vacant land is seized by the racketeers, developed as housing projects and the houses sold at great profit to themselves. The city administration has been able to do nothing for it is itself under the control of the mafia. Given extraordinary levels of official corruption, the mafias also control the agencies of 'law and order', both the police and also the military at the local level. In the circumstances they have a relatively free hand. They do not tolerate any official projects that might interfere with their own very profitable operations. The organised violence of these mafias has sometimes been explained away as ethnic conflict that masks its real purposes on behalf of powerful interests. But once violence begins, inevitably, in the wake of such conflicts ethnic antagonisms escalate.

1988 Elections

More recently, in the context of the 1988 elections, some remarkable changes in alignments have taken place. Despite the powerful thrust of Sindhi nationalism, it was the PPP that got solid support from the Sindhi speaking part of Sindh's electorate. Those Sindhi nationalist candidates who insisted on standing in the elections were routed.

The PPP and notably its Sindhi leadership had consistently distanced itself from Sindhi nationalism. When approached by some chauvinistic Sindhi nationalist leaders in 1987, who invited the PPP to join them in sponsoring the Sindh National Alliance, the PPP Sindhi leaders spurned them saying that they were a 'national' party and could not therefore espouse regional causes. The PPP refused to align itself with particularistic Sindhi demands. The PPP also kept out of the Sindh National Alliance. There is an understandable logic in the PPP's anti-communal position. If it was to come to power at the centre, it had to carry the electorate of the Punjab. Punjab was hostile to regionalist movements that challenged Punjabi domination.

Despite that consistent position of the PPP leadership, already in 1986 there were clear indications that if general elections were to be held, Sindhi votes would go to the PPP. In my discussions with Sindhi intellectuals and Sindhi nationalist leaders in 1986 in Hyderabad, they all put it in somewhat emotive language legitimising their decision to abandon, temporarily at least, their Sindhi nationalist cause. They said that "We have a debt of blood to discharge. Therefore this time it will be the turn of the daughter of Zulfiqar Ali Bhutto. Our turn will come the next time." Bhutto had given his life for them, they said. That debt must be repaid by voting for his daughter.

Behind that ideological justification for their electoral tactics, practical reasons for taking such a course were quite evident. Sindhi nationalists could have no hope of forming a government at the centre and without that nothing would be delivered. Voting for Sindhi nationalist candidates would therefore be an empty gesture. On the other hand Sindhi leaders occupied powerful positions in the PPP, not least Benazir Bhutto herself. Even if in deference to her 'national' position she would not go quite so far as they might wish, it would not be unreasonable, they thought, to expect that she would go some little way at least to redress Sindhi grievances.

Ethnic strategies were re-assessed in the context of the 1988 elections. Despite the more florid rhetoric of some Sindhi nationalists, in the face of the consistent position of the PPP in distancing itself from them, Sindhis, nevertheless, voted solidly for the PPP. Those few Sindhi nationalist leaders who insisted on standing on a nationalist platform, faced ignominious defeat. Half a loaf was still something, as far as the Sindhi electorate was concerned. Just protest would achieve nothing. There are so far few signs that Sindhi nationalists will get even the few concessions that they hoped for and their disaffection is already making itself felt.

Defeated and discredited Sindhi nationalist leaders are using this to try and stage a come back. Their rhetoric has taken on a more chauvinistic tone. A wave of rioting has been sweeping through the cities of Sindh, following attacks by motorised armed gangs, equipped by automatic weapons, who have driven, with impunity, through wards of cities of Sindh, killing indiscriminately. As the history of communalism in the subcontinent has shown, once such violence is unleashed, it becomes self-generating and communal riots escalate with mutual reprisals.

Against such a background of inter-communal tension and indeed bloody violence, a demonstration was organised in Karachi in the name of the Sindh National Alliance, "the first big demonstration of its kind", as was reported (*Jang Daily*, April 3, 1989). This would not be quite true, for in 1987 an even bigger demonstration, in the form of a Peace March, was organised in Karachi, after some extremely vicious communal rioting. That demonstration and procession was led by leaders of all communities, Sindhi, Muhajir, Pathan and Punjabi, and to good effect.

Hopeful Sign

Be that as it may, the recent Sindh National Alliance demonstration was led by defeated and discredited right-wing leaders such as Hamida Khuro and Hafeezuddin Pirzada in company with ultra-chauvinists such as Rasool Bux Palejo. But it was addressed also by saner voices such as that of Abdul Wahid Aresar, chairman of the largest of the Sindhi nationalist parties, the Jiye Sindh Mahaz. The demonstration was organised against continued immigration and settlement of outsiders in Sindh but for the chauvinists it was clearly an anti-Muhajir event. On the other hand Aftab Meerani, a senior minister in the PPP-led Sindh government, declared that the demonstration was a conspiracy against the democratic government of the PPP.

The speech of Abdul Wahid Aresar, chairman of the Jiye Sindh Mahaz was in marked contrast to that of some of the others mentioned above. He said that just as the people of Sindh, while voting for the PPP on pragmatic grounds, nevertheless, could not be identified with the PPP, so also the fact that the Urdu speaking Muhajirs had voted solidly for the MQM did not mean that they did not have their differences with the MQM or that they should therefore be identified with that party. The fact that there had been an electoral polarisation did not mean that these two peoples of Sindh were therefore aligned against each other in rival camps. He continued that political conditions do not remain constant and fresh alignments would emerge. He appealed to both Sindhis and Muhajirs to stand shoulder to shoulder in their struggle to solve the collective problems of Sindh and he was confident that they would do so. The solution of problems of Sindh did not lie in rioting and conflict between Sindhi and Urdu speaking people of Sindh. It was a courageous speech in the context of attempts to arouse Sindhi chauvinistic feelings. What is significant is that this speech from the leader of the most important of the Sindhi nationalist parties (and groups) was received with enthusiasm. It is a hopeful sign for the future.

Roche Products

ROCHE PRODUCTS engaged in the manufacture of bulk drugs, drug intermediates, pharmaceutical specialities, food and feed supplements, wants to explore possibilities of export of software packages which can be suitably developed if the conditions are favourable. The proposed business can be combined conveniently and advantageously with the existing business of the company under existing circumstances. In future there may be other business opportunities also which the company may wish to explore.

The company has fared well during 1988 with sales rising from previous year's Rs 33.95 crore to Rs 43.11 crore and gross profit from Rs 2.24 crore to Rs 3.37 crore. Net profit is also higher at Rs 1.57 crore (Rs 1.12 crore). The directors have raised dividend by a point to 15 per cent which is covered 2.18 times by earnings as against 1.67 times previously. These good results have been achieved mainly due to the increased price of vitamin A prevailing throughout the year and the increased production of vitamin A from 49 to 59 MMU, an increase of 20 per cent. There have also been marginal price and volume increases in pharmaceutical specialities.

Exemption Limit and Personal Income Tax
An International Comparison

Pulin B Nayak
Pawan K Aggarwal

This paper analyses the relationship between the exemption limit in personal income tax and per capita income for a group of 26 selected countries. Two alternative kinds of exemption limit are examined, viz, the actual exemption limit and the notional exemption limit, where the latter is defined to be the income level at which the marginal rate of 25 per cent becomes applicable. Norms for both the actual and notional exemption limits are devised using a determinants analysis on the basis of per capita income and the share of personal income tax in total revenue. It is seen that the actual exemption limit and the marginal tax rates at low levels of income are high in India, Pakistan, Jamaica and Spain and low in the US and Thailand.

I

Introduction

THE exemption limit and the marginal tax schedule comprise the two basic elements of any income tax system. In most countries of the world personal income up to a certain limit is exempted from income tax. Two broad justifications may be provided to have income up to a certain level exempted from tax: (I) The capacity to pay income taxes may be regarded as being low for very low incomes. Individuals with low incomes up to a certain level may thus be exempted from paying tax. This may be thought of as being an *equity* argument. (ii) On grounds of administrative cost it might be advantageous to exempt a large number of taxpayers with very low tax liability if it is felt that the ratio of cost of collection to the tax yield for such persons would be so high as to make the imposition of the tax uneconomical. This may be thought of as being an *administrative* argument.

A natural question arises as to whether the exemption limit in a country is high or low as compared to the limit in other countries. It is well known that as the level of well-being of a country, judged in terms of, say, its per capita income, rises the share of direct taxes in total tax revenues is seen to be higher. With a per capita income of US $ 290, India raised about 18.96 per cent from direct taxes in the year 1986 whereas with per capita incomes of $ 8.870, $ 12,080 and $ 12,840 respectively. UK, West Germany and Japan raised 66.15, 76.49 and 74.79 per cent of their tax revenue from direct taxes. It should also be remembered that direct taxes can be more readily used as a tool to promote equity as compared to indirect taxes. The arguments for this are quite well known but for a systematic review of it the reader is referred to Musgrave and Musgrave [1980]. It may be expected that as the general level of well-being of a country rises an increasing proportion of the population may be, with good justification, brought within the income tax net. In particular, as per capita income rises the ratio (R) of the exemption limit to per capita income may be expected to fall. This also means that the ability- to-pay of the bulk of the population rises. Beyond the recognition of this fact, however, it ought to be stressed that any attempt at comparing the exemption limit across countries is in fact fraught with several methodological difficulties. Two countries may have the same per capita income levels, but the exemption limits of personal income taxes may well be different owing to, among others, three important factors: (i) The tax structures in the two countries in terms of the mix of the direct and indirect taxes may well be significantly different. This might well be so due to the different structural features of the two economies. (ii) The structure of personal income taxes itself may be significantly different between the two countries in the sense that different combinations of exemption limits and marginal tax schedules may be chosen to yield a target level of income tax revenues. (iii) The distributions of income in the two countries may be different, giving rise to the need for instituting different exemption limits in the two countries.

In this paper, however, we exclusively focus attention on per capita income and the mix of direct and indirect taxes as the key factors determining the level of the exemption limit.

A country with a large population size and high income inequality like India may adopt, *ceteris paribus,* a higher exemption limit as compared to other countries principally to avoid dealing with a large number of taxpayers for a meagre amount of tax revenue. From a perusal of the data for several countries it is observed that as per capita income rises the ratio R of the exemption limit to per capita income falls. Through a choice of suitable functional forms we relate R to per capita income and the share of personal income taxes in total tax revenue, and estimate the relationships. The actual R is then compared to its predicted value of R for individual countries. We also posit that those countries that raise a relatively larger amount of tax revenues from direct taxes would be having a lower exemption limit in relation to their per capita incomes for the sake of a wider tax base.

It has long been felt that inter-country per capita GDP data available, for example, the *World Development Report*, do n accurately reflect the real income lev across countries. In order to account for r income differentials not captured in t exchange rate adjustments Kravis and othe [1982] have proposed a set of correction fa tors to the per capita GDP figures. W attempt a second exercise linking the rat R to per capita incomes corrected by t Kravis index.

For our exercise we consider a sample o 26 countries. These are Austria, Brazi Colombia, Denmark, France, We Germany, India, Ireland, Italy, Jamaic Japan, Kenya, South Korea, Luxembour Malawi, Malaysia, Mexico, the Netherland Pakistan, Philippines, Spain, Sri Lank Thailand, UK, the US and Zambia. Th Kravis index is also available for all thes countries.

We also examine an alternative notion o exemption limit, which we call the 'notiona exemption limit'. This is taken to be the leve of income at which the marginal tax rate 2 per cent becomes applicable. Accordingly two exemption limit ratios, RA and RN could be defined which refer to the ratio of actual and notional exemption limits t per capita income. RN avoids the misleadin picture that we get from purely looking a RA for the countries that start with very lo exemption limits associated, perhaps, with very low marginal tax rates as in France West Germany, Luxembourg and the Nether lands. Both these notions provide differen kinds of information and it should not b thought that one is necessarily superior t the other.

We find that Colombia has the highes actual exemption limit ratio (RA), followe by India, Pakistan, Kenya and Sri Lanka, i the descending order. The US has the lowes RA which is followed, in the ascendin order, by South Korea, West Germany Austria and Luxembourg. On the othe hand, Malawi has the highest notiona exemption limit ratio (RN), followed in the descending order by Kenya, Pakistan and Thailand. West Germany has the lowest ratio which is followed, in the ascending order by Austria, UK and Luxembourg.

In the following section we present a brief review of the literature. In Section III a picture of the exemption limit and per capita incomes in various countries is presented. The fourth section of the paper outlines the methodology that we have adopted in this study. The results of our econometric exercise are presented in the fifth section. Since the exemption limit of the personal income tax is matter of much interest and relevance in India we focus specifically on the Indian case in Section VI. Section VII presents the conclusions of this study.

II
Exemption Limit: A Brief Review of the Literature

The literature on the comparative picture of personal income taxes across countries is meagre, presumably because of the inherent difficulties associated with attempting such an exercise. Some of the best known works in the area are due to Chelliah, Bass and Kelly [1975] and Tait, Gratz and Eichengreen [1979], both of which work out some measures of the average tax rate relative to the base. Dilnot and Morris [1984] in an important paper study the incomes tax structure of UK, and consider the consequences of choosing alternate tax scenarios but they do not provide a comparative picture of other countries. In the Indian context Chawla [1972], Gupta and Aggarwal [1982], and Kothari [1987], among many others, have considered the question of the exemption limit and the marginal tax schedule. None of these works, however, has considered the international picture.

Sicat and Virmani [1988] develop a methodology to compare marginal official tax rates across a sample of fifty developing countries. They caution against trying to link disincentive effects of a tax system purely in terms of the highest marginal rate. For their analysis they relate the income level which the tax reaches the highest marginal rate to per family GDP (FGDP), and examine the proportion of tax-payers to which the highest rates apply. The analysis is based on the above threshold income level and four other income levels (3/4 of mean FGDP, mean FGDP, 2 times FGDP and 3 times FGDP).

In analysing the impact of inflation on personal income tax in India, Bagchi [1982] argues that it is not the case that income tax has totally ignored the effects of inflation. In fact he shows that the exemption limit has moved up more than was necessary to neutralise the inflationary impact. He also looks at the ratio of the exemption limit to per capita income for 21 selected countries and finds that the ratio is the highest for India, followed by Pakistan, and lowest for Austria, West Germany and Israel. Bagchi also recognises that the exemption limit of personal income tax must depend upon the mix between direct and indirect taxes amongst countries.

III
Exemption Limit: Concepts Adopted and the International Picture

Table 1 presents data on both the actual and notional exemption limits along with per capita incomes of the sample countries. The data on exemption limits have been obtained from the *Investing Licensing and Trading Conditions Abroad* which have been compiled by the Business International Corporation, and the per capita income figures have been obtained from the *World Development Report (1987)*. The data on the exemption limits correspond to the year 1987 and the figures for the per capita gross domestic product (PCGDP) are for the year 1986. The latest year for which the Kravis index of real income comparisons of different countries is available with us is 1975 and the same have been used in the current study to make a correction for real PCGDP.

For the purpose of determining actual and notional exemption limits, we focus exclusively on the basic[1] exemption limit and the tax rate schedule applicable to a country. It is possible to think in terms of adding the standard deduction to the basic exemption limit to get an idea of the zero tax limit [see, for example, Sicat and Virmani (1988)]. We have resisted this temptation because in most countries the standard deduction is a variable with an upper limit and we see no obvious justification in merely adding on the upper limit of the standard deduction to the exemption limit. Moreover, the standard deduction is not applicable to income from all sources and is allowed only with respect to salary income in lieu of the expense of earning income just as deductions for expenses are allowed in computing profit or loss from business or other sources of income. Therefore, to the extent that the standard deduction represents the expense of earning salary income alone, it would not seem appropriate to add it to the basic exemption limit to cover all sources of income. Variation in the standard deduction across countries may thus be presumed to principally reflect variations in the expense of earning salary income.

It is of course true that income earners in different countries may have families of different average sizes to support but we make no adjustments to the exemption limit on this score. The picture would be further complicated by the fact that average family size would generally vary across income classes as well as across countries. Our analysis also does not take into account personal allowances specifically allowed for old age marriage, etc.

From Table 1 (Column 7), it would be noted that the ratio (RA) of actual exemption limit to per capita gross domestic product (PCGDP) in the country's own currency varies from as low as 0.1087 to as high as 5.0222 across the 26 countries covered here. Colombia has the highest RA which is followed in the descending order by India, Pakistan, Kenya, Sri Lanka, Denmark, Jamaica, Mexico and Malaysia. On the other hand, the US has the lowest RA which is followed, in the ascending order, by Korea, West Germany, Austria, Luxembourg, France and Italy. The ratio is found to decline as PCGDP rises across the countries as well as with rise in PCGDPA.[2]

It would also be noted from Table 1 (column 8) that the ratio (RN) of notional exemption limit to per capita gross domestic product varies from as low as 0.1729 to as high as 20.1494 across the countries. Malawi has the highest RN which is followed, in the decending order, by Kenya, Pakistan, Thailand, Philippines, Colombia and Malaysia. On the other hand, West Germany has the lowest RN which is followed, in the ascending order by Austria, the UK, Luxembourg, Ireland, France, and the Netherlands. As in the case of RA the ratio RN is also found to decline with increase in PCGDP across the countries as well as with increases in PCGDPA.

The rankings of different countries in terms of RA differ substantially from those in terms of RN (Table 1, columns 10 and 11). Colombia and India which are ranked first and second in terms of RA are found to be ranked sixth and ninth in terms of RN. On the other hand Malawi and Philippines which are ranked eleventh and twelfth in terms of RA are found to get respectively the first and fifth rankings in terms of RN. Similarly Korea and the US which are found to have the lowest exemption limit ratio RA are not found to have the lowest ratio RN—instead they are placed among countries with middle rankings.

The relationship between exemption limit ratios and per capita incomes is analysed subsequently.

IV
The Methodology

The ratio (R) of the exemption limit to per capita income can be expressed as a function of per capita income (PCI) and the ratio of personal income taxes (and social security contributions, wherever applicable) to the total tax revenue (ITR), as:

(1) $R = f(PCI, ITR)$

The higher the PCI of a country the lower is likely to be the exemption limit ratio (R). Countries relying more on direct taxes and specifically more on personal income taxes may adopt lower exemption limits to have a broad base of individuals' taxes. So the higher the ITR of a country it may be expected that the lower ought to be the exemption limit ratio (R).

For the purpose of studying the relationship of R with PCI and ITR, we have chosen the following alternative functional forms of relation (1):

(2) $R = \beta_1 PCI + \gamma_1 (1/PCI) + \delta_1 ITR$

(3) $LR = \beta_2 LPCI + \gamma_2 (1/PCI) + \delta_2 LITR$

(4) $LR = \beta_3 LPCI + \gamma_3 (1/LPCI) + \delta_3 LITR$

Where LR, LPCI and LITR denote the log values of R, PCI and ITR respectively. β_1, β_2, β_3, γ_1, γ_2, γ_3 and δ_1, δ_2 and δ_3 are the parameters to be estimated.

The expected values of β_1, β_2, β_3 δ_1, δ_2 and δ_3 are negative. γ_1, γ_2 and γ_3 can take any value. This is so because a country with a higher PCI is expected to have a lower R. Similarly a country that depends relatively more on individuals' taxes is also expected to register a lower R. The inverse term '1/PCI' or '1/LPCI' allows the relation between R and PCI to vary among the countries with respect to their level of economic development judged in terms of PCI.

In equation (2), for $\beta_1 < 0$, $\gamma_1 < 0$ would mean that the decline (rise) in R following a unit rise in PCI is higher (lower) among the countries with higher PCI, whereas for $\beta_1 < 0$, $\gamma_1 > 0$ would mean that the rate of decline in R following a unit rise in PCI is lower among the countries with higher PCI, and insignificance of γ_1 would mean that R falls by a constant value β_1 following a unit rise in PCI. A positive (negative) value of δ_1 would mean that R rises (falls) by a constant value δ_1 following a unit rise in ITR.[3] Equations (3) and (4) may be interpreted in a similar manner.

The per capita income (PCI) of different countries can be defined in at least two ways. The first and the obvious one would be in terms of US dollars at the official exchange rate. The second would be in terms of US dollars at the official exchange rate adjusted by the Kravis index for parity in purchasing power among different countries. The latter concept of PCI seems to be preferable to the former though several researchers have questioned the Kravis approach [see for example Isenman (1980)]. We have obtained the estimates of equations (2) to (4) by using both the concepts of PCI with a view of bringing out the implications of the above concepts.

As suggested above the exemption limit ratio (R), like PCI, is defined in two ways. The first is in terms of the ratio (RA) of actual exemption limit to per capita income. The second is in terms of the ratio (RN) of the notional exemption limit (taken to be the level of income at which the 25 per cent marginal rate of tax becomes applicable) to per capita income. Estimates of equations (2) to (4) are obtained by using both the concepts of R, i e, RA and RN.

The choice between equations (2) to (4) is dependent essentially on the econometric fit. The one which gives the statistically better fit is taken to be the preferred equation for our purposes. Different equations may be found to give better fits with different combinations of R and PCI, i e, RA and PCGDP, RA and PCGDPA, RN and PCGDP, and RN and PCGDPA.

Countries with exemption limits above or below a norm can be identified by comparing the estimated values of R obtained by using a preferred estimated equation with the actual values of R. Countries with the actual exemption limit ratio greater (lower) than the estimated value can be identified as those with exemption limits that are higher (lower) than the norm. Different countries can be ranked according to an index of deviation of actual value of R from its estimated value, which can be defined as:

$$(5)\ I = \frac{\text{actual R} - \text{estimated R}}{\text{actual R}}$$

This index may rank different countries in different ways depending on the concept of PCI (PCGDP or PCGDPA) and that of R (RA or RN) used in the estimated equations.

A positive (negative) value of the index I for a country would mean that the exemption limit in that country is greater (lower) than the norm. Values of I of 0.50 and 0.75 suggest that the actual exemption limit is respectively two-fold and four-fold as that of the norm. Similarly, values of I of −0.50, −1.00 and −2.00 suggest that the exemption limit is respectively two-thirds, half and one-third of the norm.

V

The Results

Each of equations (2) to (4) were estimated by ordinary least squares separately with each of the four combinations of R and PCI, i e, (RA, PCGDP), (RA, PCGDPA), (RN, PCGDP) and (RN, PCGDPA). In all these cases, equations (3) or (4) gave better fits as compared to equation (2) evaluated in terms of the explanatory power of the equations (R^2), significance of the coefficients of the exogenous variables

TABLE 2: PARAMETER ESTIMATES OF EQUATION OF ACTUAL EXEMPTION LIMIT RATIO (RA)

Note: Same as in Table 2 excepting that the dependent variable in the equations is log of notional exemption limit ratio (RN), i e, log RN.

and the standard error of the estimates. Parameter estimates of equations (3) and (4) are given in Tables 2 and 3. Parameter estimates of these equations with dependent variable as log RA are reported in Table 2 and those with dependent variable as log RN are reported in Table 3. The explanatory power of the equations with dependent variable log RN is substantially higher than those with dependent variable log RA. This is in fact what one would have expected. Our analysis suggests that some of the countries rather than opting for a higher exemption limit have settled for a low exemption limit with very low marginal rates of tax at initial levels of incomes. These are France, West Germany, Luxembourg and the Netherlands. The variation caused by this factor in RA could not be explained by the variables included in the functional specifications whereas RN is free from this variation and is thereby explained better by the variables included in the specifications.

It would be noted from Tables 2 and 3 that the coefficients of the logs of PCI and ITR are significant with all the four combinations of (R and PCI), except that the coefficient of log ITR is not significant with the combination (RA PCGDP). This seems to suggest that per capita income and the ratio of personal income tax to total taxes significantly affect the exemption limit ratio. The inverse of the log of PCI is significant only with the combination (RN, PCGDP) and the inverse of PCI is significant only with the combination (RA, PCGDPA). Depending on the explanatory power of the equations, the significance of the coefficients and the standard error of the estimates, the equation that gives the better fit differs with respect to different combinations of (R and PCI). For the combination (RA, PCGDP), equation 4 in Table 2 with the exclusion of the inverse of PCI and log ITR terms seems to give the better fit. With the combination (RA, PCGDPA), equation 6 in Table 2, with the inclusion of inverse of PCI and log ITR terms seems to give the better fit. With the combination (RN, PCGDP) equation 1 in Table 3, with the inclusion of the inverse of log PCI and log ITR terms seems to give the better fit. Lastly with the combination (RN, PCGDPA), equation 6 in Table 3, with the exclusion of the inverse of PCI but inclusion of log ITR seems to give the better fit. The expected signs of the coefficients of the explanatory variables are obtained in these equations. These better fit equations with different combinations of (R and PCI) are chosen for setting exemption limit ratio norms for different countries. Exemption limit ratio norms are thus given by estimated values of the ratio by using these better fit equations. Based on the actual and estimated values of the exemption limit ratio the index of deviation of the actual value of the exemption limit from its estimated value 'I' is calculated with respect to each of the four combinations of (R and PCI). The values of index I with the combinations (RA and PCGDP) and (PC, PCGDPA) are given in Table 4 and those with the combinations (RN and PCGDP) and (RN, PCGDPA) are reported in Table 5.

The values of index I, based on the combination (RA, PCGDPA) given in Table 4 (column 3), suggest that the actual exemption limit is greater than four-fold of the norm in Colombia and Denmark, greater than twice the norm in India and Spain, greater than one and a half times the norm in Kenya, Pakistan and Jamaica, around the norm in Mexico, Brazil, the UK, Ireland, Sri Lanka, the Netherlands, Malawi, Malaysia, Luxembourg, Japan and Italy less than two-thirds of the norm in Germany, Austria and the US, less than half the norm in Thailand, Philippines and Zambia and less than one-fifth of the norm in Korea. Implications of the values of the index, based on the combination (RA, PCGDP), i e, with unadjusted PCGDP, given in Table 4 (column 2), however, would have been slightly different from those stated above with the combination (RA, PCGDPA). The extent of excessive exemption limit would have been overestimated in Pakistan, Mexico and Sri Lanka and underestimated in Kenya and Spain. The extent of short-fall in the exemption limit would have been underestimated in Thailand, Philippines and Korea and overestimated in Malawi, Italy, the US, and Zambia. The policy applications of the above findings would seem to be that the exemption limit ought to be lowered in Colombia, Denmark, India, Jamaica, Kenya, Pakistan and Spain.

The value of index I, based on the combination (RN, PCGDPA), given in Table 5 (column 3), suggest that the notional exemption limit is greater than four-fold the norm in Colombia, greater than twice the norm in Malawi, Brazil and Japan, greater than one and a half the norm in Thailand, the US, Mexico, Kenya, Denmark and Malaysia, around the norm in Korea, Italy, Spain, Philippines, the Netherlands, Pakistan, France and Luxembourg, less than half the norm in India, Jamaica, Ireland, the UK, Austria and Sri Lanka, and less than one-third the norm in Zambia and West Germany. However, the implications of the values of the index based on the combination (RN, PCGDP), i e, with unadjusted PCGDP, given in Table 5 (column 2) would have been slightly different from those stated above based on (RN, PCGDPA). The extent of excessive exemption limit would have been overestimated in Thailand and Denmark, and underestimated in Colombia, Malaysia and Korea. Further, this would have placed Jamaica among the countries with exemption limit close to the norm instead of among those with exemption limit less than half the norm. An implication of the above findings is that the level of income at which the marginal rate of 25 per cent is applicable is high in Brazil, Colombia, Denmark, Japan, Kenya, Malaysia, Malawi, Mexico and the US, and low in Austria, Germany, India, Ireland, Jamaica, Sri Lanka, the UK, and Zambia.

A comparison of column (3) in Table 4 with that in Table 5 reveals substantial variation in the comparative picture of different countries based on the actual and notional exemption limit ratios. Countries such as India, Pakistan, and Jamaica which were found to have the exemption limit substantially higher than the norm based on the former ratio are found to have the exemption limit substantially lower than the norm based on the latter ratio. On the other hand, countries such as the US and Thailand which were found to have the exemption limit substantially lower than the norm based on the former ratio are found to have the limit substantially higher than the norm based on the latter ratio. This is attributable to the low minimum marginal rate of tax and low exemption limit in the latter category of countries as compared to the former category of countries. An implication of these findings is that in the former category of countries a lowering of the actual exemption limit should be accompanied by a simultaneous lowering of the marginal tax rates at low levels of income, and in the latter category, a raising of the exemption limit should be accompanied by a simultaneous raising of the marginal tax rates at low levels of income. For example, the exemption limit in India based on RA is greater than twice the norm but when judged in terms of RN it is less than half the norm. This suggests that the actual exemption limit in India should be reduced to half the present amount and simultaneously, the marginal tax rates at low income levels ought to be lowered such that the marginal rate of 25 per

TABLE 4: INDEX OF DEVIATION OF ACTUAL EXEMPTION LIMIT RATIO (RA) FROM THE NORM

Country	With RA and PCGDP	With RA and PCGDPA
Colombia	0.82	0.86
Denmark	0.86	0.81
India	0.63	0.61
Spain	0.37	0.54
Kenya	0.27	0.44
Pakistan	0.59	0.43
Jamaica	0.42	0.39
Mexico	0.41	0.26
Brazil	0.14	0.18
UK	0.14	0.18
Ireland	0.15	0.13
Sri Lanka	0.35	0.05
The Netherlands	−0.06	0.03
Malawi	−2.05	−0.09
Malaysia	0.30	−0.10
Luxembourg	−0.19	−0.17
Japan	−0.09	−0.17
Italy	−0.48	−0.26
France	−0.40	−0.35
West Germany	−0.71	−0.50
Austria	−0.60	−0.52
USA	−1.26	−0.69
Thailand	−0.82	−1.34
Philippines	−0.80	−1.52
Zambia	−3.39	−1.84
South Korea	−3.56	−4.69

cent becomes applicable at an income level above twice the current actual exemption limit. The exemption limit in the US based on RA is less than half the norm and the one based on RN is greater than one and a half times the norm.

Our analysis reveals that the exemption limit in Spain based on RA is greater than twice the norm and the one based on RN is close to the norm. This suggests that the actual exemption limit in Spain should perhaps be reduced to less than one half by carving out a low rate bracket from the current exemption limit so that the marginal rate of 25 per cent continues to be applicable at an income level as per the existing rate schedule. The exemption limit in Mexico and Brazil based on RA is around the norm and the one based on RN is around twice the norm. This implies that the marginal rate of 25 per cent is applicable at a relatively high level of income. The rate structure in these two countries need to be adjusted to raise the marginal rates at low income levels. The exemption limit in West Germany and Austria, based on RA, is around three-fourths of the norm and if based on RN is less than half the norm. This gives a signal for raising the exemption limit and lowering the tax rates at low income levels in these two countries.

VI

Exemption Limit in India

The exemption limit in India currently stands at Rs 18,000. In 1984-85 the limit was Rs 15,000. With each passing year there is clamour in several quarters for increasing the exemption limit, principally on the ground that inflation cuts into the real incomes of households and business firms. The consequences of inflation also eventually show up in upward wage revisions which leads to what is known as 'bracket creep', whereby tax payers move into higher tax brackets even though their real incomes may not have risen, or perhaps, even might have fallen. This will perhaps have some consequences for the notional exemption limit exercise we have carried out above. However, our presumption throughout has been that inflation would push up by a constant fraction both the per capita incomes on the one hand and the actual or notional exemption limit on the other.

Even so it might be useful to look at th exemption limit and the consumer price index (CPI) in India for some selected years from 1960-61.

Financial Year	Exemption Limit (Rs)	Consumer Price Index 1960=100
1960-61	3,000	100
1974-75	6,000	221
1975-76	8,000	270
1977-78	10,000	277
1980-81	12,000	330
1981-82	15,000	369
1986-87	18,000	568

It should be quite apparent that the exemption limit as well as the consumer price index have more or less moved up in tandem. For some years, e g, 1977-78 and 1981-82, the exemption limit appears to have been over-corrected *vis-a-vis* inflation, whereas for some other years, e g, 1986-87, the exemption limit appears to have been under-corrected.

The main burden of our analysis above suggests that with reference to an inter country comparison of per capita incomes the exemption limit is among the highest in the world. This conclusion is unaffected by inflation. However, the conclusion may well be affected by other significant features of the tax system, such as the share of direct to indirect taxes, the reliance on non-tax revenues and public borrowing, etc, and indeed it would also be affected by the structural features of the economy as a whole. The latter would include, among others, factors such as the level of development of the country, the share of agriculture, industry and the services in the national income,[4] the share of the export sector, etc.

When the analysis is carried out with respect to the notional exemption limit it emerges that India's exemption is, after all, not among the highest in the world. The starting marginal tax rate of 25 per cent appears too steep. There is perhaps a very good case for tempering the marginal tax rate applicable on the first slab. This could perhaps be set at around 15 per cent or so. There is however, no case whatsoever for increasing the exemption limit as such beyond the present level of Rs 18,000. Our analysis suggests that this level itself is very high, and in keeping with the international comparison t we have worked out, it should, if anythi be lowered. But we also realise that c templating any lowering of the exempt limit would perhaps be politically expedient. The limit should therefore allowed to stay put, with inflation be gradually allowed to reduce the real va of this sum.

This would also be in keeping with general thinking among tax theorists tod which seems to suggest that the base oug to be widened to bring one closer to notion of a comprehensive income tax a there ought to be a few tax slabs with t top rate not being too high. Seminal wo in the area of optimal income tax by M rlees [1971], Sheshinski [1972], Atkins [1973], Sadka [1976] and others seems to su gest that the top marginal tax rates oug not to be in excess of 40 per cent or so f a wide variety of specifications of incon profiles and individual utilities.

TABLE 5: INDEX OF DEVIATION OF ACTUAL EXEMPTION LIMIT OF RATIO (RN) FROM THE NORM

Country	With RN and PCGDP	With RN and PCGDPA
Colombia	0.45	0.78
Malawi	0.56	0.63
Brazil	0.50	0.62
Japan	0.55	0.50
Thailand	0.70	0.49
USA	0.54	0.49
Mexico	0.36	0.46
Kenya	0.47	0.46
Denmark	0.54	0.43
Malaysia	0.18	0.37
South Korea	0.11	0.32
Italy	0.16	0.13
Spain	0.05	0.12
Philippines	0.17	0.07
The Netherlands	0.09	−0.02
Pakistan	−0.12	−0.06
France	−0.23	−0.39
Luxembourg	−0.22	−0.44
India	−1.34	−1.07
Jamaica	0.08	−1.17
Ireland	−1.24	−1.26
UK	−1.16	−1.29
Austria	−1.27	−1.49
Sri Lanka	−2.09	−1.85
Zambia	−2.11	−2.44
West Germany	−2.25	−2.69

VII

Conclusions

Per capita income and the ratio of incom tax to total tax revenue seem to have significant effect on the ratio of exemptio limit to the per capita income of a countr

The actual exemption limit is found to b high in Colombia, Denmark, India Jamaica, Kenya, Pakistan and Spain, an low in Austria, Germany, Korea, Philippine Thailand, the US and Zambia.

The notional exemption limit, defined i terms of the level of income at which th marginal rate of 25 per cent is applicabl is found to be high in Brazil, Colombia Denmark, Japan, Kenya, Malaysia, Malawi Mexico and the US, and low in Austria, Wes Germany, India, Ireland, Jamaica, Sr Lanka, the UK and Zambia.

Our study suggests that the actual exemp tion limit and the marginal tax rates at lov levels of income should be lowered in India Pakistan, Jamaica and Spain and raised ir the US and Thailand. Signals are also noted for raising the exemption limit and lower ing the tax rates at low income levels ir Austria and Germany, and for raising the marginal tax rates at low levels of income in Brazil and Mexico.

Notes

[This research was carried out at the Direct Taxes Cell in the National Institute of Public Finance and Policy. Financial support by the Central Board of Direct Taxes to set up the Direct Taxes Cell is gratefully acknowledged. We have benefited from many discussions on the topic with Amaresh Bagchi. Thanks are also due to P Jhingon and Vijaya Devi for helpful comments on parts of this paper. However, we are solely responsible for any errors that might remain.]

1 This excludes deductions specifically allowed for dependent children or parents, marriage allowance, etc.

2 PCGDPA is PCGDP adjusted for purchas-

ing power parity by the Kravis index.

From equations (2) (3) and (4) we have:

$$\frac{dR}{dPCI} = \beta_1 - \frac{\gamma_1}{PCI^2} \quad \text{and} \quad \frac{dR}{dITR} = \delta_1 (2')$$

$$\frac{dR/R}{dPCI/PCI} = \beta_2 - \frac{\gamma_2}{PCI} \quad \text{and} \quad \frac{dR/R}{dITR/ITR} = \delta_2 (3')$$

$$\frac{dR/R}{dPCI/PCI} = \frac{\gamma_3}{LPCI^2} \quad \text{and} \quad \frac{dR/R}{dITR/ITR} = \delta_2 (4')$$

This factor is particularly crucial because countries such as India do not levy personal income taxes on agricultural income.

'Science' in Service of Monopolies
Universal Salt Iodisation Policy

K P Aravindan

The ubiquitous common salt, which once was the symbol of our struggle for national liberation, will soon be no more. The low cost crystal salt will be replaced by higher priced, fine iodised salt coming in sleek bags and carrying brand names made familiar by the electronic and other media. Another item of mass consumption is thus going to be fully integrated into the advanced capitalist market economy. The change-over will be effected by suitable legislation enacted by the government, buttressed by arguments put forth by a 'neutral, disinterested' scientific establishment. The monopoly sector of the Indian industry will chip in their might guided of course by the 'noble' pursuit of profit. Naturally, all of this will be done in the name of the poor, suffering millions, so that questioning it would be made to appear almost blasphemous.

The object of this article is to raise exactly a few of such blasphemous questions.

ENDEMIC goitre is enlargement of the thyroid gland, seen in a significant number of people in a population. This has been described in India from almost the vedic times. *Charakasamhita* and *Susrutasamhita* refer to neck swellings in what are most likely cases of goitre. It is known from the early part of the century that the inhabited valleys of the Himalayan massif is one of the world's largest contiguous areas of goitre prevalence[1].

The development of goitre or thyroid enlargement can be due to various factors. Undoubtedly, deficient intake of iodine is the most important of these causes. Iodine is necessary in minute quantities for the thyroid gland to synthesise its hormone thyroxine. This iodine is usually made available through the food and water. In areas where iodine is deficient in the water and soil, goitre incidence increases. In some other areas substances taken in the food can block the entry of iodine into the hormone. Such substances, called goitrogens are known to be a cause of endemic goitre either acting alone or in consonance with iodine deficiency.

It has been established beyond doubt that in the sub-Himalayan belt extending from Kashmir to Assam iodine deficiency is the cause of goitre[1]. The water and the food grown in the area is deficient in iodine and the people consume little or no fish and meat, which are rich sources of iodine, due to poverty and unavailability.

In such areas of the world various ways have been thought of, by which iodine can be supplemented in the diet. The most successful way this can be achieved is by iodising salt used for human and animal consumption. This is done by adding a specific amount of potassium iodide or iodate to the salt at the point of manufacture.

Apart from the cosmetic problem caused by a greatly enlarged thyroid gland, it is also found that in areas of high endemicity of goitre some children are born with gross mental retardation, deaf mutism and other physical abnormalities (cretinism). Prevention of this unfortunate disease is another important aim of salt iodisation[2].

Recognising the public health problem posed by the sub-Himalayan endemic goitre, the government of India initiated the National Goitre Control Programme in 1962. The modus operandi of this scheme was to (i) survey the suspected endemic areas, (ii) supply of iodised salt to the areas, (iii) prohibit the sale of non-iodised salt in those areas, and (iv) resurvey after periodic intervals to assess the impact of the programme. The government set up salt iodation plants in the public sector in Rajasthan, Gujarat, Assam, West Bengal and Himachal Pradesh. The state-owned 'Hindustan Salts' was given the sole monopoly for the production of iodated salt [3].

Despite these measures, the National Goitre Control Programme languished after a promising start. The 'sad story' of its mismanagement was sharply attacked by C Gopalan, the former director of ICMR [4]. This led to the setting up of a working group by the GOI to review the entire working of the National Goitre Control Programme. It is the acceptance of the suggestions made by the working group that led to the policy of 'universal iodisation of common salt' [3].

Strange Recommendations of Working Group

To any discerning observer the causes of failure of the programme in the endemic areas were obvious. The working group seems to have glossed over these entirely.

(1) The public sector units which were entrusted with the production of iodated salt were not able to produce the required amounts. The fact was accepted tamely without going into the reasons. The disinterest and lack of political will of the government is not seen as the most important factor. This was no doubt influenced by the urgings of the private salt manufacturers. The fact that this is not due to the innate inefficiency so often attributed to the public sector is borne out by the efficient functioning of the undertakings in which the government is really interested—look at the companies manufacturing condoms for the government's family planning project!

(2) The failure of health education campaigns to make the people in the endemic areas aware of the need to consume iodised salt. Such an education campaign relating to their daily life situation would have gone a long way towards the success of the programme. This lack of enthusiasm is again in striking contrast to the missionary zeal of the FP propaganda.

(3) Iodised salt was not made available in the endemic areas at the same or lower prices as compared to uniodised salt. This led to the smuggling and selling of cheaper non-iodised salt. There was no administrative willingness to check this. In the absence of a proper health campaign, people went in for the cheaper salt.

(4) Some of the salt sold as iodised was in fact not so at all. There were no proper quality control measures to detect this.

(5) Transport bottlenecks led to further non-availability in areas where it is most required.

The working group instead of studying the causes of this failure and giving suggestions for the streamlining of the existing production and distribution system, seems to have arrived at totally different and strange conclusions. It recommended that the only solution is to go in for universal iodisation. The reasons given were:

1 It was administratively difficult to prevent entry of non-iodised salt in the goitre endemic areas.
2 The problem of goitre and IDD was widely prevalent throughout the country and new endemic areas were frequently being identified.
3 The use of iodised salt by normal healthy individuals was not a health hazard.[3]

Increased production is sought to be achieved by throwing open the production of iodised salt to the private sector. As regards distribution and quality control, despite platitudes, the underlying hope seems to be that the market forces will take care of everything. As regards the second and third reasons, they seem to be put in as afterthoughts based on 'scientific evidence' so conveniently supplied.

The working group recommendations and the government policy announced shortly

thereafter is not based on a realistic assessment of the causes of earlier failure. To quote Gopalan, a supporter of the policy, "It will be a serious and naive miscalculation to expect that by just extending the salt iodation programme to cover the entire country, implementation will be simplified and current deficiencies will be automatically overcome"[5].

Socio-Economic Cost of Universal Iodisation

Fate of the small manufacturers: About 9 million tons of salt is produced in India annually. Except for negligible amounts it is mainly from sea water in the states of Gujarat, Tamil Nadu, Maharashtra and Andhra Pradesh. About 10,000 manufacturers are involved in this production. 50 per cent of the salt used for human consumption is produced by the small-scale manufacturers with fields less than 40 hectares in size[6].

The process of iodisation can be done in different ways. The spray mixing technology is the one favoured by the government and UNICEF. Moreover, only this technology can iodate salt in large quantities (5 tons per hour) and ensure uniform mixing of salt. Government of India has decided to supply potassium iodate free of cost to the manufacturers. But the experience so far has been that the delivery is not prompt[7].

The real problem for the small manufacturer is that an initial capital investment of 3-5 lakh rupees is needed for one spray mixing unit, which most of them are in no position to raise. Moreover for those with smaller fields (the vast majority) this technology is not cost effective. A further snag is that the manufacturers have to set up and maintain a quality control laboratory which adds to the initial and recurring expenditure. Newer regulations about packaging will also be disadvantageous for the small-scale sector.

To add to their woes is the competitive selling of iodised salt under different brand names. In the resultant free market warfare it will be a great wonder if the small-scale sector survives. In all likelihood the monopoly houses like Tatas who have now entered this field will make full use of the new policy to drive the small manufacturers out of business, with their shrill advertising and aggressive marketing.

Cost to the consumer: Common salt sells in most areas of the country at a price of approximately 50 ps per kg. The process of iodisation which involves extra expenditure tends to increase the price despite the subsidies. Apart from the capital costs involved there is a definite increase in the continuous operating costs. It is claimed that the minimum operating costs work out to about 11 paise per kilogram which is most probably an underestimate. Of this only about 2 paise per kg is subsidised by the government in the form of free supply of potassium iodate.

In actual fact the increase in prices would be out of proportion to the actual increase in expenses incurred. This is already seen in the market where iodised salt sells for prices ranging from Rs 1.50 to Rs 3 per kg. Only extreme naivette would permit the hope that this will come down in future. The very success of the current strategy depends on the co-operation of the private sector and it would be unrealistic to believe that they would be willing to forgo the current levels of profit in the industry. As for the capability of the government to force the private sector to bring down the prices, past experience in the different areas of industry should be an eloquent guide.

It is claimed that the costs of Rs 1.5 per kg and above is only that of refined iodated salt and that iodated crystal salt would sell cheaper as it already is in the endemic areas. But the whole point is that the new policy with its emphasis on private sector and reliance of the market will help the big manufacturers using the continuous spray mixing technology and sophisticated packaging to prevail over the others. It is feared that the crystal salt manufacturers (mostly small manufacturers and the public sector) will be pushed out of production. There would be an inexorable shift towards refined salt aided by the regulations and policies followed. UNICEF, the active partner of the GOI in the implementation of the programme, says in a document, "A lot of the salt in India is in crystal form. Historically consumers have bought only crystal salt. It is propsed that the common salt will be crushed before iodation. This would be achieved in a phased manner and consumer education will be undertaken to change consumer preferences"[6].

The final result would be that instead of salt now selling at 50 paise per kg, it would cost a minimum of Rs 1.5 per kg. This would cost the consumer a minimum of Rs 500 crore annually. In other words, the government would take Rs 500 crore from the poor citizen in whose name the policy is being pushed through and pass it on to the monopoly sector of Indian private industry.

Cost to the government: The government has committed an estimated Rs 210 million for the programme in the 7th Plan. A further Rs 125 million is the projected cost for the 8th Plan period excluding the recurrent costs of the staff, subsidy and other inputs. Furthermore all the iodine that is required for the programme would have to be imported and paid for in foreign exchange. It is only natural to ask whether this kind of expenditure would not have been more worthwhile if it was spent to make the already existing goitre control programme in the endemic areas a success.

Fate of the endemic areas: If the proposed increase in iodised salt manufacture does not keep up with the schedule, there is the real danger that the supply to endmic aeras will worsen. Previously the flow of iodised salt was from the production centres to the endemic areas. Now with the policy of universal iodisation, it would be easier and more profitable for the private manufacturers to sell the higher priced salt in the metropolitan and well developed markets. We may see a situation where people who really need the product do not get it while those who do not need it get a surfeit of the same. This situation already exists for several products like drugs.

Perhaps, anticipating this it has been recommended that in the interim period (i e till iodised salt manufacture attains necessary levels) the people in the endemic area be covered by injections of iodised oil[6]. But it has been pointed out that this would be prohibitively costly besides requiring large imports. Moreover, it is strange to suggest that areas which are 'inaccessible' to common salt would be easily accessible to periodic massive injection programmes![5].

'Scientific' Backbone of Universal Iodisation

The universal iodisation policy if pushed through as it is, will be done at tremendous social and economic cost. But the bitter pill would have to be swallowed willingly, had the scientific argument in its favour been so strong as to make it imperative. Faced with any criticism of its policy, the authorities would take cover behind the shield of 'learned scientific opinion'. It is worthwhile to examine how foolproof the scientific arguments in support of universal iodisation really are.

Virtually all the studies forming the basis of the new policy have been done by a handful of scientists—mostly in the All India Institute of Medical Sciences. The claim is that they have uncovered several new facts which challenge the conventional wisdom.

The conventional wisdom till the late seventies has been that a programme for the prevention of endemic goitre can be justified only in terms of health. If endemic goitre were merely a cosmetic problem there could be little justification for government action. However large nodular thyroids may cause obstructive symptoms and may be subject to malignant changes. In addition, when endemic goitre is severe, endemic cretinism is found also[9].

Leading from this the question was posed as to what level of endemic goitre or endemic cretinism justifies a prophylactic programme? Obviously the criteria accepted would vary according to the socio-economic situation of a country. Methods for grading goitres in surveys were developed whereby all goitres were graded on a scale from 0 to 4[10]. In general it was suggested that a 5 per cent incidence of Grade I goitre in pre- or peri-adolescent school children or a 30 per cent incidence of goitre in the general population would certainly warrant some action; the presence in the population of 1 per cent persons who could be classified as cretins would demand early and urgent action[9].

The bedrock of the new policy is the purported new evidence unearthed by studies

done in India. The main line of argument is more or less as follows:

1 Previously it was thought that an adaptively enlarged thyroid gland compensated for iodine deficiency by stretching its cpacity to put out enough thyroxine to meet bodily needs, i e, the patients are 'euthyroid' (thyroid function normal). It is now claimed that more than half the goitrous persons in the severely endemic areas were 'hypothyroid' or that they had thyroxine deficiency[11].

2 Sub-cretinous brain damage occurs in endemic populations in addition to overt cretinism[12]. The argument is that even in areas with no increase in the rate of cretinism children have sub-normal intelligence and this can be detected by IQ tests. The problem of mental retardation may be much more extensive than was inferred originally from the observation that only less than one percent of children in goitre endemic areas suffer from cretinism. New studies reveal that 15 per cent of children could be suffering from varying degrees of mental retardation[3].

3 The risk for such subnormal intelligence can be assessed by screening new-borns for thyroxine deficiency. By such methods, in the severe endemic areas, as much as one in six new-borns are found to be thyroxine deficient at birth.

4 Newer endemic areas in India are being found in surveys and the cause for endemic goitre in these areas is also iodine deficiency[11].

5 Prophylaxis of endemic goitre is best done by iodising salt. Excess intake of iodine will not be a problem given the current levels of intake in any part of India[11].

Each thread in this line of argument needs to be examined in detail.

Claim of Hypothyroidism in Himalayan Endemic Goitre

The most quoted study in support of this claim is one by Kochupillai et al published in 1973[13]. This article is cited often and with an air of finality to claim that as much as 60 per cent of the goitrous individuals are decompensated and subthyroid[14, 15].

In reality all that the study shows is that the mean levels of TSH hormone is increased in the 26 goitrous subjects studied when compared to controls in England. In fact the mean thyroxine (T4) levels were higher (significantly so in Grade I goitres) when compared to the same controls. In a classical example of doublespeak the authors try to dismiss this by saying that possibly it is due to the fact that the controls were from England! True, the authors find that the effective thyroxine available (represented by the values of ETR) is slightly reduced. But the most important point actually seen from the results but only cursorily discussed is the fact that the second type of thyroid hormone called T3 is significantly elevated in the subjects when compared to the controls.

Now what happens is that the thyroid enlarges in response to the increased secretion of the pituitary hormone TSH and makes more economical use of the iodine available by preferential secretion of tri-iodothyronine (T3) which is metabolically more active than thyroxine but contains less iodine (three atoms per molecule compared to four for thyroxine)[16, 17]. In these persons the normal function of thyroid is thus maintained.

There is a tendency among some endocrinologists to use the term 'subclinical hypothyroidism' in subjects with normal thyroxine and elevated TSH. But this is apparently a misnomer. To quote an eminent endocrinologist "I question the wisdom of referring to patients with normal circulating thyroid hormone, but elevated serum TSH values as suffering from 'subclinical hypothyroidism'. Hypothyroidism to my mind is a state in which there is inadequate supply of thyroid hormone to the tissues... I would prefer the term inadequate thyroid reserve in analogy to other endocrine axis"[18].

The misnomer becomes positively misleading when used in the lay press to whip up support for a policy as Kochupillai has done[11, 19].

Some other attempts to present the above quoted study as something of a landmark, again reveals a misleading propagandist streak out of place in a scientific article. For example it is said of the 1973 study, "this was indeed disturbing information and lead to an editorial comment in *Lancet* about 'Theory and Practice of Endemic Goitre'"[14]. A close reading of the said *Lancet* editorial[16] finds the work mentioned among many others. It was certainly not the sole inspiratron, nor was the main theme of the editorial the same.

Case for Subclinical Cretinism

In the mountainous terrain of the Himalayas there are pockets where endemic cretinism is seen in 1-4 per cent of the population. Even higher figures are reported from parts of Nepal[1]. But elsewhere in the sub-Himalayan endemic, the incidence is uniformly below 1 per cent[3]. In the supposedly new endemic areas being uncovered, endemic cretinism is not seen at all. But suppose iodine deficiency produces milder forms of mental retardation? (The so-called 'subclinical cretinism' *a la* subclinical hypothyroidism that we have just examined). It then becomes a powerful and emotive argument for ramming down the new policy (the unseen drain of brain power of our future generations, etc). So subclinical cretinism comes into the vocabulary and if it did not exist it had to be invented.

The methodology adopted for proving the new hypothesis involves developmental and intelligence testing. This approach is highly controversial and has been so riddled with a priori assumptions, conscious fraud and politics, that its very value and scientific objectivity has been seriously questioned[20, 21].

In one such study exactly 26 children goitrous mothers are compared with 20 co trols by using the Gessel developme score[22]. It is then concluded that t development quotient and language develo ment is lower in the children of the goitro mothers. The mean DQ for the controls 98.4 and that for others is 94.4. Using a co venient statistical test (t test) this has bee shown to be a significant difference and pr found conclusions drawn.

Apart from conscious fraud resorted by the likes of the grat Cyril Burt which p mental testing into much disrepute[23], the are unconscious and theoretical errors whic nullify its scientific value. One such 'reification' i e, belief that anything given name (like intelligence) is a thing and ca be measured on a metric scale, like heigh or weight and can further be used for com paring people. The fault in the logic in cas of intelligence and developmental tests ar clear. The fact that it is possible to devis tests on which individuals score arbitrar points does not mean that the quality bein measured by the test is really metric. Th illusion is provided by the scale. The ordina scale is an arbitrary one and most psycho metric tests measure ordinals of this sort. person with an IQ of 100 is not twice a intelligent as one with an IQ of 50[24]. Thu the statistical tests used to compare smal differences in scores are inappropriate.

A second criticism often levelled agains these tests is that strong a priori assumption alter the result even in the absence of fraud The tests do not represent the application of a neutral instrument, a test by an objective tester to a testee whose performance is being measured. Rather the results of a test are themselves the products of a three way interaction between the tester, the test and the testee. The tester's expectations of the testee's performance may itself modify that performance[25]. It is seen that black children score better on IQ tests administered by a black (or even by a computer!) than by a white[26]. This tester bias has led to such monumental errors as classifying the blacks and Asians as less intelligent than whites, women as less intelligent than men and so on[24].

Another important source for error is the socio-cultural bias of the tests themselves. In a country like India no single test may be appropriate for all the regions. Yet using such a test battery, children in Gonda have been branded less intelligent than those from the average Indian village[27]. This is a slipshod work to say the least. No controls seem to have been tested at all. Instead, the 'normal' values provided by the tests' designers have been taken. Performance in intelligence tests especially for those who score between 50 and 75 are strongly influenced by factors like material deprivation, poor educational facilities, family instability and lack of mental stimulation[28]. Yet we find here, supposedly serious scientists testing children from one of the poorest regions of India without even bothering to

set up a control and branding them as subnormal. And to add to the original errors they unquestioningly attribute the low scores to iodine deficiency without caring to look for the other socio-economic variables which could have given the same result.

The claim for sub-cretinous mental retardation is not supported by hard evidence. If indeed it is present in such high proportions it is indeed strange that it is not accompanied by a concomitant increase in clinical cretinism. The studies done by 'convinced' scientists using faulty and careless methods seem more like propaganda for their pet theme rather than real science.

As of now the following comment by Clements in 1960 seems to be still valid. "Mental deficiency without the other stigmata of cretinism has sometimes been considered to be a sequel of endemic goitre. Most of those who have made this claim have not had close association with endemic cretinism... Extensive investigations of mental defectives in non-goitrous areas have failed to show any connection between thyroid function and mental deficiency. There seems to be no justification for the statement that one of the sequelae of endemic goitre in the progeny is uncomplicated mental deficiency[35].

Neonatal Chemical Hypothyroidism

Proceeding from the assumption that milder forms of mental retardation due to iodine deficiency exists, neonatal screening for thyroid status was organised in selected areas to detect those at risk[15, 27]. The indigenous development of effective technology to accomplish this was a commendable effort. But the conclusions drawn from the studies are open to question.

In this study, the cord blood of newborns from the severe endemic areas were examined for T4 and TSH and compared with blood controls from Delhi and Kerala. Using standard criteria it was found that 7.5 per cent in Gonda and 13.3 per cent in Deoria were hypothyroid, while there was no significant neonatal chemical hypothyroidism in Delhi or Kerala[27].

It is known that in iodine deficient areas, some children may be born with what is called 'transient neonatal hypothyroidism'. This abnormality is characterised by low serum T4 and high TSH concentrations and spontaneously corrects itself over five to six weeks[29]. In Europe transient neonatal hypothyroidism has been related to iodine deficiency, since the incidence seems higher in regions of endemic goitre[30, 31]. In one series of Belgian newborns, the prevalence of transient hypothyroidism was 12 per cent[29]. Most cases occurred in the premature infants[32]. The prevalence was 26 per cent in infants under 32 weeks and about 5 per cent in term infants. Significant levels of transient neonatal hypothyroidism has been reported from Sicily[33].

In the studies quoted from India no attempts have been made to note the proportion of those with transient hypothyroidism. There is further no attempt even to quantitate the proportion of premature infants. Two of the articles published in 1984 are clear examples of evasion of the issue[14, 15]. Transient hypothyroidism is not even mentioned in the discussion. It is difficult to believe that the authors were unaware of the condition which has been described as early as 1978. Moreover, in one of the articles[15] the book containing a discussion on the subject is quoted in the bibliography in another context[30]. This is an example of the kind of intellectual dishonesty that is seen in much of the work on iodine deficiency goitre in India.

The problem of transient hypothyroidism is acknowledged in the discussion in a later paper by the same authors[27] (probably inserted after peer review). In it they admit that it could be important in iodine deficient areas but that they did not look for it because they considered it unethical to follow up these babies without treatment. Again it is unlikely that they were unaware of the studies in which the babies were given T3 and followed up. In transient hypothyroidism the T4 gradually rises under such conditions in a matter of weeks whereas in permanent hypothyroidism it does not[30]. They could have easily tried this in at least a subset of these cases, instead of starting them on thyroxine.

Transient hypothyroidism should specifically have been looked for especially in areas like Gonda and Deoria of eastern UP where a higher proportion of birth complications and prematurity are likely among the hospital deliveries. In the control areas of Delhi and Kerala this proportion would be much less because even most of the normal deliveries there take place in hospitals.

Further it is not good policy to put babies with transient hypothyroidism on prolonged thyroxine treatment because of the danger of neonatal hyperthyroidism[34]. There is also some evidence that in neonatal hypothyroxinemia (low T4, high TSH) found in iodine deficiency environments compensatory increase in T3 is encountered and the babies are compensated[31].

Undoubtedly, more studies need to be done in this area before firm conclusions are drawn. But one thing to be noted even at this juncture is that the control areas, among which Delhi has been claimed to be a new endemic area, is remarkably free from neonatal hypothroidism, whether transient or otherwise.

New Endemic Areas

Starting from the fifties and till the seventies, the figures quoted for goitre incidence in India were 40 million people exposed with 9 million having goitre[1]. Then in the eighties, almost simultaneously with the beginnings of the new policy we see a quantum jump in the estimates. The newer estimates have the exposed population at 120 million with goitrous population of 40 million[36]. Even higher figures of 300 million exposed and 60 million goitrous are sometimes bandied about[37].

There is reason to believe that the new figures are part of a campaign based on gross exaggeration. It is generally part of an effort to impress the decision makers—political and bureaucratic—and to gain public acceptance for the new policy. It is based primarily on the basis of surveys conducted in different parts of the country followed by blind extrapolation of data using faulty mathematical models.

It is now claimed that of 132 districts studied, 122 provided evidence of iodine deficiency goitre. But there is no indication that these 132 districts or the areas surveyed were randomly selected. On the contrary, there is reason to believe that these areas were selected because they were suspected to be endemic for iodine deficiency. Extrapolation from these to arrive at total figures would be highly fallacious. It has indeed been claimed that the actual figures for the number of IDD in South-East Asia (including India) have probably been overestimated by a multiplicatory factor somewhere between 3 and 6 due to the bias in the mathematical models used[38a].

Moreover the lay public including the decision makers are misled in another more subtle way. They are told that there are 40 million goitrous people, often accompanied by a photograph of a person with a large neck swelling. The overall impression sought to be conveyed is that there are 40 million such people in the country. As a matter of fact the vast majority of the supposed goitrous people have thyroids which cannot even be seen. Even considering the figure of 40 million to be true, calculations made from the rates of various grades of goitre in the different surveys [38, 39, 40, 41] show that the visible goitres will not exceed 4 million. The clinically significant cases causing cosmetic problems will not exceed 0.6 million. If there is a four-fold overestimation in these figures, the actual figures would be, total goitrous 10 million, visible goitres 1 million and those producing clinical problems 0.15 million.

These projections are made considering the percentages of goitrous people obtained in the different surveys to be true. In reality, the surveys are liable to considerable bias and variation. It has been mentioned that the large majority of goitres detected in such surveys are not visible but palpable only. Any thyroid thought to be enlarged on palpation (a swelling as big as the terminal phalanx of the subject's thumb) is taken as a Grade I goitre[42]. This is highly subjective. When the surveyors are convinced of a high prevalence in an area this leads to unconscious inflation of the percentages. Palpable and visible goitres can be overestimated in individuals with thin necks or poorly developed sterno-mastoid muscles[9]. This is another source of error in a poorly nourished population like ours.

In the last few years one thrust of

argument has been that endemic goitre is no longer a problem of the sub-Himalayan region alone and that it is widely prevalent in other parts of India also. Surveys purporting to back this claim are few in number and subject to the same drawbacks mentioned above. The chance of error is greater because in almost all these surveys the result indicate only mild or moderate endemicity (prevalence below 50 per cent)[39, 41, 43, 44, 45]. The fact that such studies are limited to few isolated pockets has not prevented fantastic claims being made. Even the maps have been redrawn to show the new-found widespread prevalence of endemic goitre in India. These maps are patently dishonest. For example, few isolated pockets in Maharashtra have been surveyed. This has led to the whole state to be shaded and shown as endemic goitrous.

One way of checking the veracity of these survey results is by reference to exacting biological data like that of iodine excretion in urine. Urinary excretion of iodine as a proportion of the excretion of creatinine (iodine per gm of creatinine) when properly done is a good measure of iodine intake[42, 46]. Mean values of less than 50 ugms/gm of creatinine in a population is indicative of moderate iodine deficiency. Values less than 25 ugms indicate severe deficiency. This can be tested on casual urine samples and is thus a relatively easy procedure[42]. Yet very few such studies are available from India. The occasional study from areas outside the sub-Himalayan belt show no evidence of severe deficiency. The results in some studies flatly contradict the results of the survey thus casting doubts about the reliability of the survey results. For example, Krishnamachari reports severe endemia from Maharashtra i e, a 52 per cent prevalence. But the urinary iodine per gm of creatinine in that population ranges from 52 ugms to 141 ugms. Even the iodine content of drinking water in the area is normal. Yet it is one of the surveys based on which the whole of Maharashtra is shown as endemic goitrous!

Pandav et al report a goitre incidence of 55 per cent from Kalkaji and Chandni Chowk areas of Delhi. But this does not correlate well with their finding of mean urinary iodine/creatinine value of 48 ugm/gm[40]. They argue that this figure is artificially high because of the probability of low creatinine excretion by smaller Indian children. They say that the figure of 50 ugm/gm as the cut off point for endemic iodine deficiency was proposed for western children and that this would exceed by 20-30 per cent the values appropriate for their Indian counterparts. Here they are in error, for the value of 50 ugm/gm of creatinine was proposed by Follis et al based on their findings in the Songkhla province of Thailand and there is no reason to believe that it would be substantially different from the Indian mean values[48].

There is however need to standardise the iodine excretion values in the Indian population for getting comparative data. Differential values for boys and girls may be used depending upon their body weight[49]. It has been suggested that measurement of iodine concentration alone in urine is sufficient especially for monitoring control programmes[42]. Whatever it is, iodine deficiency is best monitored and graded by the measurement of urinary iodine excretion. Very little of such work has been done in India especially outside the Himalayan belt. No attempts have been made to standardise the values. Wherever goitre really exists significantly and iodine excretion does not reflect the degree of deficiency to account for it goitrogens have to be looked for. Such diverse things as contamination of water by sewage, organochlorine pesticides, and thiocyanate in tubers have been blamed in this context[42, 50]. Studies along these lines from India are singularly marked by their absence. There is reason to believe that blind extension of the studies done in the sub-Himalayan endemic to the rest of India may prove counterproductive in the long run.

The Question of Safety

The most hotly debated issue in the new policy concerns the safety of iodine prophylaxis. Two extreme views are generally held. On the one hand it is held that iodation of salt can produce as many problems as it solves and should not be resorted to at all. The supporters of the policy on the other hand dismiss out of hand any reports regarding the complications. Pandav et al mention allergic reactions to iodine, iodine-induced hyperthyroidism, iodism and iodide goitre as the generally reported complications. They then proceed to demolish the claim for allergic reactions without discussing the others at all[51]. Kochupillai in an article claims that up to 400 ugms intake of iodine is not only safe but salubrious[11]. As with most extreme polemical views, the truth resides somewhere in between.

it is absolutely true that allergic reactions to iodine and iodism occur due to administration of pharmacologic doses of iodine and is absent in the usual prophylactic programmes. But the following complications need to be given serious thought: (a) iodide goitre (b) iodine-induced thyrotoxicosis (c) sequelae of possible increase in salt intake.

Iodide goitre: It is well known that pharmacological excess of iodide can produce goitre[52]. Extremely high intakes of iodide can produce endemic goitre as seen in the Hokkaido coast of Japan where it is due to high intake of the seaweed 'Kombu' in soup[53]. But can it also occur as the result of a prophylactic programme? The answer seems to be a qualified 'yes'. It appears that milder forms of endemic goitre can be a result of prophylaxis with iodised salt. A survey conducted in four areas of the US in 7,785 children showed an overall goitre prevalence of 6.8 per cent. In Michigan state the prevalence was 9.8 per cent. These endemic levels are seen many decades after the introduction of the salt iodisation programme. In all these areas iodine intake was more than adequate with a mean urinary iodine excretion of 452 ugm/gm of creatinine. More interestingly it was found that children with goitre and areas with high goitre prevalence tended to have higher rather than lower iodine excretion[54]. A ten-state nutrition survey of 35,999 people in the US similarly found a higher prevalence of goitre among persons excreting high levels of iodine[55]. The same study found an overall prevalence of 3.1 per cent with a high of 7.2 per cent in California.

It can however be argued that the overall incidence of goitre in the US was much higher prior to salt iodisation. While this is no doubt true of the US, it is by no means the rule. For example there are reports that in Iran and Iraq the incidence of goitre among school children increased after prophylactic use of iodide[56]. It is worth noting that such iodide goitres are mainly reported from the US and countries which have followed the US in using high levels of iodide in their salt iodisation programmes.

Iodine-induced thyrotoxicosis: Mild iodide goitre produced by salt iodisation programmes, if and when it occurs, is only a minor public health problem. But thyrotoxicosis, i e, disease due to hyperfunctioning of the thyroid gland is much more serious and cannot be dismissed lightly.

Iodine-induced hyperthyroidism, the so-called Jodbasedow effect has been the subject of many reports since the beginning of this century. Early reports noted the precipitation of hyperthyroidism in goitrous patients who were administered large doses of iodine. The iodisation of salt in parts of the US in the 1920s seems to have been followed by a temporary increase in toxic nodular goitre (one form of hyperthyroidism). While the earlier reports were all in those receiving high doses of iodine, it was however convincingly shown that physiological doses can also provoke toxic goitre. This was done in a study from Tasmania where a prophylactic programme based on iodation of bread was initiated in 1966[57]. The incidence of thyrotoxicosis in Tasmania showed a steep rise in 1966 and this higher incidence was maintained in 1967 and 1968. The increase was evident after iodation of bread was begun.

In defence of iodation programmes, it is however pointed out that the outbreak of thyrotoxicosis in Tasmania occurred predominantly in old people with long-standing nodular goitres. It is also known that the iodation of bread was effective in bringing down the levels of goitre in the community[58] so that such forms of thyrotoxicosis disappeared along with endemic goitre from the region eventually.

This argument is reasonable to a certain limit. In an area where there are cases of endemic cretinism a few cases of thyrotoxicosis may seem a small price to pay for

getting rid of a graver problem. But what about areas of moderate or mild deficiency where endemic cretinism is not seen at all?

It has also been stated that iodine-induced hyperthyroidism is not seen in the Indian endemic after initiation of prophylaxis. This is assumed to be due to the younger age structure of the population. But this claim cannot be accepted blindly. Has the surveillance for thyrotoxicosis been conducted at all? Who detects the random cases of toxic goitre occurring in far-flung backward areas?

Thyrotoxicosis occurring as a temporary phenomenon in certain individuals in a goitrous population may be acceptable, provided the prophylaxis that induced it finally gets rid of it. This was the comfortable assumption till recently. But what about the non-endemic non-goitrous areas? Can there be an increase in thyrotoxicosis in such a population as well? If so it would be a definite point against introduction of iodisation of salt in the non-endemic areas.

Recent studies in England show that the peak of onset of thyrotoxicosis occurs in the winter months[59]. This has been shown to correlate with winter peak in milk iodide concentrations which in turn correlates with the urinary iodine excretion[60]. Milk provides about half the adult iodine intake in Britain in winter. The higher content of iodine in milk in winter is because the cattle are fed solely on cattle feed enriched with iodine and there is no grazing during the period. The urinary iodine excretions are not particularly high, with a median of 106 ugm/gm of creatinine. The study expresses concern that an excess of iodine may be harmful to some individuals and asks whether an alteration of iodine levels in cattle feed should be considered[60].

The whole question of levels of iodisation is also likely to be reopened by such findings. High levels of iodisation as practised in the US and sought to be implemented in India may not be so salubrious after all.

Possibility of increased salt intake: Problems like hypertension can be precipitated by increase in the salt intake. In many western nations the salt consumption is coming down as a result of this awareness. In India however the way iodised salt is sought to be popularised raises genuine fears whether it will not lead to an increase in salt consumption.

Iodised salt is presented almost as a restorative tonic with wondrous powers. Companies advertise freely claiming that anything from dullness to squint is due to iodine deficiency and that iodised salt is the cure for it. A private company has recently begun an advertising campaign presenting iodised salt as a 'healthy food'. There is no medical or ethical justification for this type of action[42]. Even the government is made to join in this unethical, unscientific marketing blitz. A comic book shows a boy performing badly in school and dropping catches in cricket. After consuming iodised salt he is transformed into a brilliant student and a cricketing hero. After reading such stuff how many mothers will be able to resist adding that little extra salt to their children's food? The most unfortunate bit is that the said publication is by the health and family welfare department of the GOI[61].

Towards an Alternative Strategy

The present strategy of universal iodisation is one in which the costs are borne by the consumers and the benefits accrue to the monopolies. The real costs are likely to be higher than envisaged. The costs presently calculated do not take into account the recurring expenditure for maintaining a vast network for quality control and underestimates the cost for several items like import of iodine. Furthermore the programme is not likely to succeed because the focus has shifted from the areas of severe endemicity. The whole programme is wasteful of resources and unmindful of the priorities facing the nation. There is no appreciation for the opportunity costs of iodisation, i e, what other programmes with possible impacts on health, such as immunisation or provision of safe drinking water, could achieve with the same money. The scientific data presented in support of the policy is open to question. Clearly an alternative strategy is called for.

Scientists are often trapped in the quagmire of their own reductionist thinking. This leads them to propose simple 'technological fixes' for problems of complex socio-economic origin. The failure of national nutrition programme to solve the problem of malnutrition and of national blindness eradication programme to solve the problem of Vitamin A deficiency should have been eloquent pointers. But no lessons seen to have been learnt. Waiting in the wings of future technological fixes are fortification of salt with iron for anaemia and a host of other similar reductionist solutions.

Endemic goitre too is a problem with socio-economic, developmental and ecological causes. These have to be understood properly and solved sincerely. Iodine deficiency of soil is related to flooding, deforestation and soil degradation possibly related to the newer agricultural technologies. A programme to combat iodine deficiency should essentially contain flood control measures, checking deforestation, soil improvement, proper use of pesticides and fertilisers and general eco-restoration. These measures will also help the people in more ways than simply reducing the incidence of goitre.

It is also known that lack of food exchanges are important in the causation of severe endemic goitre and endemic cretinism. This is also a question of development. It

has been noted in Mexico that the simple measure of building a road in an inaccessible area resulted in more of food exchanges and disappearance of endemic cretinism. Development and ecology are thus the keystones of a permanent solution to the problem of IDD.

This is not to say that a salt iodation programme has no role. In the severely endemic areas one cannot wait for the general development to occur first. The birth of babies with endemic cretinism is a tragic waste of human resources. In fact this is the problem that needs to be tackled most urgently. Areas of severe and moderate deficiency (which occurs in the sub-Himalayan belt) can be tackled best by a programme limited to those areas. In fact, focus should not be allowed to shift from these areas by the imperatives of the free market economy.

This calls for revival and strengthening of the old National Goitre Control Programme. The anomalies discussed earlier need to be corrected and efficient implementation ensured. Increased production of iodised salt through the public sector, vigorous quality control along with proper administrative measures to check entry of non-iodised salt and a proper public health education campaign in those areas should be the cornerstones of such a programme. Subsidy may be given at the level of the retailer or the consumer to bring the price of iodised salt at par with that of ordinary salt. In the most severely affected pockets with high rates of endemic cretinism, provision of iodised oil to expectant mothers could be considered. This can be done through the PHCs and can be integrated with the maternal and child health programmes.

Further studies to assess the problem in different parts of the country accurately are needed. Such studies should be based on the incidence of endemic cretinism and on urinary iodine excretion parameters. The problem of goitrogens in natural foods and in synthetic chemicals should also be subject of study.

The problem of IDD in India offers no easy solutions. Rather than instant bravado and shotgun solutions, a mature and realistic assessment of the whole problem is what is required. A national debate involving scientists, social workers, economists and politicians is called for.

Sickness in Indian Textile Industry

Prafull Anubhai

BAGARAM TULPULÈ's comment (February 18) on our paper raises some issues which need to be clarified.

Tulpule is not convinced that sickness is more prevalent in the composite sector than in the spinning sector. For this, he is relying only on the percentage of displaced workers in the two sectors. Our contention that "...within the organised sector, composite mills are worse off" was not based only on the analysis of closed mills. Closure is the terminal point of sickness. There are other units at different stages of sickness. A study of the health of the industry focusing on the two sectors based on some direct and indirect indicators helps us to understand this point better. We shall deal with these other indicators a little later.

First let us deal with Tulpule's observations regarding closed mills and displaced workers. Analysing the figures in Table 1 of our paper, Tulpule observes:

(i) "According to Table 1 in his paper, the percentage of sickness in composite mills is somewhat higher than in spinning mills."

(ii) "But the comparison of these percentages could be misleading. If, as is generally believed, it is the weaving stage in the composite mills that has rendered them sick due to competition from powerlooms, it would be logical to infer that the spindleage in the composite mills is rendered idle not because the spinning operation becomes uneconomical but because the whole mill goes sick due to uneconomical weaving. The higher percentage of closed spindles in composite mills is, therefore, of no special significance."

Let us take (i) above. Whether one takes the number of closed mills or the percentage of capacity rendered closed, the difference of 50 to 60 per cent (18 over 12 or 16 over 10) cannot be termed as "somewhat" higher.

Tulpule's contention that comparison of these percentages is "misleading" is based on the very point we are making, viz, that the composite mills suffer more because of the competition of powerlooms. Although there is some confusion in interpreting the data, we refrain from making any further comments on the same as we find that he has a priori assumed the observation we were making.

Tulpule then argues that if the number of displaced workers in closed mills is taken as the indicator of sickness, then sickness would appear to be higher in spinning mills. How valid is it to take such an indicator? In many cases, sickness is due to overstaffing. When we are talking about relative sickness in the two sectors, to use this as an indicator is misleading. Further analysis of our Table 1 brings out this point (see Table A). As can be seen in the table, the average size of the closed spinning mills (16,666 spindles) is less than the overall average size of spinning mills (18,490 spindles) and yet the average number of workers in such closed spinning mills (642 workers) is far higher than the general average number of workers in all the spinning mills (497 workers).

To sum up, capacity closed is one of the relevant indicators of sickness and not the number of displaced workers. There is little doubt about the comparative capacities closed here.

Further, our observation about sickness being more prevalent in the composite sector was based on several such indicators—number of units closed, growth of the spinning sector and the powerloom sector, relative movement of yarn and cloth prices, number of units falling sick and knocking at the doors of financial institutions and BIFR, losses incurred by composite mills in the last two years compared to the profits of the spinning sector, over-extension of suppliers' credit in the composite mills, increasing debt burden, etc. In a recent study done by ATIRA covering state textile units in Maharashtra, Gujarat, MP and UP, the finding was as under:

> The financial performance of the spinning mills has been relatively better, this group has shown cash profits in four out of the seven years covered by the study. The composite mills, on the other hand, have been generally running with cash losses.

From the latest IFC (Inter-Firm Comparison) Study carried out by ATIRA on the profitability of textile mills, the trend that emerges is given in Table B. The table brings out the trend in the relative health of the composite and spinning mills. As this point was so generally accepted, we had refrained from elaborating it earlier.

Tulpule questions our proposition that sickness is largely afflicting the organised sector. He cites lower utilisation of capacity in the powerloom sector as an indicator of poor health of that sector. The validity of this observation is questionable. The powerloom sector works on the basis of flexible production. This is its main strength. Utilisation varies with market situation. Cost of temporary idle capacity is very low as no wages are paid or overheads incurred. It is this factor which gives them a market advantage. This market advantage and lower operating costs make them profitable even at lower annual capacity utilisation. Lower utilisation does not mean sickness in this context. The growth of this sector has been phenomenal and so consistent (year after year) that it is difficult to argue that these entrepreneurs are a misguided lot, not knowing their interest and jumping one after the other on a sinking ship.

Tulpule also disputes the relative cost advantage of the powerloom sector by observing that the yarn cost of powerloom is more by 12 per cent. We do not know how he has arrived at this figure, but the study of ATIRA which we had cited does refer to this factor which according to them varies between 7.65 to 10.4 per cent (p 104 of the proceedings of the 26th Technological Conference, ATIRA, February 1985). The conclusion which we had quoted, viz, "the combination of powerloom weaving and power processing will be more cost effective than composite mills to the tune of about 10 per cent even if the excise duties were equalised" was reached after taking this into account. To quote further from the same study, "powerlooms incur higher (8-10 per cent) yarn costs than composite mills. Nevertheless cotton cloth woven on powerlooms is cheaper by 5-10 per cent than the equivalent mill cloth" (p 18 of ATIRA study).

Tulpule laments that when cotton prices were falling, mills did not take advantage to increase production and that the benefit of falling cotton prices was not passed on by reduction in cloth prices. We have already pointed out the long-term trend of fall in cloth production by the organised sector and the reasons thereof. (Emergence of a large number of spinning mills and the more cost effective powerloom sector for various reasons cited by us explain this.) We need not repeat the argument. As regards reduction in cloth prices, we should not lose sight of the incessant rise in other costs like power, fuel, chemicals, dyestuffs, stores, spares, etc, as brought out in our Table 10 (p M-151).

Regarding locational cost factors, Tulpule considers it to be misleading. His conten-

TABLE A: AVERAGE CAPACITIES

	Average Sps/Mill	Average Looms/Mill	No of Workers/Mill
Composite mills	44,645	745	3,039
Closed composite mills	38,615	638	2,096
Spinning mills	18,490	—	497
Closed spinning mills	16,666	—	642

Note: The figures above are derived from Table 1 of our paper. For example, the average number of spindles per composite mill is obtained by dividing the total number of spindles in composite mills by the number of composite mills, i e, 12590000/282 = 44645, and so on.

tion is that against these cost advantages one must weigh in the transportation costs of raw cotton and finished goods. Let us examine raw material transport. This depends on the spatial pattern and quality of cotton crop. (In the last few years, Punjab and Haryana have emerged as the largest cotton producing states.) There is, therefore, no clear-cut disadvantage to a particular area. For transportation of finished products, the market being the whole of India, if anything, the older surplus producer states will have a higher transportation cost. Further, what we had mentioned were differences in important cost factors. Incidentally, we assure Tulpule that the figures of wages mentioned by us are based on actual wages paid during the period April-June 1987.

Further, Tulpule raises the question as to how smaller capacities in the 'new' states can affect these larger capacities in a significant way. India is one market. With such large cost differences, it is inevitable that industry will shift to more profitable location and would decline in 'high cost' centres. We were trying to trace the roots of structural relocation which has started happening and warn that the 'older' states can ignore this reality only at their own peril. Such locational shifts start slowly and unless they are noted and counteracted with policy prescriptions, they become irreversible.

Another observation by Tulpule about the data on finances presented in Table 21 is misplaced. The observation reads: "In Table 21 Anubhai presents a picture of the finances of textile mills and the picture is none-too-rosy. But for private sector mills alone the picture is not quite as gloomy, for a large part of the gloom is contributed by the public sector mills." This data is based on IFC studies made by ATIRA over years and are expressed as converted into Rs '000 per equivalent loom. This sample was not collected sector-wise, i e, public and private. In fact, we understand that very few public sector mills participated in the IFC studies during those years and therefore the observation of Tulpule would not stand. In any case, these are trend data and show orders of magnitude and general direction.

Let us also react to a few other observations which relate to facts. Discussing modernisation and the dangers of pursuing it with an eye on the export market, Tulpule observes, "import of textile machinery is on OGL and is resulting in a net outgo of over Rs 500 crore per year in the name of modernisation". We are not clear about the source of this information. In any case, textile machinery import is not on OGL except for very few machines not manufactured within the country and, secondly, machinery imports are nowhere near the Rs 500 crore mentioned by him. In fact, they are as under for the latest year for which we have detailed information:

Import of Textile Machineries, Components and Accessories

(Rs crore)

	1984-85	1985-86
Cotton textile sector—machinery	10	13
Parts and accessories (presumably by the machinery building industry of India)	8	9
	18	22
Man-made fibre and filament industry	52	123
Other textile industry (wool, jute, etc)	21	19
Total	91	164

Source: Director General of Commercial Intelligence and Statistics, Government of India.

In Tulpule's opinion, the view that the industry should be made internationally competitive (as recommended by the Expert Committee in 1985) so as to provide a boost to exports lacks a sense of proportion and is somewhat frivolous. He, therefore, dubs it as "fetish for exports". He rejects the export potential of Indian industry *vis-a-vis* other countries like Pakistan, Hong Kong, Taiwan and Korea by (i) questioning the export statistics cited by us in Table 24; (ii) raising doubts about export statistics and yarn production statistics of Pakistan as per the ICMF *Handbook of Textile Statistics* (not cited by us); and (iii) feeling apprehensi that our decentralised sector would be star ed of yarn, if yarn export is allowed witho limits.

We fail to understand on what basis finds the data in Table 24 cited by us to b improbable. We give a further break-up the data (relating to India and Pakistan) clear up his disbelief (Table C). Tulpule the gives a curious twist to the argument b discrediting the data cited by himself an observing "how much weight should on give to these figures in diagnosing our pro blems and prescribing remedies?" Firstl this is not the data cited by us or relied upo by us. Secondly, even this data (which ar quite authentic) are not properly interprete by him.

The reported production of woven cotto cloth in Pakistan refers to production in th organised mill sector not including the pro duction of the decentralised sector, while ex ports of cloth includes cloth made both i the mill sector and decentralised sector. I appears that in Pakistan the producion o cloth in the decentralised sector is about 8 to 10 times that of the organised sector.

Further, Tulpule questions data about yarn production of Pakistan by stating that India's installed spindleage is over five times that of Pakistan, but its yarn production is shown to be only a little over 2.5 times that of Pakistan. This can be so because of several factors, such as, (1) higher utilisation, (2) coarser count, (3) better productivity, and (4) higher technology (more rotors compared to ring frames. The ICMF *Handbook* shows this to be so.)

After this shadow boxing with data, Tulpule asks what would have happened if unlimited yarn exports had been permitted and concludes by saying "would there have been a better example of making a fetish of exports?" Why should we assume that exports of yarn means lower domestic availability? Is production capacity inflexible? Do we not want growth? What constrains it? Had yarn exports been allowed, there would have been higher capacity utilisation, growth in spinning capacity, improvement in quality

and productivity induced by international competition, higher exchange earnings and higher employment. What is wrong with exports?

We also lay a great deal of stress on making our industry internationally competitive. We feel that without a hard-headed look at our costs, and pressures to be efficient even the cause of our domestic consumers will not be served. Too much sheltering has generated a high cost, 'static' culture and ill serves our consumers price-wise or quality-wise. One way to change this culture is to generate pressure to be internationally competitive and to adjust our industry and its structure to become efficient and vibrant. No exhortations will help. How to make the industry internationally competitive? Whether it will be through the latest and most automatic machines or through short-run customised labour-intensive technology will depend on the relative factor prices, labour laws and the relative quality levels acceptable in the international markets. No a priori judgments can be made about choice of technology nor can any conclusion be valid for all products and for all times.

Tulpule has made a sweeping generalisation that by adopting the latest technology (which itself is questionable and not supported by facts) the industry has made a wrong choice of technology and has as a result become sick. We do not find any evidence to support such a conclusion anywhere in his article. It requires a much more rigorous and complex analysis to reach such a conclusion taking various factor prices, technologies and products into account. However, if he means that in cases where modernisation is attempted without fully relating it to the kind of products to be manufactured and developing an economic justification for the same it could lead to disastrous result, I am in agreement with him.

Tulpule imputes a certain desire or motive in our discussion regarding retrenchment of labour in Bombay without bearing the cost of rationalisation. We meant this as a statement of fact rather than any desire or preference on our part. In fact, we were among the first to advocate a scheme to soften the blow of closure on the workers. We would not be presumptuous if we claim that the seed of the Textile Rehabilitation Fund was shown by us alongwith V L Mote in a presentation made by us at the Indian Institute of Management, Ahmedabad, in 1984.

The other issue raised by Tulpule is questioning profit as a yardstick for a socially desirable economic activity. Who determines what is socially desirable? Which products of what quality are desirable? Who should produce them? How should it be provided and by what combination of factors? These are the questions which must be answered. These are more fundamental questions of political economy and fall beyond the scope of our paper. The changes going on in USSR and China and witnessed in many other countries where market forces have been again given freer play point to a set of answers which are different from what Tulpule implies.

We could not agree more with Tulpule on the point that there is gross over-capacity and that some of this is unviable and that trade unions instead of opposing all closures should work for orderly closures and protection of workers' interest as much as possible. This is what we have always advocated. In fact, one of the purposes of writing the article was to make the unions aware of the larger factors leading to restructuring so that they can adjust their policies to optimise long-term employment and more orderly movement of labour.

Surprisingly, despite these different perceptions of data and some economic positions, we are happy to note that Tulpule recommends remedies which are very close to ours, except for some differences with regard to the importance of exports, modernisation and some other policy interventions. On fiscal reliefs, he goes far beyond duty reduction advocated by us and makes out a case even for a subsidy.

Food Subsidies: Costs and Benefits

The rural and urban poor in Andhra Pradesh have gained some Rs 240 per year per household from the rice rationing policy, but it is a temporary, tenuous gain. The subsidy may later be cut as budgetary constraints begin to bite. And even if the subsidy and ration are not reduced, the next crisis could come from the physical supply side. 1597

Subsidising food is a widely prevalent policy in most developing countries. Its form and dimension, however, varies across countries depending upon the mix of political, social and economic factors. Accordingly, the benefits and costs of specific food subsidy programmes policy differ significantly. The experience gained from different variants of food subsidy programmes can be of much help to policy-makers in developing countries in assessing and modifying their own food subsidy schemes with a view to making them more cost-effective. A review article. 1584

Crisis of Planning

The ever increasing inequality, uneven regional growth, vast and growing unemployment and large areas of the economy sinking deeper into the quagmire of non-development are all evidence of the deepening crisis of economic planning in India. The planning exercises for the Eighth Plan now under way show the same naive unawareness of vital, and long neglected, theoretical and empirical aspects of developmental planning. 1591

Government and Society

Objective circumstances in a country change much faster than the ability of its system of governance to adapt to them. What are the major changes that have taken place in India? What modifications do these call for in the country's system of governance? And what implications do these have for the civil services? 1577

The Jammu and Kashmir Panchayati Raj Bill, passed by the state legislature, betrays basic lack of trust in the people. The process of devolution envisaged under the bill is matched at every level by the extension of bureaucratic authority. 1567

Lost Land

In spite of laws prohibiting transfer of land from the tribals to non-tribals, tribals in Andhra Pradesh have been rapidly losing their lands. This process will now be accelerated by the decision of the Andhra Pradesh government, supported by all the political parties in the state assembly, to allow free transfer of land by non-tribals in the Agency Tracts. 1571

Facing the wrath of the naxalites in the rural areas, Telugu Desam Party activists are now urging chief minister Rama Rao to put an end to the killings of suspected naxalites in false 'encounters' and to punish police personnel guilty of committing atrocities on the people. 1570

Stockbrokers' Opera

Participation by the general investing public in the stock markets has of late declined to modest proportions. Instead, a relatively small number of stock-brokers enjoying the patronage of the financial institutions have been accounting for the bulk of the business transacted in the markets. 1558

Green Europe

Europe has a new political colour: Green. The one clear trend in the June elections to the European Parliament was the growing support for the green parties all over Europe. 1575

Out of Step?

Those who have been talking of the crumbling of socialism in China have totally misunderstood the import of recent developments there. It is not socialism versus democracy; the students in Beijing were demanding greater democracy within socialism. 1563

Are the social and political institutions of communist societies falling out of step with the enormous technological changes that have revolutionised production techniques and with the vast advances in the means of mass communication and information networks? 1566

Exploitation and Efficiency

IN a letter to the editor (May 13) Ashok Rudra writes that he does not expect me to read his writings. May I begin by warning him that I do, usually very carefully and often with envy.

In his letter Rudra claims that Chapter 4 of his book (*Indian Agricultural Economics*, Allied Publishers, 1982) is a critique of Mellor and that Rudra "did not have anything of [his] own to say in that chapter about markets being efficient or otherwise". Far from being the case of my not reading Rudra, the above remark suggests that Rudra does not read Rudra. One does not have to go very deep into the chapter for it is evident from its title, 'Myth of Money-Lending Efficiency', that Rudra *does* have something to say about efficiency. He begins by pointing out how bourgeois myth-makers have tried to demonstrate efficiency even in the institution of moneylending. And then he goes on to demolish such myths by systematically establishing the various 'aberrations' that occur in rural credit markets, from market fragmentation to the rejection of the concept of *rate* of interest. All this is done with such finesse that to have him suddenly turn around and claim that he has not done so is not just fallacious but extraordinarily modest.

What I was taking him up on in my *EPW* paper (Special Number, 1988, pp 2309-12) was anyway not the occurrence of efficiency or inefficiency in credit markets but a matter of implication which is widely misunderstood and I was claiming—as I still do—that Rudra also misunderstands it.

On the matter of efficiency my position is very close to that of Rudra. I have not read the paper by Mellor which Rudra attacks but, going by Rudra's interpretation of it, I have no sympathy for Mellor's case.

The analytical point that I was making in my *EPW* paper is that from the fact that a market is efficient we cannot deduce it to be competitive. In fact (and this is the paradoxical part) the most exploitative markets are also efficient. Thus while traditional monopoly or monopoly is inefficient, extortionate monopoly with interlinkage results in efficient outcomes. This seemingly abstract result has a very important implication. It means that we cannot simultaneously claim that a market exhibits (1) extreme exploitation and (2) inefficiency. Given that many economists in India describe rural markets as characterised by both extreme exploitation and inefficiency, here is a theoretical result which tries to make them reconsider their description.

Regarding the value-neutrality of 'Pareto Optimality', on reflection I feel I was wrong in suggesting that most economists use the expression 'Pareto Optimal' as pure description. I still feel that they ought to for it *is* pure description. Moreover, most careful theorists do use it in a value-neutral way. Rudra is right when he argues that Amartya Sen having to lecture to people that a state may be Pareto Optimal but thoroughly undesirable suggests that there are economists who misunderstand the status of 'Pareto Optimality'. But the same example shows that there are economists, like Amartya Sen, who do not.

Need Naxalites Not Respect the Civil Liberties of People?

I HAVE gone through the article 'Law and Order on Lease' by K Balagopal (June 17), with keen interest. I endorse the spirit of the article. At the same time, Balagopal has not been able to hide his pro-extremist bias and his contempt for political parties other than extremists.

As a champion of the civil liberties movement, Balagopal is not only expected to be above petty party politics but also appear to be so, if his organisation were to have credibility. He writes "...killing of poor people in the name of curbing extremism has long been legitimised in the state and *even those who are otherwise democratic do not protest much about it*" (emphasis added). He draws attention to how some 180 naxalites have been killed after NTR's assuming power and how very few people have spoken out against this. Why has such a situation come about? Should not responsible leaders like Balagopal ponder over the issue?

Gradually the extremists, especially the People War Group, is exposing itself as nothing but a bunch of anti-socials in the garb of a 'revolutionary ideology'. Otherwise how can one explain their kidnapping people and their resort to blackmailing? For example, one mandal praja parishad president, Malharrao, a young TDP man known for his pro-poor attitude was kidnapped and through this PWG blackmailed the government to release two of their arrested comrades. After the stipulated time Malharrao was brutally murdered. What does it show? PWG does not care to respect 'the right to live' of innocent people. Is it not a clear-cut case of an attack on civil liberties by the PWG? One cannot go on fighting for the civil liberties of those who do not have even an iota of respect for the civil liberties of others. No doubt, the government at times under the pretext of curbing extremists is harassing innocent people. But then the naxalites are doing the same thing. So people are justifiably becoming indifferent to the false encounters, etc.

I don't know how Balagopal can support even indirectly the murder of D Chenchuramaiah, a relative of the chief minister, at Karamchedu. Otherwise how can he write, "... The murder has undoubtedly given a *much needed shock* to the landed gentry..." (emphasis added). One cannot have two different sets of civil liberties, one for ordinary people and another for the extremists.

ECONOMIC AND POLITICAL WEEKLY

Costly Stubbornness

IT would be naive to believe that the World Bank's gesture of extending the deadline for expediting the Narmada project rehabilitation schemes will really compel the Indian government to move in that direction. Nor will it make for substantial changes in the policy on the project. For it is not as if the implementation of the rehabilitation schemes has suffered from time constraints. At best the Bank's gesture of first announcing the withholding of the loan instalment and then of magnanimously allowing more time, should be read for what it is—a recognition of the growing popular movement against the project.

The fact of the matter is that the almost every aspect of the project has come in for heavy criticism from experts. The cost estimates of the project are now reckoned to have been a gross underestimate, especially given the overrun on time schedules. Moreover, financial allocations other than the World Bank's $ 450 million grant and the promised Japanese grant of $ 150 million have reportedly been hard to come by both in the states and at the centre. The much-publicised claim that the project will make water shortages a "thing of the past" in Gujarat has been shown to be totally false. For instance, 81 per cent of the talukas in Saurashtra and more than half of those in Kutch will not receive any water from the project. Nor will more than 67 per cent of the drought prone and arid regions of the state. As for environmental considerations, it has now come to light that the department of environment had in its first report drawn attention to the astronomical environmental cost of the project and had called for its postponement until more detailed analysis could be conducted. The Sardar Sarovar Project will submerge almost 14,000 hectares of forest land and much of the wild life in it and there are as yet no reliable studies on the impact of the dam on the ecology of the Narmada river.

The issue which has been the central focus of the movement is that of relief and rehabilitation. Almost none of the objectives of the policy laid down by the Narmada Control Authority have been fulfilled. The social and health conditions of the minuscule numbers of Narmada oustees who have been rehabilitated is deteriorating according to several independent surveys. The oustees are as per policy to be relocated in village units. This too has been violated for lack of availability of adequate land in one place. More importantly, the entire rehabilitation policy is based on what appears to be an underestimate of the numbers who will be ousted by the scheme because the government's figures are based on the 1981 Census. Moreover, they have not taken into account those who have already been ousted from dam sites on which construction has already begun. For all these reasons the rehabilitation scheme is unimplementable which, incidentally, is the opinion expressed by the rehabilitation expert and anthropologist for the World Bank.

It is not, therefore, as if the government of India has been unaware of the problems with the project. The project authorities and the governments concerned have dealt with the queries and the demands of the mass movement in what has now come to be the typical manner in which the establishment counters protests of this sort. They have suppressed information—reports of technical and environmental experts and even the proceedings of the Narmada Control Authority, accused mass activists of being in the pay of 'foreign powers', and brushed aside every criticism and query. In the circumstance seeking to put pressure on the Indian government via the World Bank is only of limited significance in the long run. The government may be forced in this particular instance to make some accommodations to suit the World Bank, but these will remain *ad hoc* and temporary measures which will have little impact on the government's long-term policy on large scale 'development' projects, whether they be multipurpose projects such as this one or nuclear power projects.

While obviously the threat of withholding aid may yield results, the more important line of action lies in persuading the government to create channels through which such projects are subject to the scrutiny of the people who are affected and of independent technical experts. One such would be the instituting of a proper public inquiry, as has often been done in Britain on major projects. There is, of course, the danger that such a forum may get distorted to such an extent as to become a mere gesture—as in fact has happened in case of the first-ever public inquiry in India on a technical subject affecting large populations, the Supreme Court-directed inquiry on estrogen-progesterone drug. On the other hand, however, the growing movements around these issues everywhere have created a climate for pressing for a properly constituted forum of discussion. One such recent example was the seminar on Kaiga last year organised by the Karnataka government under pressure from anti-nuclear activists in the state and elsewhere. Quite obviously such demands can only be made in the context of mass mobilisation and action.

ADULT EDUCATION

Not for Workers

THE ministry of human resources development has suddenly woken up. A two-day conference of the Central Advisory Board of Education in Delhi recently deliberated, among other things, on the failure of the adult literacy programme to take off. The union minister, Shiv Shankar, blamed the board, which is the top decision-making body for education, for the tardy progress. But neither the minister's harangue nor the discussions at the conference could throw any light on the basic reasons for the failure. Following the minister's advice to galvanise the implementation of the programme, the usual formula-ridden decisions were adopted adding to the list of similar resolutions that have been accumulating for the last four decades.

It is indeed strange how in spite of past reviews of the functioning of adult education schemes—some of which had pinpointed the basic flaws in the system, and had recommended alternative modes of functioning—little has been done so far to correct the system. A study group was set up in February 1966 under the auspices of the Department of Adult Education, National Council of Educational Research and Training, which made several recommendations for polyvalent adult education for workers. Some 40-odd Shramik Vidyapeeths are operating in different parts of the country with the objective of providing polyvalent education. The main target is the large population of first generation migrants working in different sectors in the urban and industrial areas, who form a lower level as compared with the skilled workers in the organised sector. These Vidyapeeths are expected to formulate adult education schemes that would integrate general education and awareness with skill training so that their social and vocational needs are inter-related.

Some years ago an official review of the functioning of these Vidyapeeths was undertaken. The review by the Prayag Mehta Committee revealed that the Vidyapeeths had been under official pressure for increasing the number of schemes (obviously to impress ministers constantly demanding target-oriented performances, oblivious of the quality of the content), as a result of which there had been a steep jump in the number of various schemes in practically all the Vidyapeeths. But in the process, the original purpose of polyvalent education had been diluted. Instead of catering to the multifarious needs of the deprived, neglected, migrant and other categories of organised and unorganised urban workers, the schemes had been formulated in such a way as to benefit the middle classes. For instance, the Vidyapeeths claimed a rise in the number of women beneficiaries to demonstrate that they were reaching the underprivileged. But who were these women? It was found that most of them came from middle class families and were attracted to traditional domestic skills like cutting and sewing, embroidery, food preservation which were being taught in the Vidyapeeths. Unorganised women workers or women from such families were largely left out of these skill training courses.

It was also found out that employers in the organised sector did not release workers for the educational programmes, while the unorganised sector workers as well as scheduled caste and scheduled tribe people did not seem to be attracted towards the Vidyapeeth schemes. The apathy of the latter is quite understandable. The Shramik Vidyapeeth operating in the Rourkela steel plant area for instance, is quite often faced with the question from these people: "What is the benefit of any education or skill training, if we are not provided with finance or resources for self-employment or without an assurance for a job?" If the development agencies and government organisations do not supplement the educational efforts with adequate resources and infrastructure for the Vidyapeeth-trained workers, a competitive game of numbers with each Vidyapeeth showing a quantitative increase in schemes leads nowhere.

The quantitative fixation of the Vidyapeeths is a direct result of the quantitative orientation of the Directorate of Adult Education and other departments of the ministry of human resources which remain contented as long as the number of programmes and beneficiaries can be shown to have increased from year to year, unmindful of the quality of the programmes and the class of the beneficiaries.

FOODGRAINS

Not Pure Economics

EVEN though foodgrains production in 1988-89 was a record 170 million tonnes, the poor management of the food economy this year is reason for some degree of distress and alarm. A reduced proportion of procurement in and following a year of high output is reflective of poor management when viewed against the low level of stock of foodgrains (9.48 million tonnes) as on January 1 this year.

The stocks of foodgrains with the central and state governments at the beginning of the year during the last four years were 25.21 million tonnes (1986), 23.63 million tonnes (1987), 14.14 million tonnes (1988) and 9.48 million tonnes (1989). The level as on June 30 this year was 9.4 million tonnes. This should be viewed against the March 1984 decision of the government to maintain a buffer stock of 10 million tonnes. This buffer stock would be over and above the operational stocks, which would range between 6.5 million tonnes on April 1 and 11.4 million tonnes on July 1.

The reduced procurement in 1987-88 of 13.42 million tonnes in a year of low foodgrains production (138.41 million tonnes), coupled with a high level of demand led to depletion of stocks which was, to some extent, kept in check by imports. Low procurement this year would create an alarming price situation in the coming months, especially the period October to January. The government seems to be buttressing speculative purchases by the private trade which expects rising prices in the coming months. But it is an election year and given a situation of poor procurement and low stocks, the union food and civil supplies ministry may well decide to import substantial quantities of both wheat and rice.

This brings us to allegations of discrimination in the distribution of foodgrains to non-Congress governed states. As it is, the central government has reduced the rice quota of most states after a review of the available stocks in the central pool. Recently, Sukh Ram, the union minister of state for food and civil supplies, told an all-party delegation of West Bengal MLAs that the state government should purchase rice from the open market and then subsidise the cost through the public distribution system (PDS).

This delegation also drew attention to the substandard quality of rice supplied by the Food Corporation for distribution through the PDS. Incidentally, a recent COPU report (52nd Report, *Food Corporation of India: Despatches of Substandard Wheat*) flayed the FCI for its "wanton disregard of norms of quality control" in the despatch of foodgrains stored in its godowns to various destinations.

So all these issues are not matters of pure economics but of political economy.

LETHAL CHEMICALS

Case for Export Curbs

THE government of India's attitude to the entire issue of the export of dual-use chemicals to Iraq from an Indian firm, while it follows the same track as the nation's policy on global disarmament, is one of a rather miffed child being reprimanded. Its arguments are at best specious. The fact that time and again India's stand on disarmament and its "abhorrence of these [chemical] weapons" and its "commitment to their elimination" has been reaffirmed in various international fora does not necessarily mean that India has not been guilty of exporting what it calls dual-use chemicals knowing fully well that these could be and are in fact, used for the manufacture of poison gas. That it has been doing so for quite some time is quite obvious from the fact that an embassy spokesperson in the US stated in defence of the export that "the problem of precursor chemicals has been brought to our notice very recently. . . .there is no well-established international regime to take care of such chemicals."

The fact of the matter is that international controls on chemical weapons are nowhere near as stringent as they ought to be. One reason for this is, of course, the fact that the

issue of chemical weapons and their ban has, in the context of the far more important issue of nuclear arms, been neglected. In recent years, however, the issue has come up for more serious discussion, most recently at Paris where India is reported to have played a "positive and constructive role". The other reason is that because of the very nature of chemical weapons it is far more difficult to implement stringent control measures for their production or proliferation. Thus, for instance, a country which agrees not to acquire or produce chemical weapons or export them could with impunity produce and export intermediates which in any case may be of use in other products. The manufacture of chemical weapons does not require sophisticated processes nor intermediates which are exclusive to their manufacture.

However, the concern that has been expressed in the west that India may emerge as the "new battleground in efforts to prevent the stockpiling of chemical weapons" in West Asia cannot be shrugged off. Since the Bhopal disaster the fact that there are few controls on the manufacture and storage of chemicals has become well known. Reportedly chemicals far more hazardous than MIC are being widely manufactured, stored and transported with few safety precautions being taken. Export rules for chemicals are hardly framed to take into account their hazardous nature or whether they may be used as precursors for chemical weapons.

In the circumstances, for India to take affront at the suggestion that the manufacture of some of these chemicals should be banned can hardly be justified. While it is true that the precursors are multi-use chemicals which are necessary for the manufacture of a range of products, it is also true that substitutes which may or may not involve a change in the process of manufacture are available for at least some of these. The substitution may no doubt present numerous problems particularly for third world countries which may then have to depend on western industry to 'modernise'. Even so to take the view that because of this such a ban would be 'discriminatory' makes India's stand against chemical weapons rather a farce. What is urgently needed is a review of the controls on the manufacture and export of hazardous chemicals as a whole so that the 'dual-use' chemicals can at least be properly listed.

TELECOMMUNICATIONS

All Round Dependence

THE functioning of the Telecom Commission headed by Sam Pitroda can at best be viewed as a managerial change within the system. This might sound a bit pessimistic, for the creation of fresh institutions with considerable executive powers holds out the promise of an overhaul of sub-systems. If one were to hold the latter position and believe that individuals can bring about structural changes, then one would expect a transition, over a period of time, from a position of technological dependence to technological self-reliance. But such an optimistic view seems unwarranted, indeed, naive. For after all, even after 40 years our industry still has to seek a foreign collaboration to produce the simplest of terminals, the telephone, as we go from the rotary dial type to the push button one. And even these are being supplied by the collaborators on a SKD/CKD basis which means that the Indian units merely assemble them before supply to the Mahanagar Telephone Nigams. The foreign collaborators for these instruments are transnational corporations like Siemens, ITT and Ericsson. Their Indian links include some of the leading business houses and state electronic corporations. There will be a substantial import content in the instruments till indigenous production of components gets established.

Sam Pitroda has recently ruled out foreign collaboration in establishing the second digital electronic switching system factory. The first was set up by ITI at Mankapur based on technology imported from CIT Alcatel of France. This unit went on stream in 1985-86 but capacity utilisation hovers around break even point with a large component of CKD/SKD imports. Pitroda expects C-DOT's MAX technology to be commercialised soon which looks like a difficult proposition. The uncertainty in commercialisation of this 'infant' technology would probably mean more imports of digital switching systems, according to some critics. But equipment policy is now determined by the Telecom Commission which is headed by Pitroda.

The focus of the debate has been on main electronic switching systems but even if one takes telephone instruments, PBXs or cables, the scenario is one of foreign collaborations and imports. For instance, Jeumont Schneider (France) and Oki (Japan) and their Indian licencees are said to be making it difficult for C- DOT PBXs at the customer end. The manufacturers of the C-DOT version are facing stiff competition from the Indian business groups who have tied up with the MNCs.

Even though domestic production capacities for the manufacture (assembly) of telecom equipment is being established it is surprising that integrated circuits (ICs), an item that accounts for a significant proportion of equipment costs, is still almost totally imported. And this notwithstanding the fact that the public sector firm Semiconductors has been around for quite some time. Then why are almost all ICs still imported?

SOUTH AFRICA

An Ideology in Crisis

WITH the recent changes in its leadership, South Africa's ruling National Party has assumed a new political stance, veering a from its erstwhile obduracy on the aparth issue to a cautious and, perhaps, delibera ambiguous position on constitutio reform to accommodate the black majo within the country's political process. Th is certainly no reason to believe that subst tive changes are on the immediate agen given the regime's penchant for duplic Talk of reform may, therefore, be rheto more than anything else. That, however not sufficient reason to dismiss it as incon quential. Rhetoric it presumably is, bu certain significance attaches to it, for it rhetoric of a different order and, more i portantly, one that emanates from a ruli party that is likely to retain power in the f thcoming September elections.

The National Party's long tenure in offi surviving the crises of the 70s and the 8 has much to do with its political pragmatis that has enabled it, chameleon like, change its complexion according to t situation. If its current rhetoric is one mo instance of its astute reading of the whit dominated electorate then it would refle divisions among the whites on the issue apartheid in its current form. Indeed, t reaction to the five-year action plan f reform suggested by the party's federal co gress appears to confirm the fact of such division. The party's two-page documen employing the typical circumlocutory idio of apartheid, speaks of preserving grou rights, separate community recreation an white veto. Minus the verbal dressing, simply means the perpetuation of racial div sion. The crucial difference, however, is th call for negotiations with the blacks, thoug remaining silent about what precisely is t be negotiated. While the African Nation Congress' rejection of the plan was only t be expected and for obvious reasons, i savaging by the liberal Democratic Party an by the right and ultra-right parties, like th official opposition, the Conservative Part and the Herstigte Nasionale Party, flow fro diametrically opposed motives, the forme condemning it for prolonging raci discrimination, while the latter see it as step towards white surrender.

The National Party is quite obviousl treading the middle path calling for negotia tions with the blacks without conceding an of their preliminary demands while at th same time preserving group rights and whit veto, in an attempt to conciliate these tw divergent tendencies. There are other indica tions too that the racist ideology has lost it old capacity to unify the whites. Th attempts of the atavistic Conservativ Party-held town councils to reintroduc 'petty apartheid'—entry restriction i municipal properties such as toilets, park benches, cinemas and the like—were severel criticised by whites in such areas, not th least of the reasons being the crippling effects of a black boycott of white commercial establishments. While this division among whites is certainly promising, stiff

opposition to reforms is likely from the entrenched and brutal military and bureaucratic quarters which grew in power under Botha and which today plays a leading role in South African politics. However, with mounting international pressure their capacity to stall reform moves may be substantially vitiated.

While the ANC, too, is beginning to move towards negotiations with the regime, it has rejected the plan since minority veto is a part of the package. Negotiations which exclude the ANC will have little legitimacy—a fact that Pretoria is probably aware of. Consequently, bringing the ANC to the negotiating table would require a further climb down by the government.

BUSINESS

STOCK MARKET

No Decline in Public Participation

SPECTACULAR recovery from the May-end lows carrying the BSE and *Financial Express* equity price indices (Bombay and all-India) to new all-time highs about the beginning of July—*Economic Times* indices kept below their previous highs—and a sizeable retreat thereafter would be quite an appropriate description of the stock market's overall performance during the past six weeks or so. Between May-end and July 4-5, the BSE sensitive index rose by 15.5 per cent and the national index by 11.3 per cent, showing a rise of 2 per cent and 0.75 per cent over their respective April highs. During the same period, the *Financial Express* equity price index for Bombay recorded a rise of 14.2 per cent and the all-India index was 12.9 per cent up, improving upon their April highs by 1.4 per cent and 2.3 per cent respectively.

Consistent buying by financial institutions—UTI, LIC, GIC and mutual funds— and investors, highly reassuring corporate news, government's decision to privatise hitherto completely public domain such as power generation, telecom equipment, oil drilling, road and bridge construction and satisfactory progress of the south-west monsoon holding out hope of accelerated economic tempo—all these factors contributed in varying measures to the renewed upsurge in the market.

In view of the sharp upswing which took it into new high ground it was natural for the market to take a pause to allow technical forces to have their play. The rise was steep enough to lure mutual funds to convert some of their holdings into cash for reinvestment at a more opportune time. Institutional selling was a green signal for bear speculators and they were quick to act. The decline in prices uncovered many weak bull positions. Within just four trading sessions, that is by July 11, the BSE sensitive and national indices retraced 39.2 per cent and 35.2 per cent respectively of the ground gained in the preceding upswing. The retracing by the *Financial Express* index for Bombay was 32.9 per cent and that by the all-India index 36.1 per cent. How far the reactionary trend might go is anybody's guess. In the preceding corrective phase during May the BSE sensitive and national indices had retraced 59 per cent and 49.3 per cent respectively of the rise in the immediately preceding January-April bull phase.

Talking to a cross-section of the stock exchange fraternity about the state of the market has been an interesting experience. All kinds of views have been expressed. It would be of interest to take note of what market men have to say. The commonly held view is that all the important moves—up or down—are initiated by the purchases and sales by institutional investors followed up later by professional speculators and the general trading public. Only a relatively small number of stockbrokers enjoy the patronage of financial institutions and these brokers, accounting for a large proportion of the total business transacted in the market, fully exploit their position for personal gains, legitimate as well as illegitimate. Participation by the general investing public has of late declined to modest proportions.

Mutual funds buy and sell more frequently than UTI to take advantage of the wide swings in equity prices. It is said that UTI rarely figures as a major seller and, not unoften, its purchases are carried out at the instance of the union finance ministry—not necessarily to perform rescue operation. Occasional intervention by institutional investors is said to have given rise to unpredictable price fluctuations.

There is no way of preventing influential and resourceful brokers enjoying institutional patronage from abusing their position. The same point can also be made in regard to insider trading. Inquiries with informed sources indicate that, contrary to the popular notion, the volume of business put through on the exchange is by no means concentrated in a few hands. Top 50 brokers in Bombay are said to account for just a third of the total turnover (inclusive of institutional business). This means that the business is fairly diffused.

The view expressed by several market men about the decline in participation by the general investing public cannot bear close scrutiny. Apart from the fairly high level of turnover in non- specified scrips, the impressive response to new isssues of equity shares and debentures, especially convertible debentures, is a good measure of growing investor interest in the capital market. The equity boom has diverted investors' attention from the secondary market to the primary market where shares are offered at par or at a modest premium and this is certainly a welcome development.

A study of the pattern of ownership and the size of holdings of new issues listed on the Bombay stock exchange in May 1989 shows that individuals constitute the backbone of the new issue investment accounting for two-thirds of the total new isssues while the foreign contributions accounted for about 12 per cent and institutional contributions accounted for the rest. Distribution-wise, the proportion of holdings in the range of Rs zero to 10,000 was 99.4 per cent in numbers accounting for 32.1 per cent in the amount of new issues. The holdings of above Rs 1 lakh accounting for less than 1 per cent in numbers were responsible for 65.2 per cent in terms of the amount of new issues. This contribution came mainly from institutions and promoters.

The growing presence of institutional investors in the market—secondary as well as primary—has no doubt emerged as an important factor to reckon with in assessing the outlook for equities. But there is no getting away from the fact that despite occasional speculative excesses and grave errors of optimism and pessimism, there is a distinctly discernible rhythm in market movements. Short-term fluctuations have little to do with the fundamental factors and these are influenced essentially by the mercurial trading sentiment and technical considerations.

The decline in equity price indices during June-July, mid-November to early January and more recently in May represents healthy technical corrections in the primary upward trend which has been in evidence since the end of March 1988. The point has been made by some technical analysts that unlike in the earlier corrective phases when the market subsequently pushed its way into new high ground leaving the previous peak way behind, the market this time has staged a quick retreat after registering only marginal improvement over its April high. This is being interpreted to indicate that the bull market has lost its momentum.

While the journey at the high altitudes

in an hitherto unexplored territory can prove to be quite tough, it would be rash to jump to the conclusion that the bull market has run its full course when all the economic and market fundamentals are still very favourable. Only the other day the UTI chief Pherwani listed as many as 21 factors favourable from the viewpoint of the stock market. Very broadly, these factors could be categorised as falling under improved economic fundamentals, government commitment to promote healthy capital market and enhanced confidence in government policies towards liberalisation and deregulation. The biggest bull factor is that the UTI has emerged as the largest institutional investor in the capital market and its chairman is highly optimistic about the outlook for equities.

With both government and financial institutions facing resources crunch, the capital market will be required to play a crucial role in mobilising household savings for financing corporate sector's expanding requirements. The growing trend towards financialisation of household savings will facilitate the task of resource mobilisation which in turn will ensure increasing flow of investible funds seeking deployment in the primary as well as secondary market. The demand-supply equation for good growth equity shares has already undergone a phenomenal change over the past few years. Imagine UTI investment in equity shares going up from Rs 370.75 crore in 1985-86 to Rs 2262.60 crore in 1988-89. Add to this investment by mutual funds.

SHIPPING

Fleet Growth May Suffer

ACCORDING to the revised projections made by the working group on shipping, the shipping sector will require Rs 12,000 crore for acquiring 9 million dead weight tonnage (dwt) during the Eighth Plan period. The major portion of these funds will have to be provided in foreign exchange for import of ships.

The working group has pointed out that the Seventh Plan will end up with a capacity of 5.8 million tonnes against the target of 7.5 million tonnes. The main reason for the shortfall in the Seventh Plan target is the prolonged recession faced by the industry and the consequent paucity of resources. There was also a massive scrapping of old ships amounting to two million tonnes. The group has estimated that during the Eighth Plan at least 1.5 million dwt will have to be scrapped.

It is pointed out that the recommended acquisition of nine million tonnes is essential if hiring of foreign liners on a large-scale is to be checked during the next plan period. The user ministries have raised their projections significantly. For instance, the petroleum ministry has stated that during the plan period much larger quantities of crude will have to be imported. The crude imports are expected to increase from the present level of 17 million tonnes to 32 million tonnes by the end of the Eighth Plan. The power sector has projected that during the Eighth Plan period, at least 15 million tonnes of coal will have to be imported for the super thermal stations coming up in the southern region. Moreover even the coal mined in the Orissa coal belt will have to be moved through the coastal routes since the railways have expressed their inability to carry the same. The railway capacity on the southern route is already saturated. The commerce ministry has projected a 12 per cent annual growth rate for exports during the plan period. This alone will call for larger acquisition to enable the domestic shipping companies to meet their export commitment.

Given the country's requirements, the working group's recommendation to acquire nine million dwt during the Eighth Plan period is not very ambitious. However, the tight foreign exchange situation facing the country is likely to hit hard the country's ship acquisition programme. This is all the more so because the prices of ships have more than doubled since 1987 and the rupee has depreciated against the US dollar by over 25 per cent. In fact the country has lost a good opportunity to augment its fleet when the ship prices had touched rock bottom levels.

With a view to conserving foreign exchange, the government is taking a fresh look at the formula evolved by the Shipping Credit and Investment Company of India (SCICI) for financing the shipping companies. Under the present formula, 40 per cent of the total package is provided as foreign currency loan, another 40 per cent in the form of rupee loan. The balance 20 per cent is to be brought by companies and promoters as minimum contribution. The SCICI has cautioned the government that any attempt to limit the flow of foreign exchange to shipping industry would further hit the plan target of acquisition of ships. As it is, the target already appears beyond reach because of the increase in the prices of ships.

The SCICI has pointed out that investment in ship acquisition generates foreign exchange earnings or saving of foreign exchange outgo without any gestation period. The payback period for foreign exchange invested for acquiring of ships is very short, ranging from two to four years, depending on the class of vessel acquired, the price level and the pattern of financing.

TWENTY YEARS AGO

EPW, Special Number July 1969

The budget has so far been practically the only financial instrument of planning. Budgetary appropriations have been almost the sole constituent of what have gone by the name of annual plans. Nationalisation of major private banks invests government with another potent and far more positive instrument for mobilisation and reallocation of resources... Take the baffling problems of concentration of economic power and development of backward regions within states. About 600 and odd credit accounts at present receive approximately two-thirds of total bank credit. Without in any manner starving these accounts of genuine requirements of working as well as growth capital, their actual requirements can be scrutinised more closely to prevent them from pre-empting credit from others as also to relate their credit requirements to their ability to raise larger internal resources. It might even be possible to impose stiffer margins against their advances, to regulate their inventories and to prevent the more speculative among them from such activities as cornering of other companies' shares with their or banks' money. The development of backward regions brooks no delay. The nationalised banking structure cannot draw up the physical plans for this purpose; it can only assess their economic feasibility, advise on the scheduling of programmes and provide part of the funds required. This is not a matter concerning industry—or agriculture and small industry—alone. It requires the taking of a total view of the local situation and potential, inclusive of trade, transport and education... It is no doubt tempting to make sectoral allocations the corner-stone of credit planning at the national level: so much for agriculture, large industry, small industry, irrigation, power, and so on. While aggregations of this sort are necessary for the plan arithmetic and for reconciliation of conflicting claims on available resources, playing about with aggregates alone would invite repetition of the mishaps that have bedevilled planning in the past. There must, first, be a stock of projects with established feasibility; their priorities *inter se* must be clearly stated and articulated in terms of their inter-dependence at various levels of achievement. Their credit requirements can then be added up, chopped and pared into consistency with overall targets. Work on credit estimates, therefore, has to start from both ends.

ITC

Better Margins

ITC's trading results for the 9-month period reflect significant improvement in performance in all its businesses. Overall turnover has been Rs 355 crore against Rs 371 crore in the preceding 12 months and gross profit is Rs 53 crore against Rs 51.86 crore showing enhancement of profit margins. Net profit is Rs 29.20 crore against Rs 24.79 crore. Equity dividend has been stepped up 5 points to 40 per cent and is covered 2.20 times by earnings as against 2.14 times previously. The board has also recommended issue of bonus shares on a one-for-one basis by capitalising a portion of free reserves.

The total inflow in foreign exchange of Rs 56.13 crore represents 16 per cent of the company's net sales. It covers the company's foreign exchange outflow nearly five times, foreign exchange outflows during this period being Rs 11.30 crore. After taking into account Rs 66.4 crore generated by serviced hotels in the Welcomgroup chain and Rs 6.70 crore representing company's promotional and marketing efforts to export products of the small scale sector, the grand total of foreign exchange generated by the company aggregates Rs 69.47 crore, a growth of 32 per cent over the previous year.

Demand for the company's leading brands of cigarettes continued to be strong. The company stepped up investment in extensions and in R and D to ensure that the right quality and types of tobacco are grown to sustain the export and domestic requirements. An effluent treatment plant was commissioned at Saharanpur factory in UP using water hyacinth as the prime purification agent.

In the hotels business, Welcomgroup registered a 20 per cent growth in turnover despite increased competition. Work is apace at the Welcomgroup Nedous hotel in Srinagar to restore the property to its historical and architectural charm before the scheduled opening in October. Construction of the hotel in Jaipur is expected to commence soon. Plans have been finalised for the expansion of the Welcomgroup Mughal Sheraton by another 65 rooms, and the Welcomgroup Windsor Manor Sheraton by 100 rooms to achieve economies of scale in the fast growing markets of Agra and Bangalore respectively. Negotiations are in their final stages to take on lease the Ritz Hotel in Calcutta. A memorandum of understanding has been signed with the authorities to open an Indian restaurant in Odessa, USSR.

Agri businesses continue to make rapid progress. Two major products have been launched, that is, different varieties of oilseeds under the brand name of Adarsh in Andhra Pradesh and Sundrop cooking oils in the cities of Visakhapatnam, Madras, Hyderabad, Bangalore and Calcutta.

Sales of packaging products registered an increase of 33 per cent in the turnover of the general trade business. The marketing of the bulk liquid packaging system has met with encouraging response from the edible oil, fruit juice/concentrates and lubricating oil markets.

The company's export of unmanufactured tobacco at Rs 15.45 crore has shown an improvement over the previous period. Export realisations have been keeping pace with inflation. The government's decision to offer flue-cured virginia tobacco a cash compensatory support of 5 per cent from November 1988 is a welcome step.

Exports of extractions and other agri products have shown promise with a turnover of Rs 4.77 crore in the 9-month period. The company achieved strong growth in its software export business with gross billings in hard currencies exceeding Rs 1 crore. To expand this business, the company is exploring the feasibility of setting up a software development centre in India with ability to access the customers' computers abroad through data communication links. Sustained marketing efforts in the US, Europe and Japan have resulted in export earnings of Rs 9.25 crore from sales of high quality hand-woven carpets and marine products. The company exported music records and cassettes to the Soviet Union. Orders for export of cigarette filters valued at Rs 3 crore have been received. The agency services have enabled exports of Rs 6.70 crore from over 200 small-scale industrial units, resulting in a commission of Rs 37 lakh in foreign exchange.

At the behest of the government of Punjab, the company was invited to consider the revival of Punjab Anand Batteries (PAB), a sick company. The board proposes to make an investment of Rs 119 lakh by subscribing for 11.90 lakh shares of Rs 10 each at par in the capital of PAB under a scheme of rehabilitation approved by the BIFR. This investment when made will amount to 50 per cent of the equity capital of PAB.

Commenting on the taxation and excise issues, the chairman J N Sapru has reiterated that the company has always been a responsible corporate citizen and has never evaded payment of any taxes.

* 9 months; ** 18 months.

The excise issue is still to be resolved and he has assured the shareholders that the company will continue to do all that is possible to resolve this matter expeditiously and satisfactorily.

VST INDUSTRIES

Modernisation Project

VST INDUSTRIES has completed on schedule the first phase of the modernisation project of the primary and secondary manufacturing departments, involving an estimated capital investment of about Rs 6 crore. The company is now equipped with contemporary tobacco processing technology. The modernisation of the cigarette-making and packing facilities is now under progress. As a result of the strengthening of distribution and investment in product upgradation, the position of the company's brands has improved as compared to the earlier part of the year, when sales volumes were under pressure as a consequence of the excise taxation system based on cigarette length introduced from March 1987. Volume trends are now encouraging.

The company has shown a better performance during the 18-month period ended March 31 last with sales of Rs 101.58 crore against Rs 62.54 crore in the preceding 12 months and a gross profit of Rs 8.31 crore against Rs 6.63 crore. It may be noted that the profit figure has been arrived at after providing Rs 2.46 crore paid to the excise authorities as a result of adjudication orders passed in relation to earlier periods. This explains the deterioration of profit margins. Net profit is Rs 4.82 crore against Rs 2.80 crore previously. The directors have recommended a total dividend of 50 per cent, as against 29 per cent paid for 1986-87. The enhanced distribution is covered 1.60 times, as in the previous year. The directors have also proposed issue of bonus shares in the ratio of three shares for every five shares held.

CIMMCO

Improved Working Results

CIMMCO, formerly Central India Machinery Manufacturing Company, has shown improved working results for the 18-month period ended March 31 last. It has earned a gross profit of Rs 3.35 crore against Rs 1.36 crore in the preceding 12 months following sales of Rs 175.40 crore against Rs 95.23 crore. These figures show a fair increase in profit margins. Net profit has increased to Rs 99 lakh from a base Rs 2 lakh of last year. The directors have doubled the dividend to 15 per cent which is covered 2.11 times by earnings; last year's distribution was made almost wholly from past earnings.

The textile machinery division's performance has been satisfactory. Apart from manufacturing traditional weaving machinery, it manufactures the well-known Dornier shuttleless weaving machines. The traditional automatic looms have also been modernised by installing a Rapier system for weft insertion, which whilst almost doubling the productivity of the looms, also improve the quality of the fabrics considerably. The Dornier shuttleless weaving machine can find a larger market in India, but for the government's policy of allowing imports of similar new and even second-hand machines.

Performance at the wagon division (and the heavy engineering division) was affected due to a go-slow resorted to by workers for a considerable period to press for their demands for increased wages. Matters have since been resolved and production is expected to reach higher levels this year. It is intended to update the manufacturing facilities to achieve these ends. The division continues to maintain its lead in special wagons required for specific needs such as for bulk material handling, LPG and for defence. The execution of orders by the heavy engineering division increased in the later part of the year and this trend is expected to be maintained. With the backing of a strong marketing and engineering team, new product lines are continuously being added and sizeable orders have been secured in the chemicals and steel plant sectors. The company is awaiting government approval for setting up a joint venture for manufacturing heavy fabricated valves in association with Zimmermann and Jansen of West Germany. The steel foundry and shuttle divisions continued to perform satisfactorily. The forging division discontinued its arrangements for job processing.

Xpro India, which had afforded the company a field of diversification into plastics processing, greatly improved its overall performance by doubling its annualised turnover. The performance of Cimmco International, a recognised trading house and a division of the company, has been commendable. Its exports exceeded Rs 50 crore compared to Rs 17 crore in the previous year. Further intensive efforts are continuing by entering new markets and, where found feasible, by setting up captive export based manufacturing units. One such unit to manufacture shoe uppers is already being set up at Noida in UP. This will go into production before the end of the current year. The company proposes to participate as a joint venture partner in a project for pineapple processing and export in Vietnam.

IN THE CAPITAL MARKET

BEE Electronic Machines

BEE ELECTRONIC MACHINES, manufacturing plain-paper copiers under the brand name of BEE-CANON, is entering the capital market with an issue of 12 lakh equity shares of Rs 10 each at a premium of Rs 10 per share. The company, known for its quality products, is promoted by K K Bharghava, chairman of Video Electronics, manufacturing CROWN TV sets. The collaborators, CANON of Japan, need no introduction; they are the world number 1 in cameras and plain-paper copiers. BEE Electronics Machines, an existing dividend paying company, has its plants at Tarapur, SEEPZ, and Dahanu Road, all in Maharashtra. The company has marketing arrangements with Remington Rand India, Dynarox Electronics and Chougule Industries. The company exports around 40 per cent of its production. Soon the company will undertake an expansion programme worth Rs 2.4 crore to double its installed capacity from 3,000 copier machines per annum to 6,000 copier machines per annum and to upgrade the technology to impart features like both sides copying, double colour facility, etc. In the near future it may enter the FAX manufacturing line also. The company has come out with the public issue to finance these projects. The company's share capital is Rs 170 lakh (after accounting for the 12:1 bonus issue prior to this public issue) with a revenue of Rs 300 lakh. The book value and EPS are Rs 27 and Rs 8.5, respectively. The projected turnover for 1989-90 is Rs 30 crore which is likely to ensure an EPS of Rs 6 on the enhanced capital. Comparing these figures with Modi Xerox, the giant in this sector, BEE Electronics scores a very high rating for its small equity base, higher earnings and high book value. However competition is heating up in this sector as seen by the recent advertisement wars between HCL and Modi Xerox. The issue opens on July 24.

Knitting Industry in Tamil Nadu

The article 'Dynamics of Capitalist Labour Process: Knitting Industry in Tamil Nadu' (*EPW*, June 17) is part of my research work being pursued under the supervision of Professor A M Shah in the Department of Sociology, Delhi University, Delhi.

—C Krishnaswami

Idle Thoughts on Idle Laws

Arun Ghosh

OVER the years, in diverse capacities in the union government, I have had occasions to amuse myself by penning lampoons on various facets of administration, during long, desultory conferences with endless meaningless speeches made by all and sundry. The following piece, written in March 1981, is reproduced here in response to many letters I have received on the piece appearing in the Annual Number of the *EPW*, on the history of economic thought. My apologies, in advance, to those who dislike frivolity.

I

The law provides that you may deem
Anything to be what it is not.
It is a simple matter it would seem
To sanctify a lot of rot.

II

Pity the poor 'undertaking'
In the MRTP Act,
It is not a legal unit, making
A fiction of an established fact.

III

Yet that is what the law doth say
But the Sachar Committee sayeth more
'Claims' are goods, in law you may
Deem shares as goods, as a legal lore.

IV

But why shouldn't shares be goods, forsooth,
If 'claims' can be bought and sold?
If bearer bonds be legal tender
And not illegal gains to hold?

V

The law's an ass, you think, but no,
The arms of the law are poised to strike
The poor, the weak, the unletter'd dolt
For whom it has a fierce dislike.

VI

The MRTP Act, behold,
Contains not wealth nor 'concentration',
Restrictive trade it cannot hold
Except in people's imagination.

VII

But how, you ask, yet it is easy,
Approval doors have golden keys,
There is yet room for the sleazy,
The crook, the knave, the busy bees.

VIII

The lawyers also serve and wait
Until a battered client appears,
It's never too early nor too late
If you have the cash you have no fear.

IX

The prize to him who can buy his peace,
The prize to him with an open purse,
To him who knows the going rate,
To him with funds to disburse.

X

Long live the vagueness of the law,
Long live the Company Law Board,
The lawyer can always find a flaw,
For those with cash, ahoy, all aboard!

XI

Long live the legal mind that can
Weave a magic spell around the law,
MRTP notwithstanding—
The consumer's in the hoarder's jaw.

XII

In fact, MRTP helps
By holding up all projects, schemes;
Investors, please invest abroad,
Inflation's on, have pleasant dreams.

XIII

He liveth best who cheateth best,
And he cheateth best who cheateth all,
Fork out the cut, and be blest,
And life for you can be a ball.

XIV

But pray, dear reader, have no fear,
Confusion may in the short run spread,
But milk and honey for all would flow
In the longer run, when we're all dead.

* * *

For the more serious minded readers of the *EPW*, here are some Idle Musings on Not-so-Idle Events.

The history of human civilisation has been a tortuous one; mankind has never steadily developed linearly or otherwise. In fact, the growth of mankind has not followed any pattern; many advanced civilisations have been known to perish (and to disappear from the face of the earth) under the assault of barbarians. The Incas, the Aztecs, the Mayas of Latin America, the Sumerians and the Egyptians of the Middle East, the ancient Chinese, the ancient Indians in Mohenjo Daro, Harappa, Hampi and elsewhere, their civilisations have all vanished, some under attack from more virile barbarians, some from other causes—as, for instance, lack of water owing to shifting river beds—not fully explained by recorded history.

So it is with the world today. On the one side, witness the fantastic growth of science and technology such that the progress of humankind (in these directions) during the last fifty years may be said to have surpassed the totality of human progress ever since the dawn of civilisation. On the other hand, witness the development of society, of human relations, of social, political and economic organisation of the human kind, and more than three quarters of the world may be said even as of now to have barely emerged from the Dark Ages. Some countries which had supposedly thrown off the yokes of past bondage (of one section of the population to another), have apparently developed new forms of social oppression.

The events in China in the recent past have been bewildering, to say the least. I am neither a China expert nor a China watcher. But no one can deny the social and economic transformation achieved by China in the forty years since 1949—a transformation of which the Chinese as a people can be proud, a transformation which we in India have certainly not been able to achieve. But then, we as a people have an infinite capacity to fool ourselves, a trait which has direct relevance to the media reaction in India on recent events in China.

Doubtless, the recent events in China have been tragic. One does not quite know the origins of the recent troubles. It would appear from a distance that there was too precipitate a move in China towards Gorbachev's *perestroika* without Gorbachev's *glasnost*; perhaps a socialist economy with a highly centralised production planning regime requires *glasnost*—greater awareness, greater political maturity all round—before it can successfully tackle the problem of economic restructuring. The incentives system of a capitalist economy cannot be suddenly introduced under socialist production relations, without a lot of forethought, planning and deliberation, in fact without general understanding and consensus on their implications, and therefore on the degree and manner of their introduction. This is perhaps one reason for the slow progress of *perestroika* in the USSR.

It is also possible that in China today there are some differences in the perception of the urban and the rural sections of the population in regard to future developments; the PLA is known to be rural-based, whereas the Beijing students in Tiananmen Square represented a growing urban desire for greater 'socialist democracy', which calls for internal political discussion and debate. Anyhow, the position in China is not clear, nor why the mandarins of the Chinese Communist Party—led by Deng Xiaoping and Li Peng—decided on a crackdown on the student demonstrators, since there is no evidence that the students agitation in Beijing was of the nature of an "anti Revolution" movement; it was, it seems from a

distance, essentially a demand for greater *glasnost* of the Gorbachev variety, which is not necessarily antithetical to socialism.

Whatever has been happening in China is not easily understood. In a way, the demand of the students for greater democratisation comes at a level of socio-economic development where the Chinese people have already pulled themselves up from centuries of darkness and degradation. The Chinese people have, in a period of barely forty years, put starvation, rank inequality and human degradation behind them. The demand of the Beijing students for greater democratisation of their polity in this background marks a qualitatively different type of development from the mere grant of political suffrage and voting rights to large chunks of totally deprived people in, say, India. But this demand for democratisation in China does *not*, I think, harbinger the end of socialism in China; it only presages a higher, finer form of socialism. This is where some of the newspaper comments on the significance of the recent events in China appear to be bizarre. The 20th century is *not* likely to mark both the beginning and the end of socialism, but merely the beginning; indeed, Marxian thought envisages the "withering away of the state" which implies essentially the withering away of the state as a repressive agency. This demand is not likely to die in Tiananmen Square, but to resurface and to gain acceptance as time goes on; only, it will not spell the end of socialism in China.

The really tragic part of the story is that in some sense, every regime which feels itself beleaguered appears to react violently. There is, in essence, no good reason why a socialist country should be afraid of a popular movement. This is where the tragedy, the problem of vested interests begins to arise. One hopes the problem would resolve itself in China soon. Anyhow, in this sense the developments in China—the repression that has occurred—is a backward step for the history of socialism generally and for China in particular.

But then, those of us in India who have been talking of the crumbling of socialism in China appear to have totally misunderstood the import of the recent developments in China. It is not socialism versus democracy; the students in Beijing have been demanding greater democracy within socialism. Anyhow, how much of real democracy have we got in India? Are we all clear as to what democracy means? That it means much more than mere adult political suffrage? Do we have to go back to textbooks on political science to inform our respected media men that India is not really a democracy in substance, but only in mere form? I hardly need elaborate on this point.

But let that pass. I am today not discussing the problem, the problems, of India that is *Bharat*. My concern today is with the tragic events of the last few days in China.

It is possible that the recent events in China are likely to make the task of Comrade Gorbachev more difficult; the example of too rapid a move for *perestroika* in a neighbouring socialist country is there for all to see. Add to that the reported victory of Solidarity (over the Party candidates) in the recent Polish elections, and with Solidarity's almost open allegiance to the Pope, one does not quite know how precisely the Eastern European countries would start reshaping their production relations, production priorities and social relations. However, looking at the problem somewhat diabolically, to the extent that recent events may weaken China, Comrade Gorbachev may cheerfully cut down on the USSR defence expenditure; certainly, Vietnam may have lesser danger from Chinese support of the Khmer Rouge in Cambodia; and China may be more willing to accept at face value Gorbachev's offer of a USSR-China *detente* on their border and in Mongolia. On the other hand, in the matter of *perestroika* at home, Gorbachev's opponents—in particular, Ligachev and his supporters—may well get a shot in the arm from the example of the Chinese experience with restructuring, and with the limited introduction of a market-oriented system within a socialist economy.

Would the recent tragic events presage a change in China's foreign policy? There is a distinct danger of that happening. The recent thaw in regard to Tibet may get frozen; and the ruling elite in China may even lose interest in pursuing *detente* with India, for they have many more pressing problems to worry about.

So far, the official Indian reaction to recent events in China, has been quite correct; we are not concerned with the internal problems of a sovereign nation. That approach is but to be expected. What, however, is bothersome is the barely concealed glee in the writings of quite a few leading Indian journalists, that another bulwark of socialism is now crumbling. First, it should be understood that socialism is *not* crumbling in China. One does not have to support the action of the PLA (or one division of it, for ostensibly another refused to roll down tanks on peaceful demonstrators). But one need not also conclude that the students' agitation in Tiananmen Square was anti-socialism, for the students were ostensibly agitating for greater internal democracy within the socialist system. It is not as if the students have been agitating for a faster switch-over to a market-oriented production system. In fact, to the extent that Comrade Deng Xiaoping has been attempting to force on the Chinese economy the introduction of market signals and production oriented to meeting market demand in a socialist economy, he is trying to suddenly impose on the Chinese people a South Korean or Singaporean type of dictatorial market system. A change of this sort requires a great deal of deliberation and careful planning;

in fact, market signals are to act only as a corrective to faulty planning. Otherwise, one would move on to a system akin to market fascism.

It is interesting in this connection to note that the capitalist system does *not* have to depend on democracy. The most successful capitalistic producers in the world—pace South Korea and Singapore—have not been shining examples of democracy. On the other hand, socialism envisages, in the final analysis, the highest form of democracy.

Where does all this lead us in India? One has to remember in this context the basic differences between some of the successful political democracies of the west—all developed countries—and the over-populated, poor countries of the south (with a steadily growing population), all of which face unemployment, low productivity, low output, low savings, low capital formation and inadequate capital equipment per worker. And many of these countries, pursuing the capitalist mode of production, are supposed to be political democracies. But are these countries democracies in the true sense of the word? Does the growth rate, the living conditions of the people, justify the acceptance of the social, political and economic system of these countries? And the success stories among the Newly Industrialising Countries (NICs) of the south, viz, South Korea, Taiwan, Singapore et al, are they, any of them, really democratic countries? South Korea has been having democratic stirrings lately, and its growth rate has fallen sharply as a result.

What, then, is the rationale for our media men hailing the recent events in China as harbingers of the decline of socialism and of the ultimate superiority of the capitalist mode of production? Apart from a few isolated examples, has the capitalist mode of production resulted in the greater welfare of all peoples? Was the example of China's socialist development between 1949 and 1989 any the less spectacular and praiseworthy?

Should we not, in the event, seek to emulate some of the social, political and economic reforms that led to China's spectacular growth between 1949 and 1989? Land reform is one of the basic reforms in that context, to which we have paid lip service so far. Greater egalitarianism, and employment for all, is another. But these call for political and social changes. Are we ready for them? Would we, as a people, be worse off if we were to vote for such a system?

We do not know what is really going on in China. One is certainly saddened by the recent developments there. But let us hold our horses before we pass any judgment. And who are we to pass judgment anyway? Is our own economy, our polity today such that we can be proud of it?

POTOMAC MUSINGS

History Unmade

Deena Khatkhate

With these headlines and datelines galore on mass protests in the communist world, you now see the communists in the capitalist world making a bee-line for exits. For them getting on in the world is the political equivalent of getting out of the world they have known before.

THE events have been unfolding in communist China with the ferocity of a typhoon. Is history being made, we may credulously ask. No, history is being unmade. First a trickle, then a flood, that swamped the human landscape of China. Students leaving their cloistered, suffocating campuses mustered in strength in Tiananmen square, but unlike their forebears in the era of red guards, they did not destroy the homes, make a bonfire of books, mutilate the bodies either of their elders or their peers. They stirred up the spirits of their countrymen, roused their conscience, impregnated their inner urges with a new message. But like the red guards of yore, they shook up the apparatchiks with 'fat bottoms'—that is the only graphic phrase of Mao Zedong that they mouthed approvingly. They left poor Marx far behind, even Hegel, but echoed Nietzsche's philosophical dictum that "God is dead, god remains dead, and we have killed him."

Certainly god was alive before—the god that monitored the progress of the fight against oppression and social inequity during the Long March could not have remained dead. What is true is that someone killed the god. Who could that be? Not the students of today who have heard about the Long March only through their leaders. Perhaps none would ever know. In the godless world of China, the students have coined a new slogan. "Law and democracy, not food and security." We neophytes in the art of living and politicking cannot figure out the language, much less grasp its hidden message. Communism, we thought gives you security and food which the depraved of the world clamour for. But who can understand what communism is? It is like mathematics, as Bertrand Russell said long ago, "A subject in which we never know what we are talking about nor whether what we are saying is true". The generation of Chinese students after the marauding red guards of the 1960 invaded their seats of learning may have not have known what mathematics is all about, but they certainly understood its language and mysteries. They may have told themselves that they "have been with their people where to its misfortune their people were". They braved the army unleashed by Deng and Peng Li and almost co-opted it in their quest for a consciousness of freedom.

But who is their hero? Aristotle? Plato? Rousseau? Jefferson? Abraham Lincoln? No. It is Mikhail Gorbachev until recently a cog in the mighty Russian apparatus. But why Gorbachev, who is a toddling babe in this game of democracy? Gorbachev is a member of their family, their fraternity and what he says has a certain air of *de ja vu*. He is facing the same problems which the students want their leaders to face. You liberalised the economy, you may have increased output but who is enjoying the fruits of this liberalisation? They are telling the puffed-up leaders, if leaders they can be called, that economic liberalisation without political reforms, giving them voice in determining their future, is hypocrisy without limitation. Gorbachev sensed it, by assaulting first the citadel of power. He may have figured out that by providing outlets to the inner frustrations of his people bottled-up over the last seventy years, he would take the heat off their grievances. Consciousness of freedom is for them more precious than consumption of goods. The students may have reckoned that if they want to learn, they should learn from someone like them, facing problems the like of which they face. Friends in adversity are true friends. The Chinese leaders did not discover this truth perhaps because they could not get over their addiction to the world of Confucius, inscrutable, enigmatic and devious.

And yet the enigma of arrivals and departures of the rebellions across the communist world leave one cold. A few years ago it was Yugoslavia, and now a long queue—Hungary, Poland, China and finally the original crusader, Russia. What has gone sour? Did they take a detour to the communist millennium by skipping the stage of full-blown capitalism? Like a traveller on a train who is overcarried, these communist states may be retracting to the stage they skipped. The Russia of Lenin was a country of incipient capitalism; in the Marxian lexicon, there was no flowering of capitalism which could be a springboard for a leap to communism as a tranquil station in social evolution. Chinese society on the eve of the communist revolution was feudal and leaders like Mao were patri-familial, bossy, authoritarian. Many of the production relations may have been ill-synchronised with the evolving social relationships in new societies. It is somewhat curious if not inexplicable that the two countries which so far have been immune to the revolutionary brouhaha are East Germany and Czechoslovakia, both of which had well-advanced capitalist mode of production before turning communist. Could it be then that capitalism has remained a forbidden fruit for the generations born in communist societies, so that at the first symptom of

overt opposition, the whole superstructure of communism comes crashing down?

Or else could it be that the social and political institutions of communist societies were not in congruence with the enormous technological innovations that revolutionised the techniques of production, information network, mass communication, negating the impact of the instruments of power wielded by the communist state? If you know what goes on across your frontiers, you crane your neck to see how you stand in relation to the one beyond. Fred Hirst apparently outwitted the mighty Karl Marx. Man as much aspires for 'positional goods'—what he is in relation to others—as for material goods. It is this informational revolution that probably hastened the demise of a communist state with all its appealing egalitarian gospel. And yet Marx lives amidst the ruination of his empire. His vision that the mode of production determines the social and political relations remains valid. Only that the nature of those political and social relations and institutions eluded the lesser leaders of the communist states. In an age when, and in a world where, the technological frontiers are advancing so much and so fast, there ought to be a matching progress in the design and concept of social and political engineering if both production conditions and social relations that surround them have to move in step.

Yes, democracy has outsmarted communism as a way of life but not for what Toynbee divined some thirty years ago. In a great divide between the monolithic communist society and the pluralistic democracy, Toynbee presaged in terms of his idiom of challenge and response, that the communist society would succumb not to the consciousness of freedom or to the insatiability of man's unlimited wants, but to the undefined virtues of Christianity. "The relationship of the other spiritual forces of our time would be the only effective response to aggression, and would be decisive in creating the future of our civilisation." But the challenge that the communist states faced is not a challenge posed by religions so much as by the libertarian instinct of man.

With these headlines and datelines galore on mass protests in the communist world, you now see the communists in the capitalist world making a bee-line for exits. For them getting on in the world is the political equivalent of getting out of the world they have known before. Here comes a leader of the Italian Communist Party, Achille Occhetto dead set to change the image of a communist in the western eyes. Visiting United States to ingratiate himself with its politicians, he has been saying that his party and he are about to banish the word "communist" from their party. He did not mince words: "Our party is not a member of a patrician political-ideological camp. It is not part of the so-called communist camp. On the contrary, I maintain that there is no longer a real communist movement and the traditions we represent are our own. We want democracy, no longer as a means to achieve socialism but to achieve democracy as a universal end in itself."

In this great metamorphosis of a communist, Occhetto is not alone. The fever is catching. And yet what Gorbachev and Zhao and Occhetto are saying through the roar of the Chinese students is not new to many in India. The same clarion call was given by an Indian who was a member of the Second International, a comrade of Lenin and first a comrade of Mao and then his adversary, Manavendra Roy. At the end of his long journey, forlorn and forgotten, he lived in lonely splendour ruminating that "Man is and should be a measure of everything."

J and K Panchayati Raj Bill
A Critique

Balraj Puri

The Jammu and Kashmir Panchayati Raj Bill passed by the state legislature not only falls considerably short of the measure of devolution that is proposed under the 64th Amendment of the Constitution for the rest of the country, the process of devolution is matched by extension of bureaucratic authority at every level. Lack of trust in the people is the only plausible explanation for the type of law the state has passed.

THE Jammu and Kashmir Panchayati Raj Bill was passed by both houses of the state legislature barely a month and a half before the prime minister of India introduced the Constitution (64th Amendment) Bill in parliament on May 15 on the same subject. The latter bill authorises the state legislatures to enact laws about panchayati raj institutions while giving constitutional sanctions to their powers and functions. Even after the passage of the central bill, the states need to pass their own laws. As on account of Article 370 of the Constitution, the central bill does not apply to the state of Jammu and Kashmir, it had in any case to pass its own law without having to conform to the new constitutional provisions on panchayati raj.

Moreover, the peculiar multi-ethnic, multi-linguistic and multi-religious character of the state necessitated variation from the uniform panchayati raj pattern being proposed for the rest of the country. The thrust of the case for panchayati raj elsewhere, for instance, is on devolution of power and providing a sense of participation to the people; in Jammu and Kashmir state, it has all along also been conceived as an instrument of accommodating its wider diversities.

How far does the law of the state meet its peculiar needs and how does it compare with the proposed national pattern in its devolutionary content?

The Background

References to the panchayati raj system are found in the policy statements of the political parties and leaders of the freedom movement in Jammu as well as Kashmir. It, for instance, finds a prominent mention in the *New Kashmir*, the political manifesto adopted in 1944 by the National Conference, which spearheaded the freedom movement in the Kashmir Valley. Article 45 of the document defines people's panchayat as organs of the state power in districts, tehsils and villages. Its activities cover "maintenance of state order, observance of laws and the protection of the rights of citizens, local economic and cultural development and civil defence.

As the National Conference was essentially a movement of regional nationalism of Kashmir valley for which it demanded the right of self-determination, separate from the rest of the state, its manifesto did not adequately deal with the inter-regional problems. But after Sheikh Abdullah's return to power in 1975, following his accord with the government of India, need was felt to take cognizance of the existing realities and redraft the manifesto accordingly. The task was assigned to the present writer whose draft was unanimously adopted by the National Conference in 1976. It declared: "In order to respect regional personalities and accommodate their respective needs and sentiments, the party... proposes to reorganise the internal constitutional set-up of the state which would provide regional autonomy and further decentralise political power through appropriate institutional arrangements at the district, block and village levels."

It is obvious that this concept of decentralisation was directly related to its integrating role and covered all levels from region to village. For devolution of power at various levels alone could give assurance and sense of belonging to various ethnic and religious communities in a state which has a unique chain of wheels within wheels, i e, a Muslim majority state within a Hindu majority country, a Hindu majority region within a Muslim majority state, Muslim majority districts within Hindu majority region, Hindu majority blocks within Muslim majority districts and Muslim majority villages within Hindu majority blocks.

In recognition of these realities, the J and K State Poeple's Convention, convened and presided over by Sheikh Abdullah and attended by almost the entire political spectrum of the Kashmir Valley, unanimously adopted, on October 8, 1969, a five-tier constitutional set up for the state which aimed at "widest possible decentralisation of power of regional, district, block and panchayat levels, without jeoparadising the integrity of the state".

On the eve of his return to power, Abdullah sought the co-operation of the representatives of Jammu and Ladakh at a convention in Srinagar in August 1974 on the basis of the decentralised polity adopted at the People's Convention. When he became chief minister of the state in February 1975, he repeatedly declared his intention to appoint a commission of experts to work out details of the five-tier constitution. Somehow, he never implemented his declarations.

One of the first announcements of his son, Farooq Abdullah, after resumption of power in November 1986 was to appoint a five-member commission headed by the present writer to implement the assurance of his father. The terms of reference of the proposed commission, as conveyed to me as its chairman designate, were as follows:

> With a view to strengthening the unity of the state and its secular basis, improving inter-regional relations, ensuring sense of participating and equitable share in power and development to all sections of the people, the commission is required to make recommendations for:
>
> (1) appropriate measure of regional autonomy and further devolution of power to lowest unit of administration; and
>
> (2) any other measures to remove tensions and irritations between the regions.

While Farooq Abdullah, too, eventually wriggled out of his commitment to appoint the commission, it is clear that the entire debate on decentralisation of power in Jammu and Kashmir state kept its integrating role in focus and gave equal importance to all the four tiers within the state. The focus of the debate on panchayati raj in the rest of the country has mainly been on its democratising role but there too it has been regarded as a federal continuum, i e, part of the process of transfer of power from centre to states and lower tiers.

Threat to Regional Identity

The terms used since the Balwantrai Committee recommended it in 1959 signify much more than the system of village panchayats which was traditionally in vogue in India. It is a logical extension of the federal system of the centre-state relations, under the Constitution, to units within the state. Judged by this criterion, the J and K Panchayati Raj Act of 1989 does not satisfy the spirit of panchayati

raj. For, contrary to all declarations of Sheikh Abdullah, his son Farooq Abdullah and their party, National Conference, the regional tier is conspicuous by its absence in the new law.

Just as leaders of many states have expressed apprehensions that the central law on panchayati raj might erode the identity of the state and thus undermine the principle of federalism, similarly people in the regions, particularly in Jammu and Ladakh, can genuinely fear that the panchayati raj law of the state might undermine their regional identity and thus lead to centralisation of power. As in a state like Jammu and Kashmir regional identifies are the main cementing force among various communities, their erosion would automatically force communal alignments on the people and weaken the secular basis of the state.

The J and K panchayati raj enactment thus does not serve the interest of integration as the concept was supposed to do. As far as its devolutionary role is concerned, it would also be found wanting as compared to the pattern of panchayati raj envisaged in the Constitution (64th Amendment) Bill.

In giving prominence to the district, the state law would seem to conform to the proposed national law. In fact constitution of the statutory district planning and development board, as a part of the panchayati raj, is a new innovation in the state. For though the district boards do exist in the state, they have no statutory authority. The previous law, Village Panchayat Act of 1958 (which was last amended in 1973), merely provided for two tiers, i e, village and block. However, while the Constitution (64th Amendment) Bill in parliament provides for direct elections to panchayati institutions at all levels, not a single member of the district board, under the state law, shall be directly elected. Its chairman shall be nominated by the government. Other members include chairmen of the block development councils, town area committees and municipal council in the district and MLAs and MPs would be ex-officio members of the district board. Though they are elected, it is well known that voters often choose different parties at local, state and national levels as the issues are different at these levels. Members of the assembly and parliament, in their capacity as members of the district boards, cannot therefore be said to represent the wishes of the people. In many states where MLAs and MPs are members of the district boards, they have no voting rights. But under the J and K law, they shall have these rights also.

Executive Authority with Officials

Further, the executive authority of the district boards, in the state law, entirely rests with the government officers. For according to the law, the district development commissioner shall be the chief executive of the district board and shall be assisted by the district level heads of departments in discharge of their functions as such.

At the block level also, unlike the central bill, the state law does not provide for direct election of any member. It shall comprise of sarpanches of halqa panchayats and chairman of the marketing society within the jurisdiction of the block. The provision for election of the chairman of the block council by an electoral college of sarpanches and panches of the panchayats in that block was added at the final stage of passage of the bill in the assembly. The original draft had provided, like the central bill, for direct election of the office-bearers of the block development council. The draft which had provided for a directly elected secretary was further modified in the assembly to make the block development officer ex-officio secretary thus bringing the block development council also under the influence of the government. The government shall also have power, under the law as passed, to nominate two members to give representation to women, scheduled castes or any other class. The central bill provides for 33 per cent reservation for women and, according to the population ratio, for the scheduled castes but it does not provide for any nomination at any level. The state law provides for nomination but not reservation. Further the term other class is so vague that it can be used by the state government to nominate any person on the block council to represent it.

It is only at the halqa panchayat level where all members shall be directly elected. But even at this level, a government employee, i e, the village level worker, shall be the member-secretary who shall thus ensure government presence at the base of the panchayati raj system. Moreover, the government shall have the power to nominate two members on the halqa panchayat on the same pattern as it does on the block council. There shall be no reservation for women and scheduled castes. Their representatives shall be nominated by the state government in as arbitrary a manner as it may like.

One more flaw in the state law with regard to the functions of the halqa panchayat is that its members have not been made accountable to the people after they are elected. There is no provision for a gram sabha which could act as a sort of assembly for the panchayat and could meet once or twice in a year to pass the budget and to exercise some control on the working of the panchayat, including the right to pass a vote of no-confidence in it or any of its members and elect new members in their place.

In Karnataka, for instance, the gram sabha is the lowest tier of the panchayati raj comprising all voters of the zilla parishad in a village. It meets at least twice a year to discuss, *inter alia*, implementation of development programmes, proposals for new programmes for development, building up of a 'land army', programme of education and such other matters as may be prescribed.

The issue of supercession of panchayati raj institutions has been agitating votaries of panchayati raj for a long time. One of the major objectives of the 64th Amendment to the Constitution, according to the prime minister, is to prevent "sickness of unending suspensions and dissolutions" of panchayati raj institutions. The J and K state law empowers the government to supercede panchayats for incompetence or default subject to two conditions: (a) a show cause notice shall be served, and (b) period of supercession shall not exceed six months.

The repeated act of 1958 also provided for show cause notice and a provision that "the government may any time within six months establish another panchayat in place of the superceded or the dissolved panchayat". But this did not prevent the government from not holding fresh elections to the panchayats till 1989 which were dissolved in 1984.

Perhaps the use of the word 'shall' instead of 'may' in the present law might make a difference. But unlike the central bill, the state law has not made a corresponding amendment in its constitution to make it constitutionally mandatory for fresh elections to the panchayats within six months.

Further, as provision for supercession of the panchayats by the state governments is analogus to the power of the union government to dismiss the state governments under Article 356 of the Constitution, it should have been obligatory on the part of the state government to submit any act of supercession of a panchayat to the state assembly for its approval in the manner in which the union government is required, under the Constitution, to seek approval of parliament for any action taken by it under Article 356; so that if the power of supercession is misused, members of the assembly get an opportunity to expose and criticise it.

Financial Provisions

A pre-requisite of the success of the panchayati raj system is its financial viability and autonomy. The Karnataka law on the subject, for instance, allocates Rs 10 per person per year residing in the area of the mandal panchayat. Out of this 25 per cent shall be paid by the government to the zilla parishad. Another important feature of the Karnataka act is the provision of the finance commission for the zilla parishads to be set up by the government which would ensure objective allocation of resources. The 64th Amendment to the Constitution also provides for appointment of a finance commission by the state governments to make recommen-

dations for (a) determination of the taxes, duties, tolls and fees which may be assigned to panchayats, (b) distribution between the state and panchayats of the net proceeds of taxes, duties, etc, and (c) determination of grant-in-aid to the panchayats by the states. In UP panchayats have an assured source of income through the allocation of land revenue to them.

The J and K law neither fixes minimum amount of grant-in-aid by the state to the panchayats nor provides for any autonomous machinery for objective allocation of funds. The panchayats have no assured source of income either. The law, therefore, does not ensure financial viability and autonomy of the panchayats and leaves enough financial power in the hands of the state government which it could use arbitrarily to influence the working of the panchayats.

Panchayati adalat is another important feature of the new panchayati raj law of the state. For the modern system of justice is not only very expensive and time-consuming but it is also virtually inaccessible to a vast majority of the rural and far off areas. Panchayati adalats have been used in many states to supplement the formal judicial system by reviving and legitimising the traditional system of justice.

The provision for panchayati adalat in the J and K law should, therefore, be welcome. One should, in fact, like its scope to be widened to include subjects like untouchability, pollution and other crimes against community interest. But it is equally important to protect freedom of conscience and right of dissent of individuals against community prejudices and superstitions.

However, by empowering the state government to nominate members of the panchayati adalat and to remove its chairman or any member, the new law takes away the independence of the institution of justice at the grassroots level. It amounts to supplementing the judicial system and the traditional system of justice, both supposed to be independent of the executive, by a third sector of justice controlled by the state government.

There may be cases of misconduct by the chairman or members of the panchayati adalats which may require their removal. But the power to take action against them should be entrusted to an appropriate judicial authority so that the panchayati adalats become an informal extension of the judicial system and remain immune from the bureaucratic influences. Similarly the authority to appoint members of the panchayati adalat should also not vest with the government. Either the halqa panchayats or a judicial body should have the power to do so.

The new state law has raised a controversey by depriving displaced persons who migrated from Pakistan in 1947 to Jammu and have since settled there of right to vote in panchayats to which they were entitled under the Act of 1958. The ruling alliance might hope to get some political mileage in Kashmir by their disenfranchisement. But as the number of such displaced persons is an insignificant part of the total electorate, their limited participation in self-government at local level in a block or two cannot have any impact on the state politics. The state could, therefore, afford to take a more humanitarian view of the matter and retain the elementary right of these unfortunate persons.

The Jammu and Kashmir Panchayati Raj Act does not accept the jurisdiction of the union Election Commission "for superintendence, direction and control of the conduct of elections in the state" nor that of the comptroller and auditor general of India "for the audit of the accounts of the panchayats" as the 64th Amendment to the Constitution proposes to do for other states of the country.

The autonomy of the panchayati raj system in J and K state from the federal institutions like Election Commission and CAG may not be an unmixed gain in view of the not-so-proud record of either fair elections or of an incorruptible administration of the state. Moreover, the law of the state not only falls considerably short of the measure of devolution that is proposed under 64th Amendment to the Constitution for the rest of the country, the process of devolution is matched by extension of the bureaucratic authority at every level.

Whatever be the case of the opposition to a central initiative for panchayati raj legislation, the J and K government of which the Congress Party is a coalition partner, has used its independent legislation, to which it is entitled under Article 370 of the Constitution, to circumvent constitutional provisions that would restrict bureaucratic control over the panchayati raj institutions elsewhere.

The state is not only independent of the federal institutions like the Election Commission and CAG, it has also not made any amendment in its own constitution corresponding to the 64th Amendment in the Indian Constitution. Such an amendment would not have compromised autonomy of the state but would have protected the interests of the panchayati institutions against bureaucratic encroachments by, say, making re-election of superceded panchayats constitutionally mandatory and reserving a list of subjects in the Constitution for exclusive management by the panchayats.

Vicious Circle

Lack of trust in the people seems to be the only plausible explanation for the type of law the state has passed. Without trying to read motives into the intentions of the ruling parties, the distrust could possibly be attributed to the fact that the peop[le] of a sensitive border state are suppose[d] to be more susceptible to communal an[d] secessionist appeals from across th[e] border. Further, it may be argued tha[t] recognition of regional identities migh[t] threaten the unity of the state.

The second argument is, in fac[t] directed against the identity an[d] autonomy of the states within India an[d] its federal constitution. Enough empirica[l] evidence supplements theoretica[l] arguments to conclusively prove tha[t] federalism ensures unity better than [a] unitary system in non-homogeneou[s] societies. A unitary constitution in [a] diverse state like Jammu and Kashmi[r] within a federal country is in any case a[n] anomalous situation and a source of mos[t] the tensions and problems in one of the most curcial states of the Indian republic.

As far as the first argument is concerned, distrust of the people and regimentation of the sytem are not the best means to wean them away from communal and secessionist propaganda. Distrust, in any case, begets distrust. However, while decentralisation is an essential mesure to promote democratisation and integration, it is not a sufficient condition for them.

In a system that lacks other democratic pre-requsites like democratic temper of the leaders and the people and that lacks other democratic institutions like a balanced and healthy party system, independent judiciary, free press and neutral and competent administration, grievance redressal machinery, fair and free elections and an egalitarian economy, mere decentralisation of institutions sans power would only sharpen instruments of regimentation and tyranny. Likewise, a society that is riven with ethnic and communal tensions would hardly be able to get full advantage of the integrating role of decentralisation and federalism and would be tempted to seek stability in further centralisation.

Whether lack of decentralisation is the cause of decline of democracy and rise of communal and regional tensions in J and K state or undemocratic trends and tensions are the outcome of a unitary constitution imposed on a vastly heterogeneous state and concentration of power are issues of wider debate. But where else could one make a beginning to break the vicious circle, where cause is the effect and effect is also the cause, except by innovating institutional reforms and trusting the people by giving them a genuine sense of involvement and participation. That would require a conceptually different approach, than that of the present state law on panchayati raj, adoption of a federal constitution for the state, withdrawal of some authority of the state government from institutions of panchayati raj and a measure of self-denial on the part of the ruling political leadership.

NTR and the Naxalites

M Shatrugna

Now it is Telugu Desam Party activists, vulnerable to the wrath of the naxalites in the rural areas, who have been urging Rama Rao to put an end to the killing of suspected naxalites in false 'encounters' and to punish law-breaking police personnel guilty of committing atrocities on the people.

THE 30-day 'ceasefire' announced by NTR for the naxalites to surrender their arms and take advantage of government 'rehabilitation' measures skirts the main issue raised by the People's War Group before the killing of the Tadicherla Mandal praja parishad president Malhar Rao on June 10. Malhar Rao was kidnapped by the People's War Group as a reprisal against the arrest of two of their members, Gopineni Ilaiah, area commander of north Telengana region and Rayamallu, an activist, three weeks ago in Hyderabad. The police had not only denied the arrest but as if to prove their bona fides, announced a reward of Rs 10,000 to anyone giving the whereabouts of the two missing persons. According to the PWG, the two were arrested by the police on May 18 near Navrang cinema in the city with the connivance of an ex-naxalite, Chatrapati Sivaji, acting as informer. Subsequently Sivaji was killed by the PWG. The PWG had given four days' time for the police to produce the two activists in public or face reprisals. After the deadline, Malhar Rao's dead body was found on the outskirts of his village on June 10.

During the intervening period, all the bigwigs of the TDP in the district had made unsuccessful attempts to convince NTR of the serious consequences that would follow failure to meet the PWG demand. An adamant NTR not only chided party leaders but also said that the TDP members' threat to leave the party would be of no consequence. The TDP activists who had to face the wrath of the naxalites in the rural areas further requested NTR to stop false encounters and punish law-breaking police personnel. The government's familiar story that the two PWG members had not been arrested (or, more likely, killed in fake encounters) was not believed by anyone as gruesome fake encounter killing of suspected naxalites have become a common feature in the last four years after the Kondapur incident in Kareemnagar in which five naxalites were done to death in fake encounters.

The prevalence of the Disturbed Areas Act in most of the Telengana districts where even a petty police official can arrest and take action against anyone suspected to be 'dangerous', the indiscriminate use of TADA even against innocent persons, the witch-hunt of dissident intellectuals, foistering of false cases and near prohibition of even closed-door political meetings where common people participate do not give much credence to the police theory that they had no knowledge of the whereabouts of the two PWG members. When Malhar Rao's killing sent shock waves down the spine of the TDP leaders and cadres, a visibly shaken NTR, after dilly-dallying for four days, called a meeting to discuss the challenge posed by the PWG.

The five-point strategy set out by NTR after the two-day meet comprised: (1) avoidance of any police or government action directed at the naxalites for 30 days, (2) surrender of arms by naxalites, (3) streamlining of the police administration by keeping a tab on police personnel indulging in 'excesses', (4) a rehabilitation programme to draw naxalites into the 'mainstream', and (5) referring of all 'naxalite' cases to courts. To round off the measures, NTR announced that a five-person committee to be called Zilla Praja Rakshana Sanghams would be established to take note, investigate and report on violence committed by the naxalites and the 'excesses' of the police in the districts, implicitly admitting that there was 'indiscipline' in the police ranks. While the non-official committee is free to take up cases it deems fit, the state government could also request the Sanghams to undertake investigation and report to the government for necessary action. The details of the Sanghams' functions are yet to be worked out, though it appears that they would function somewhat like vigilance committees.

The two-day meeting itself was a one-sided affair with no representative of the naxalite groups being invited to participate in the discussions. Even the so-called representation of the civil rights groups was limited either to non-active and infirm leaders or individuals peripherally associated with civil rights organisations. Their inclusion was thus more like a ritual than a sincere effort to involve civil libertarians in the confabulations. Even recognised political parties (both the 'friendly' and the not-so-friendly ones to TDP) did not seem to have considered the two-day meet a serious affair. No senior leader from any of the parties (barring M Omkar of MCPI) bothered to attend the meeting. It appears that the meeting was called more to extricate NTR from the mess he had got into than to deal with the 'naxalite menace'. As if to balance the 'generous' concessions offered by NTR, the government on the same day released the GO relating to the much talked of 'greyhounds', a crack force of the state police. According to the GO, the 'greyhounds' numbering 886 police personnel drawn from the Andhra Pradesh Armed Special Police (APASP) would be posted in the 'naxalite infested' areas to tackle the 'extremist violence'. A sum of Rs 9.5 crore had been released to meet the expenditure of the greyhounds. The crack force consists of one DIG (Head), one SP, one additional SP, 23 DSPs, 23 inspectors, 70 SIs, 165 head constables and 595 constables. As an incentive for joining the force, 25 per cent of salary would be paid extra. Additionally, each greyhound would be entitled to Rs 231 per month towards ration and laundry expenses and Rs 2,000 per year as uniform allowance. A 'non-officer' killed in action would be entitled to a compensation of Rs 2 lakh. The compensation for an officer is far more attractive, Rs 5 lakh. The greyhound squad would have its own administrative set-up and support services. The squad would be supplied with seven 5-tonne vehicles, 7 mini buses, 7 diesel jeeps, 7 cars, 7 motor cycles and 7 trucks. A specially raised dog squad, an exclusive medical staff and a separate communication network would assist the squad.

How effective is the five-point NTR strategy to 'restore peace' in the state? Stopping of fake encounters, scrapping of the Disturbed Areas Act and TADA, allowing mass meetings without official obstruction, withdrawal of farcical conspiracy cases, respect for civil and democratic rights have been some of the long-standing demands of the political activists and democrats in the state. NTR's much tom-tommed two-day meet failed to discuss, let alone accept, these demands. Thus the two-day meet was bound to be a failure. Exactly the same thing had happened within 12 hours of NTR's 'ceasefire'. The PWG in the early hours of June 14 had burnt down the Ditchpalli RDO office in Kareemnagar as their demand for the release of Iliah and Rayamallu had not been met. A few hours later they unsuccessfully mined a road near Byranpalli in Nizamabad district over which a police party had just passed. After an hour-long exchange of fire with the police, the activists retreated into the nearby forest. They also called for a bundh in the four districts of Kareemnagar, Nizamabad, Warangal and Adilabad on June 15 as a protest against price rise in essential commodities and fake encounters.

Tribal Land Alienation in Andhra Pradesh

T Prabhakar Reddy

In spite of laws prohibiting the transfer of land from the tribals to non-tribals, tribals in Andhra Pradesh have been rapidly losing their lands. Results of a survey of three villages.

SCHEDULED TRIBES (STs), now accounting for about 8 per cent of the Indian population, are one of the principal categories of the 'backward classes', or the historically disadvantaged bottom groups of Indian society. For protecting and promoting their interests, and for bringing them into mainstream society, the Directive Principles of the Indian Constitution have laid down thus:

> The state shall promote with special care the educational and economic interests of the weaker sections of the people, and in particular of the scheduled castes and the Scheduled Tribes, and shall protect them from social injustice and all forms of exploitation.

In keeping with these directives the Constitution has several provisions such as for the appointment of a minister-in-charge for tribal welfare (Article 164); for the administration of scheduled and tribal areas (Article 244); for grants from the union government to the states for the welfare of STs, and for raising the level of administration of scheduled areas (Article 275); for protection and promotion of the claims of STs to services and posts (Article 335); and for the control of the union government over the administration of scheduled areas and the welfare of STs (Article 339).

Of these, the provisions for the prevention of tribal land alienation are by far the most important. Their importance should be only too obvious from the fact that land is the only resource of the tribals, especially in the tribal/scheduled areas. Despite the fact that these provisions have been on the statute for about four decades now, tribal land alienation continues unabated.

This is true of Andhra Pradesh also, where the STs account for about 5 per cent of the total population. Here virtually all the STs (85 per cent) depend on land for their livelihood. While about 36 per cent of them are engaged as cultivators, about 49 per cent are agricultural labourers.[1] The methods of cultivation used by the tribals are mostly primitive (*podu* or shifting cultivation), with the result that the yield is very low. While there have been governmental attempts at educating them about the effective use of land through anti-*podu* committees and so on, these have not brought about any substantial change.

Of the ST agricultural labourers about 50 per cent are landless. The STs constitute the single largest group among the landless agricultural labourers in the Agency Tracts. Under the land reforms schemes surplus lands acquired through the imposition of ceiling on agricultural holdings are expected to be assigned to the landless agricultural labourers. While assigning these lands in these areas preference is expected to be given to STs. But considerable land has still not been acquired, leave alone its redistribution to the landless.

Despite the various land reform measures, exploitative sharecropping is still the order of the day. In the absence of any record of tenancy, in most cases sharecroppers have to face a lot of hardship in obtaining institutional credit and in holding on to their land. Since the bulk of the sharecroppers belong to the STs in the Agency Tracts their formal recognition, official recording and the conferment of legal rights of occupancy and purchase of ownership on easy terms will go a long way towards the socio-economic development of this community.

It is against the above background that the Andhra Pradesh chief minister N T Rama Rao's retrograde announcement of January 24, 1989 repealing Regulation 1 of 1970 has to be received with a lot of alarm. This regulation had prohibited transfer of lands in the Agency Tracts to anyone except a tribal. On August 13, 1979 his predecessor had also deprived the tribals of their rights by passing an executive order for exempting non-tribals occupying up to 5 acres of wet land or 10 acres of dry land in the scheduled areas from the purview of Regulation 1 of 1970. The opposition parties in the state were given three options by Rama Rao: (1) repealing the law, (2) redrawing the list of agency areas eliminating villages where not a single tribal lives, and (3) buying at market rate the land in the hands of non-tribal landlords so that they could go and settle down elsewhere.[2] But strangely, those parties, in particular the CPI, CPI(M), Janata, and Congress also betrayed the tribals by supporting th chief minister's decision.

The reaction of the Tribal Adviso Council, a body headed by the minist for tribal welfare, was in the nature of th fence eating the crop. It also endorsed th decision unanimously, buckling dow under political pressures. Subsequentl the governor who has otherwise a pen chant for picking holes in the actions o the Telugu Desam government has als ratified the repeal regulation.

As in the rest of the country, there no dearth of laws against tribal lan alienation in Andhra Pradesh. Thes legislations provide for stringent punish ment to the defaulters and also for restora tion of the alienated lands to the origina owners.

In fact the earliest law dates to 183 when the British administration enacte a legislation concerning the separation o agency areas from the other areas. Late it had passed the law in the form of th Agency Tract Interest and Land Transfe Act in 1917 with a view to protecting th lands of tribals and regulating the rate of interest in the Madras Presidency. Sec tion 4 of this act laid down:

> Notwithstanding any rule of law or enact ment to the contrary, any transfer of im movable property situated in the Agency Tracts by a member of a hill tribe shall be absolutely null and void unless made in favour of another member of a hill tribe, or with the previous consent in writing of the agent or any other prescribed officer.[3]

In 1935 the government of India passed an act giving more powers to the governor in the governance of scheduled areas. In 1959 after the formation of the now-unified Andhra Pradesh, the state government enacted a comprehensive legislation, the Scheduled Areas Land Transfer Regulation. It is more effective in covering the issues regarding any transfer of land in the tribal areas than the act of 1917. It also included provisions such as restoration of property to the transferer and exemption of tribal property from attachment, etc. But these legislations did not stop the

NOTICE

It is hereby notified for the information of the public that **RAMGANGA FERTILIZERS LTD** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of new undertaking/unit/division. Brief particulars of the proposal are as under:-

1. Name and Address of the Applicant : **RAMGANGA FERTILIZERS LTD**
   2, Western Avenue
   Maharani Bagh,
   New Delhi - 110 065

2. Capital Structure of the applicant organisation :

	Equity (Rs. in lakh)	Preference
a) Authorised	300.00	–
b) Issued and Subscribed	220.50	–
c) Paid up	220.34	–

3. Management structure of the applicant organisation indicating the names of directors including managing director/wholetime director and manager, if any : The Company is managed by the Board of Directors consisting of

Shri. U.S. Bhartia	–	Chairman
Shri. H.S. Bhartia	–	Vice-Chairman
Shri. G.D. Tandon	–	Director
Shri. Maheshwar Prasad	–	Director
Shri. Harshvardhan	–	Director
Shri. A.S. Bhartia	–	Director
Shri. Dushyant A. Dave	–	Director
Shri. Naresh Saluja	–	Director

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : A Division
5. Location of the new undertaking/unit/division : Gajraula, Moradabad Distt, U.P.
6. Capital structure of the proposed undertaking : As mentioned in Sr. No. 2
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:
   (i) Names of the goods/articles and proposed licensed capacity : Nitrochloro benzenes— 10,000 MTA; Concentrated Nitric Acid— 15,000 MTA
   (ii) Estimated annual turnover : Rs. 40.5 crores
8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not Applicable
9. Cost of project : Rs. 12 crores
10. Scheme of Finance, indicating the amounts to be raised from each source :

	Rs. Lakhs
Internal Accruals	80
Public Issue	320
Foreign Currency Loan	200
Loans from Banks other than Financial Institutions	125
Rupee Loan from Financial Institutions	475
Total	1200

Any person interested in the matter may make a representation in quadruplicate, to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days of publication of this notice, intimating his views on the proposal and indicating nature of his interest therein.

FOR **RAMGANGA FERTILIZERS LTD**

(ANAND ARYA)
PRESIDENT

Dated this 15th day of July 1989

TABLE: LAND OWNERSHIP OF TRIBAL AND NON-TRIBAL HOUSEHOLDS

(*Households in numbers, area in acres; percentage in brackets*)

Village and District	Households			Area Owned					
				1978			1988		
	Tribals	Non-Tribals	Total	Tribals	Non-Tribals	Total	Tribals	Non-Tribals	Total
Narnour (Adilabad)	29	9	38	236	27	263	54	209	263
	(76.3)	(23.7)	(100.0)	(89.7)	(10.2)	(100.0)	(20.6)	(79.4)	(100.0)
Boyagutta (Khammam)	26	11	37	131	21	152	65	87	152
	(70.2)	(29.8)	(100.0)	(86.1)	(13.8)	(100.0)	(42.7)	(57.2)	(100.0)
Royyur (Warrangal)	19	7	26	157	32	189	44	145	189
	(73.0)	(26.9)	(100.0)	(83.0)	(16.9)	(100.0)	(23.3)	(76.7)	(100.0)

Source: Tabulated from the field-data.

passing of lands from tribals to the non-tribals. Having recognised the activity of grabbing of lands by the non-tribals the officials did not help the tribals in retaining their lands. Gradually, outsiders who came from other districts captured a substantial amount of the tribal lands, and thereby accelerated the process of land alienation.

The land transfers from tribals to non-tribals is a result of exploitation arising from moneylending operations at an exorbitant rate of interest; and from dubious dealings in the course of trade. The non-tribal moneylenders, mostly upper caste people, who have migrated from other districts generally take a written statement while advancing the loan saying that, if the borrower fails to repay the loan within the stipulated time, he has to dispose of his land to the moneylender only. He has no choice of selling the land to others at the prevailing market rate. This kind of conditional sale deeds are common in the tribal areas of Andhra Pradesh.[4] Inadequate institutional rural credit among the tribal population is one of the important reasons for this state of exploitation. Lack of education is another. The literacy rate of the tribals in Andhra Pradesh is just 8 per cent as against the state average of 30 per cent.

Land alienation in a predominantly agrarian economy characterised by highly skewed distribution of land and adverse land-man ratio aggravates the inequalities in terms of income and wealth. This is more so in the Agency Tracts where the lands are passing into the hands of large landowners. In course of time the process of land alienation has increased and the owners of land (tribals) have become tenants and agricultural labourers. In the result, there has been a major change in their occupational distribution with a sharp rise in the number of agricultural labourers. Their living itself is a serious problem, devoid of minimum facilities such as food, shelter, clothing, etc. The condition of the tribals in the state is pathetic and they are being continuously exploited and neglected by the non-tribals and the government. It is disquieting that in spite of the necessary legislative measures taken by the state the dispossession of tribal lands is still taking place.

With a view to understanding the nature and magnitude of land alienation a random survey of tribal and non-tribal households was conducted in three villages. The results are presented below.

In Narnour village tribal households accounting for 76 per cent of the sample households had owned as much as 90 per cent of the total land owned in 1978. But their land ownership has declined to 21 per cent in 1988, while the land owned by the non-tribals has increased correspondingly (see table). Similarly, in the village of Boyagutta 70 per cent of the tribal households of the sample had owned 86 per cent of the total land in 1978. But it has come down to 43 per cent in 1988. In the village of Royyur tribal households, 73 per cent of the total sample, saw their share of land ownership decline from 83 per cent to 23 per cent.

The various methods used by non-tribals for circumventing the laws for acquiring tribals' lands are as follows: (a) 'benami' transfers; (b) transfer to non-tribals in the form of lease or mortgage; (c) transfers in the name of concubines, and tribal servants who may work as bonded labourers; (d) marital alliance with a tribal lady for the sake of transfer of tribal land in her name; (e) transfer of tribal land in the name of tribals adopted fictitiously; (f) transfer of actual possession of land without any record, in lieu of loan; and (g) encroachment of tribal land by force.

Thus there has been a sharp decline in land ownership of tribal households and a corresponding increase in that of non-tribal households. Most of the tribal households have become landless, and survive only as agricultural labourers and tenants. Hence the prevalence of discontent among the tribes. The main cause of discontent is land alienation. Devoid of land, the only resource with which earlier they earned the little income for their sustenance, political unrest is on the rise in the tribal areas. In this context, it would be pertinent to recall the incident of police firing in Indervelli village in Adilabad district on April 20, 1981 in which 13 tribals were officially reported to have been killed.

The genesis of the problem is the indebtedness of STs which forces them to approach the moneylenders and traders. In the process, they are exploited by the latter resulting in dispossession of their lands. In order to correct this the Andhra Pradesh (Scheduled Areas) Moneylenders Regulation restricts moneylending in scheduled areas and under the Debt Relief regulation all debts of tribals not governed by this Regulation were declared null and void. Despite the various provisions of these legislations the tribals could not break out of the clutches of moneylenders.

By repealing the Regulation 1 of 1970, land transfers to non-tribals will continue in the agency areas and tribals will be alienated further from their land. In the result, tribals will be deprived of the benefits of protective laws and special schemes for their development.

IPKF in Sri Lanka: Superpower Compulsions

A Correspondent

India's decision to stay on in Sri Lanka makes eminent sense when viewed in the perspective of the presumed regional role that this country has prescribed for itself.

IT is no use getting indignant over the refusal of prime minister Rajiv Gandhi to concede to the demand of the Sri Lanka president Premadasa for the withdrawal of the Indian Peace Keeping Force (IPKF) from the island by July 29, the second anniversary of its arrival on the island. President Premadasa is too shrewd a politician not to know the Indian prime minister's domestic compulsions as well as the even more pressing compulsions of living up to the 'image' presented in recent highly publicised reports in the western press about India's achievement of the status of a regional superpower.

There is no denying the sense of immense gratification in Delhi about these 'certificates' on the growing strength of India. Indeed, India's intervention in Maldives and Sri Lanka have substantially contributed to this 'image' of a regional superpower to whose benevolent care the stability of the region could be (and according to some, ought to be) entrusted—though, of course, there are also some apprehensions about the potential of this benevolent regional superpower which would need some watching. Such a combination of admiration and watchful wariness is exactly the kind of 'image' that eminently gratifies the establishment and its apologists in Delhi and other metropolitan areas.

So, India is now having its own version of the Monroe Doctrine, with freedom to intervene in the countries of the region—which, with the recent demonstrated success in IRBM technology, is not going to be confined only to south Asia. Only cantankerous malcontents would point out that none of the stated arguments for not complying with the request of the Sri Lankan president are convincing; on the contrary, India's decision to stay on makes eminent sense when viewed in the perspective of the presumed regional role that this country has prescribed for itself.

The costs of such persistence in the Sri Lanka misadventure are, however, going to be very high. The IPKF was sent to Sri Lanka on the invitation of the Sri Lankan government, to assist that government in maintaining and protecting the territorial integrity of Sri Lanka and also to ensure that the Tamil-speaking minority in the nrth and the est would enjoy a measure of regional autonomy—something incidentally that the Sri Lankan government too was anxious to grant. Having gone there on the request of the Sri Lankan government, one would have thought a request by the same government for withdrawal of these forces should have been enough, especially since the stated objectives of the governments of India and Sri Lanka were the same. Indeed, the request for withdrawal of the IPKF should have been grabbed since it is becoming clear that this country has got into an impossible situation and the rank and file of the IPKF, for no fault of theirs, have simply been led to slaughter in that uniformly hostile environment.

But no: it now transpires that the IPKF was sent to Sri Lanka not to safeguard the territorial integrity of Sri Lanka, then as now under attack by Tamil chauvinists, but in order to protect Tamil lives. Going by this logic, since people speaking one or other of the Indian languages and ethnically similar to Indians live in every other part of south Asia (and even farther beyond), would India send troops whenever and wherever any of these communities is perceived by India to be imperilled? If India can send troops to save Tamil lives in Sri Lanka (and decide to stay put even if the group in order to save which India sent its troops are now demanding that India should leave) should it not also send troops to save Bengalis in Bangladesh, Nepalis in Nepal, or Urdu, Punjabi and Sindhi speakers (all Indian languages included in the eighth schedule to the constitution) in Pakistan?

Some even more pressing domestic compulsions appear to have influenced Delhi's decision to stay put in Sri Lanka. It is now clear that elections to the Lok Sabha will be held almost certainly on October 31, the anniversary of Indira Gandhi's assassination—a day and an occasion ready-made to rouse the worst chauvinistic passions among the people, especially the Hindu majority. Further, this majority which has now been almost wholly appropriated by the communalists in the context of the Ram Janambhoomi-Babri Masjid controversy, has to be wooed back to the Congress(I) fold.

The memories of India's military triumph under Indira Gandhi against the only country against which winning a war matters to the overwhelming majority of Indians—Pakistan—are now only a historical memory; few of the 'youth' so assiduously being wooed by the Congress(I) have any memory of those days whose political mileage was anyway fully secured in 1972.

Since then, it has been a decline; India has not had any notable military victory or even an opportunity to show its military muscle. Siachen has been a stalemate, Maldives was a walkover and the benevolent intervention in Sri Lanka which it was thought would be roses, roses all the way, has now degenerated into a nightmarish quagmire, with mounting casualties. The IPKF is now formally described in Sri Lanka as an occupation army which president Premadasa has threatened to confine to the barracks if it does not leave by July 29.

Indeed, the initial mistake was in getting involved at all either, as publicly stated, in order to preserve the territorial integrity of Sri Lanka or, as it is now being revealed, to protect Tamil lives. For both the Sinhalas and the Tamils are under the influence of two of the most chauvinistic outfits; and India's own tender concern, the Tamils of Sri Lanka, are split into factions each more hostile to the majority Sinhala people.

Over and above all, there is no mistaking the strategic objective of each and every Tamil group in Sri Lanka: the destruction of Sri Lanka as a political and geographical entity, sustaining different communities united by bonds of history and geography.

Straightforward self-interest should have persuaded India not to encourage such a band of potential Pol Pots in Sri Lanka bearing different initials and acronyms against their names, for the ethnic and linguistic mix in India is far more explosive than in Sri Lanka. But then, can a regional superpower pass up such temptations to play god in its own backyard?

Everything in Sri Lanka now points to a developing scenario where increased intervention, at vastly increased human and material cost, is inevitable, and is probably also being actively planned. To counter the threatened confining of the Indian troops to their barracks after July 29, the union government's alter ego Subrahmaniam Swamy has adviced the EPRLF administration in the north to unilaterally declare independence on that day. There is no reason to think that Varadaraja Perumal will not oblige, just as there is no reason to think that Prabhakaran would not have obliged had be been in the same predicament (and possessing the same tactical advantages) as Varadarajan. Thereafter, if the 'prime minister' of 'Eelam' were to seek Indian assistance to defend the 'independence' and 'territorial integrity' of 'Eelam', would more troops be sent to form a permanent presence in the north? Can a regional superpower worry overmuch if Sri Lanka were to go to the United Nations, or boycott SAARC meetings? The TV serial on Ramayana has anyway prepared the Indian public for a full-scale invasion of sinful Lanka by the righteous forces of Sri Rama. And at a pinch, on the platform of patriotism and great nation chauvinism, most of the opposition parties too may be persuaded to join forces.

Green Blues in Europe

Michael Jacobs

The June elections to the European Parliament confirmed that Green politics is now firmly on the European map. We may be witnessing the beginning of a new trend: the replacement of True Blue by a new combination of Green and Red.

EUROPE has a new political colour: Green. In June's elections to the European Parliament one clear trend emerged throughout the continent: support for Green parties is increasing. Raising their vote to between 6 per cent and 15 per cent of the poll, the Greens have upped the number of their so-called 'Rainbow coalition' seats from 20 to 34. With the combined Socialist parties also winning extra seats, and the Communists just about holding theirs, the new Parliament has a Left-Green majority, albeit a slender one, for the first time in its history.

The elections confirm that Green politics is now firmly on the European map. Perhaps surprisingly, the oldest-established Green party, in West Germany, made only a modest gain, from 8.2 per cent to 8.4 per cent, winning one extra seat. But in Belgium Green support rose to 14 per cent, in France to 10.5 per cent, resulting in representation (with nine seats) for the first time, and in Italy it trebled to 6.2 per cent, and six seats.

The most remarkable result, however, was in Britain. From being the smallest Green Party in Europe, the British Greens have rocketed to being the largest. Their share of the vote rose from literally nowhere—last time around, in 1984, they did not even stand in the majority of seats—to an astonishing 14.9 per cent. This average hides, in fact, still more sensational regional results. Across the more prosperous South of England, the party won a consistent 19 per cent or more of the vote, and in six constituencies it actually came second. To put this into perspective: just two years ago, in the general election, the Greens scored 0.6 per cent.

Unfortunately for them, however, the British electoral system of first-past-the post means that the Greens have won no seats in the European Parliament. Labour now has the majority of British MEPs, scoring a morale-boosting 40 per cent of the vote and inflicting on Margaret Thatcher her first ever electoral defeat. The increased Labour and Green votes came not just from the Tories but from the centrist Democrats (ex-Liberals and Social Democrats) whose vote collapsed to 6 per cent.

It would be wrong to read *too* much into the increased Green vote. The European Community's constitution gives the Parliament little power: most policies are initiated by the unelected Commission, with decisions being made by national governments in the Council of Ministers. This makes the European elections a perfect opportunity for protest voting. Moreover the turnout is low—an average of 61 per cent (in Britain, just 37 per cent), so the poll is not necessarily an indicator of national election opinion.

Nor does the result necessarily demonstrate support for the full range of Green Party policies. In Britain, for example, these include unilateral nuclear disarmament (a policy whose alleged unpopularity is currently leading the Labour Party to abandon it), a 'basic income' scheme guaranteeing all citizens a tax-free weekly income from cradle to grave, and the break-up of the nation state into a federation of European regions. It is quite likely that many voters were not aware of these policies at all—itself unsurprising given the negligible coverage given to the Greens by the media.

Environment, the Key Issue

Rather, people were voting for the Greens' stand on the environment. This, however, *is* significant, and it is a portent of a genuine tansformation of politics in Europe. The environment is becoming the key issue of the 1990s, and the voters have (typically) recognised it before the politicians.

In the last few years Europe has been hit by a succession of environmental disasters. The nuclear accident at Chernobyl in the Soviet Union in 1985 sent fallout all across the continent: many governments are still compensating farmers whose livestock is too radioactive to be sold. Acid rain has destroyed a third of Germany's ancient Black Forest and huge areas of Scandinavia, and there are now few parts of western Europe unaffected. A huge chemical spillage in the Rhine last year exposed widespread river pollution, while the contamination of the North Sea by industrial waste dumping suddenly came to public attention when thousands of dead seals were washed up on its coasts. The Mediterranean has for a decade been fighting to retain its sea life. The episode last year of the Karin 'B', a cargo ship carrying Italian toxic waste which was shunted from port to port around Europe being refused entry epitomised the chaos which now passes for industrial waste disposal. The disgraceful attempts to offload such material on to poor African countries has only been halted by assiduous journalistic expose.

Meanwhile, of course, as everywhere else in the world, European public opinion has been alerted to the risks of the greenhouse effect, the depletion of the ozone layer, the destruction of tropical rainforest and other global issues.

It is not only the elections which indicate the extent of public concern about the environment. Throughout Europe—not just in the west but also in the eastern half of the continent, particularly in Hungary and Poland—membership of environmental pressure groups has soared in recent years. In Britain Friends of the Earth and Greenpeace are experiencing annual growth rates of 20 per cent, while in Denmark there are said to be more members of environmental bodies than there are people, since so many citizens belong to more than one. It is hardly possible to pick up a newspaper or magazine or watch television anywhere in Europe without encountering an environmental topic. The latest phenomenon is 'Green advertising', in which large multinational corporations take out full-page press ads to publicise their concern for the environment. The companies are, of course, usually the worst environmental offenders: oil and chemical firms predominate, with British Nuclear Fuels the latest addition.

Perhaps the most interesting development is the growth of 'Green consumerism'. Supermarkets now vie to stock the most environment-conscious products: not just organic and additive-free foods but 'ozone-friendly' (CFC-free) aerosols, recycled toilet rolls and stationery, biodegradable detergents, non-polluting batteries, and so on. Germany now has a special 'Blue Angel' symbol for certified ecologically-acceptable products and similar schemes are in preparation elsewhere. In Britain 1988 saw the publication of *The Green Consumer Guide*, detailing how the Green-minded consumer can use the power of his or her purse to protect the environment ('from shampoo to champagne'): it went straight to the top of the best-seller list.

If astute manufacturers and advertisers are riding the crest of the new wave of Green consciousness, the conventional political parties are paddling along somewhere behind. The Green parties, of course, have been trying the surf for some time. The German Greens were the first to gain parliamentary representation, in 1983, and they have since been joined by Green parties in Switzerland, Austria, Sweden, Finland, Luxembourg, Belgium and Italy. Greens have local representation in many other countries as well, including France and Britain.

One of the most important consequences of this is that Greenness has now swept across all the other parties too. Fearing a loss of votes, all shades of the political spectrum have suddenly declared themselves to be Green. On the Left this has been part of a general shift towards the 'social movements' (women's, peace and ecological) of the last decade. The German Social Democrats (SPD) have probably advanced the furthest, incorporating genuinely Green policies on the environment and other issues (such as

the shorter working week and improved women's rights) into their programme. Indeed in two German states the SPD and the Greens have formed coalition governments.

Conservatives' New-Found Green Enthusiasm

But Green awareness has also penetrated the Right. This was demonstrated most astonishingly by Margaret Thatcher's now celebrated speech to the British Royal Society last September, in which she declared that protection of the environment was now the foremost challenge facing the world, and committed her government to both national and international action in support of it. The prime minister's statement was the more astonishing because Britain under her leadership has had the worst environmental record of any country in Europe. It was, as someone observed, the most remarkable conversion to a cause since Paul hit the road to Damascus.

But however much the Conservatives, throughout Europe, attempt to sell their new-found Green enthusiasm to the public, the advent of the environment as a major issue surely spells an end to the free market politics on which Margaret Thatcher and her allies have stood for the last decade. Put simply, the free market is the *cause* of many of the world's most urgent ecological problems, and their solution is only feasible if the imperatives of the market are overridden.

That untrammelled market forces cannot guarantee environmental protection is not simply evident from their palpable failure to do so up to now. The very structure of (unregulated) markets, in which 'external' costs, such as those imposed on the environment, are not paid for by either producers or consumers, makes ecological degradation inevitable. To take an example much troubling Europe at the moment: it is not car manufacturers, nor car drivers, who bear the cost of lead and other polluting gases from vehicle emissions, it is the children whose brains are damaged, and the future generations who will have to live with the warmer climate and reduced protection against the sun which the emissions (in part) cause. So long as the environment is regarded, as the free market regards it, as a free sink into which the economy's wastes can be poured, its survival must be in jeopardy.

Of course, the introduction of regulations protecting the environment by law—such as the new vehicle emission standards agreed by the European Parliament—does not mean the end of capitalism. Profit-making companies have long been used to regulation of their activities. But it does mean that governments and corporations will increasingly find themselves on opposite sides. Scientific evidence and public opinion will force governments to impose new controls, while companies fiercely resist the inevitable rise in costs (as the motor manufacturers have done for years over exhaust pollution). For Conservative parties such as those in Britain, which have prided themselves on freeing industry from bureaucracy and state interference in the market, this conflict will not be easily mediated.

It will not be a question, either, of the odd new law here or there. The proliferation of ecological problems in the last few years has demonstrated the inalienable truth that all economic activity is founded on environmental wealth. Ultimately all resources come from the environment and all wastes—the end-products of the economy—return there. (Indeed, since matter-energy cannot be created or destroyed, the two quantities are identical.) If the economy is to be made *sustainable*, we have to make sure that we do not deplete resources faster than we can regenerate them or find new ones, nor emit greater quantities or concentrations of waste than the biosphere can safely absorb. This means that not just a few major polluting or resource-using industries but *all* economic activity must be constrained and regulated according to ecological principles.

This message has not yet percolated through to the priests of the free market, but there can be little doubt that it will. Already West Germany and Scandinavia are examining the feasibility of environmental taxation—attempting to 'internalise' external environmental costs by levying taxes on scarce resources. A carbon energy tax, for example, is being proposed as the most effective means of stimulating energy conservation (and power generation from renewable sources) to reduce the greenhouse effect. Several European countries already tax certain forms of waste disposal, and the possibility of wider intervention in the price system to control pollution is under investigation.

Need for Ecological Planning

What is clear is that, whether the mechanism used to achieve it is regulation or taxation, industrial economies will have increasingly to be *ecologically planned*, with targets being set for resource use and waste disposal, and firms compelled to stay within environmental limits. This is not exactly the free market ideal which has motivated western economic policy over the last ten years.

Moreover, such planning will have to be done on an international scale, since so many environmental problems are global in extent. This is not so utopian as it might appear: examples such as the 'Club of 30' agreement to reduce acid rain emissions in Europe and the Montreal Protocol limiting worldwide CFC production already exist. It is clear that an international target for greenhouse gas emissions must follow soon.

The growing need for 'ecological planning' therefore poses an enormous challenge to the European Community, as the only genuinely law-making transnational body in the world. Currently the issue dominating the agenda of the twelve member countries is the introduction of the Single Market—the abolition of all frontier controls on trade at the end of 1992. But the vision of a continent-wide free market, in which huge corporations trade, relocate and employ workers without national restrictions, is coming under increasing criticism. Already the socialist president of the European Commission, Jacques Delors, has put forward proposals for a 'Social Charter' guaranteeing minimum rights for workers and social welfare provision across the Community. Now, as the results of the European elections are assimilated, the calls for a similar 'Environmental Charter' will surely grow.

The 1990s are therefore likely to see a different type of politics from the one that has dominated the last decade. As markets are increasingly regulated according to both social and ecological imperatives, the momentum of Thatcherite conservatism may finally have been exhausted. Margaret Thatcher is already isolated as the only European leader who rejects the Social Charter (she has called it 'Marxist') and who opposes the loss of national sovereignty implied by international legislation on environmental and other issues. Even the Conservative governments of Germany and Holland have recognised that protecting the environment requires new and urgent measures. Indeed, the Dutch government has just fallen on this issue, the Christian Democrats' Liberal coalition partners having rejected proposed new taxes to reduce vehicle emissions.

But as the European elections have shown, voters seem increasingly unconvinced by the environmental claims of even the moderate Right. What we may therefore be witnessing is the beginning of a new trend: the replacement of True Blue by a new combination of Green and Red.

Changeful Society and Changeless Governance

Nirmal Mukarji

With non-Congressism on the rise in the states and the possibility of a non-Congress alternative even at the centre in the air, the civil service will have to learn to be more independent in the political sense. The need for such independence will be all the more if democratic self-governance is extended to the sub-state levels.

OBJECTIVE circumstances in a country change much faster than the ability of its system of governance to adapt to them. What are the major changes that have taken place in India? What modifications do these call for in the country's system of governance? And what implications do these have for the civil service?

I

Foremost among the changes in objective circumstances are demographic changes. From about 350 million at independence, India's population has gone up to over 800 million and is projected to cross the billion mark at the turn of the century. The age pyramid remains as flat as ever, which means that in absolute numbers the young comprise much more than half the total population. People are moving into the cities in larger numbers owing to a combination of pull and push factors. Urban population was about 60 million at independence, rose to 160 million in 1981 and is projected to be 360 million in the year 2001. More than a third of all Indians will be living in cities when that 'glorious' twenty-first century dawns, as against a sixth when we became independent. Economists, planners and the intelligentsia generally view these changes with alarm. There is no question that there is genuine cause for concern. Much, though not all, of the alarm stems from a view that large numbers of people, especially when many of them are young and often aggressively demanding, constitute a liability. If people were to be thought of as human resource and therefore a potential asset, the alarm bells might be less clangorous. Liability or asset, the sheer magnitude of the numbers places a question mark on whether a largely static system of governance can cope with the rapidly expanding demographic reality.

Next are the changes brought about by political development. The central legislature we started with, which also doubled as the Constituent Assembly, was elected in 1946 on restricted franchise. The size of the electorate then in the whole of undivided India, excluding the princely states, was 35 million. Then came Article 326 which provided for universal adult suffrage, perhaps the most impactful clause of the Constitution. As a result the electorate for the first general election of 1952 jumped five-fold to 173 million. The figure became 364 million in the last general election of 1984. With the voting age lowered to 18, it will exceed 450 million for the next general election. The change from restricted to universal franchise thus meant moving from elite to mass politics in terms of numbers. If the masses had remained politically quiescent this would have made little difference. But frequent and regular elections served as schools of political education, steadily raising the level of political consciousness. The successful overthrow of entrenched regimes in several states and even at the centre had the effect of accelerating the process of politicisation. While literacy crawled from 16.7 per cent in 1951 to 36.2 per cent in 1981, political education leapt ahead. Given India's powerful oral tradition, the written word was not needed for political issues to be discussed at tea shops across the country with earthy wisdom.

Changes wrought by economic development are a mixed bag. On the one hand, the country has become nearly self-sufficient in foodgrains. The threat of widespread famine has gone and in fact the possibility has opened up for food security measures to be undertaken here and there, like the provision of subsidised rice to the poor in Andhra Pradesh. Indian industry now produces a wide range of products. Infrastructural areas like power, transport and irrigation have registered good progress, thanks mainly to the public sector. On the other hand, the overall growth rate of the economy until the end of the 1970s averaged a mere 3.7 per cent per annum, which having regard to population increase meant only 1.5 per cent per capita. In the 1980s, growth is claimed to have gone past this 'Hindu rate', as the late Raj Krishna called it, and touched 5 per cent. But much of the increase is accounted for by 'drone' items of the service sector like the bureaucracy and defence. More disturbing is the spread of economic benefits. The top 20 per cent take nearly half of the gross national product, against which the bottom 20 per cent are left with only 7 per ce[nt]. Economic development has created glari[ng] disparity between the rich and the poor. T[he] poor are not only those defined as such f[or] official purposes but in fact all those oth[er] than the rich, i e, four-fifths of the popul[a]tion, i e, 650 million people today.

The picture that emerges from the[se] dimensions of change is one of a vast a[nd] growing population advancing rapidly [in] political consciousness but being ma[de] increasingly aware that the fruits [of] economic growth, meagre as they are, are n[ot] for them but for a chosen few. There a[re] numerous signals that the imbalance be[t]ween expectations and satisfactions, [a] familiar enough phenomenon in mo[dern] societies, is driving individuals and grou[ps] outside the system of governance into a[n] extra-constitutional polity. We need to thin[k] whether and how the system can be give[n] more stretch and flexibility to cope wit[h] discontent. But before coming to that tw[o] of the major changes in the political aren[a] need to be noted.

The more significant is the decline of th[e] once-great Congress Party. In a sense th[e] decline started when Congress came int[o] office, for power began to corrupt. By th[e] time the Nehru era ended the rot had se[t] in, creating in its wake room for non-Congressism to arise. This was of thre[e] types; Left fronts, self-respect movement[s] like the DMK and Lohia-inspired oppositio[n] unity moves to ensure one-to-one electora[l] contests. The result of this emergent non-Congressism was that, in the 1967 genera[l] election, Congress was ousted from powe[r] in eight states. This became a turning point. On the one hand, democracy received a sho[t] in the arm because alternatives to Congres[s] were seen to be a possibility. On the other, a shocked Congress unleashed a formidabl[e] backlash. First, most of the newly forme[d] non-Congress governments were swept aside. Next, since the states had proved to be vulnerable for Congress, extraordinar[y] measures were adopted to centralise power. On the party side, there was a split with the faction in power adopting the 'fuhrer' model, doing away with intra-party elections. On the government side, huge para-military forces were created. The reach of the Intelligence Bureau was extended right across the country and especially to states which persisted with non-Congressism. President's rule began to be imposed more frequently. Economic management and planning were so conducted as to make states increasingly dependent on the centre. Captains of industry, czars of science and technology and indeed all those most favoured by the pattern of development went along happily. The political and economic 'haves' thus made common cause to make the government of the country more centralised than Nehru or anyone else had ever visualised. This was a far cry from the federal democracy the country had opted for.

Correspondingly significant is the rise of countervailing forces. If the benefits of economic development went largely to the top 20 per cent, the gains of political development quietly accrued to the rest of the people. Elite groups corrupted the electoral system to keep themselves in and the masses out. However, when centralisation reached its apex in the Emergency, the masses voted the offending regime out at the first opportunity. They did the same to the successor regime when that failed them. Congress wrongly interpreted this as a mandate for renewed centralisation and paid for this by losing state after state in a series of elections. Non-Congress elements in the states joined hands to demand that the federal structure of the Constitution, overshadowed for long by the command system of the Congress, be restored and strengthened. Federal reform thus came on the national agenda. Meanwhile, the Left Front in West Bengal innovated a bold programme of land reform coupled with vitalisation of panchayats. For the first time since independence, the masses in that state felt the glow of freedom through active participation in panchayat self-governance. What distinguished West Bengal's panchayats from earlier versions was that they were openly political in character. Karnataka and Andhra Pradesh, which too had non-Congress governments, also transformed their panchayats into politically elected units of self-government. The concept of panchayat governments pioneered by these states caught the imagination of the country. Decentralisation below the state level through devolution of political power to panchayat governments thus became an important adjunct of the movement for federal reform.

II

This analysis of changing circumstances points to the need for federal reform and for decentralisation below the state level. Since federal reform in the present context is a euphemism for decentralisation from the centre to the states, the single agenda that stands out is decentralisation.

The critical element in this is finance, because functions accumulate where there is money regardless of constitutional lists. Therefore, when thinking of decentralisation, there will have to be a new financial regime as between the centre, the states and sub-state levels. Obviously the centre must be left with enough for its basic needs. At the same time, the states and sub-state levels, not being in a position to raise on their own the resources for *their* basic needs, must receive assured funds from the centre in sufficient measure and without strings to make purposeful self-government at these levels possible. So far, Finance Commissions have followed a tax-by-tax approach. A new regime which would ensure finality, avoid recriminations and be simple to operate would be for the Constitution to provide for a fixed percentage out of the centre's aggregate resources to go to the states and out of that a fixed sub-percentage to be passed on to sub-state levels. The prime minister was right when he told parliament that untied grants make for local level planning. The opposite is also true, namely that tied grants cripple local initiative, especially if they squeeze out untied grants, for where there are strings there can only be puppets at the other end. Consequently centrally sponsored schemes, the latest in an expanding array being the Jawahar Rozgar Yojana, are essentially antithetical to the idea of decentralised democracy. Constitutionally guaranteed free-of-strings devolutions to state and sub-state levels would lessen the scope for the centre to play centrally sponsored games and correspondingly strengthen democratic governance at these lower levels.

An equally critical element is planning. So far planning has been thought of as inevitably involving centralisation. In a federal polity we need to think of planning as 'national' rather than 'central', and find a way to federalise it. The command system by which Congress ruled during the first two decades after independence could not but infect the Planning Commission. Instead of adopting the democratic route of seeking consensus on major policy issues, it took to imposing its growth models and investment budgets on the states. It was able to do so because it secured control over the distribution of plan funds. Discretionary plan devolutions have been rising against assured non-plan devolutions via Finance Commissions, the present ratio between the two being about 40:60. Planning clearly requir[es] a measure of discipline, but in a democrat[ic] context this should come more from conse[nsus] than from financial coercion. Over-involv[e]ment in preparing investment plans h[as] resulted in the neglect of policy plannin[g]. Vital matters like the oppression inflicted o[n] the poor and the decline of mediatory inst[i]tutions such as the police and the courts a[re] treated by the commission as outside its pu[r]view. Issues like South Asian regional co-operation or the balance between defen[ce] and development are excluded becau[se] foreign policy and defence are regarded a[s] holy cows. Even in the 'included' area, no[t] enough thought goes into problems like ma[ss] poverty, regional backwardness, environ[]mental decay and the criminal neglect o[f] women and children. In a new plannin[g] regime, the Planning Commission woul[d] need to pay more attention to major polic[y] questions and allow investment planning t[o] be decentralised within a framework of na[]tionally accepted policies.

Thirdly, there will have to be a new regim[e] in the districts. We simply cannot go on flog[]ging the 'district officer' system any longe[r]. Today's district officer has been saddled wit[h] far too much to do and as a result is unabl[e] to do anything effectively enough. Agains[t] this, the political awakening of the peopl[e] has led them to expect far more than th[e] system can deliver. The answer surely lies i[n] letting the people run their own affair[s] through elected district governments. If such governments are not to go the way of pan[]chayati raj institutions (PRIs) they mus[t]

ossess characteristics the lack of which led the failure of those bodies. For one, these overnments must be recognised as political ntities, with political parties openly consting elections. For another, they must look fter the totality of district governance, with e district bureaucracy coming squarely nder them. Dividing the task of governance etween regulatory and developmental funcons is artificial and untenable. Further, the ate of district governments must not be left o the tender mercies of state governments. lections must statutorily be held at regular ntervals under the overall supervision of the lection Commission. Supersessions should e barred, for there is no justification for iving state governments a handle to remove nconvenient district governments. Lastly, istrict governments must be nested in the ederal idea, forming a third tier of the poliy. The third tier would subsume self-governing nits at sub-district levels right down to *gram abhas*. The introduction of a third tier must ot, however, squeeze the intermediate seond tier or be seen as attempting to do so.

Fourthly, there will have to be a new egime for urban government, having regard o the fact that urban areas will hold a third f the nation in a mere decade or so from ow. The governance of these areas can be onsidered at two levels. The Asoka Mehta Committee drew attention to the fact that mall and medium towns had stagnaed for decades while the bigger towns had rown steadily bigger. It ascribed the henomenon to the former not having eveloped functional linkages with their ural hinterlands. However, with increased commercialisation of agriculture an urbanural continuum was growing. The committee advocated linking rural areas with urban focal points under the umbrella of PRIs. There is good sense in this line of thought. Consequently, at one level, small and medium towns should be integrated with district governments through some form of federal linkage. The term medium town would have to be interpreted flexibly to include most district headquarter towns considering that they are very much a part of the urban-rural continuum. At another level, the metropolitan and really big cities will need to be treated differently. For they present a major problem of governance, not adequately recognised as such till now because of the persisting impression that India is mainly rural. The National Commission on Urbanisation classified urban areas into cities and towns, the former having population more than one lakh and the latter less. Elsewhere it suggested a two-tier administration for cities with population over 5 lakhs. At yet another place it listed 40 cities which would be more than a million strong in 2001. A practical approach might be to make a beginning with, say, half of these 40 in the matter of installing specialised city governance. Possibly, some initial lessons could be learnt from Calcutta and Howrah which have broken out of the pervasive Bombay corporation model and innovated a mayor-in-council system.

New regimes for finance and planning as well as for district and urban governance would constitute a four-pillar minimum needs programme to bring about needed changes in the system of governance. The four must be viewed as an integrated package. Picking out just one of them, such as district governance, would be like trying to lift a *charpai* by a single leg. This, in fact, is the major defect of the Constitution (64th Amendment) Bill for panchayats. A 65th bill for the urban areas would not cure the defect since the first two agenda items, i e, new regimes for finance and planning involving decentralisation from the centre downwards, would remain untouched.

III

What implications would such a reform package have for the civil service? For our purpose, the civil service means mainly the all-India services but also all Class I services of the centre and the states. The constituents of the civil service so defined have their differences with each other over career issues but are nevertheless a recognisable category, if only because they occupy the commanding heights of the administrative machinery and are for that reason the most influential group within the bureaucracy. The attitude of members of the civil service has been conditioned by two factors. For one thing, they have throughout functioned in a centralised and centralising system of governance,

New Delhi being the prime focus of centralisation but also the state capitals. Secondly, they largely come from urban backgrounds and their educational attainments class them as English-speaking. Somehow the chemistry of this second factor operates to make civil servants generally comfortable with centralism. Thus, exceptions apart, district officers are eager to complete their stints in the field and get to the state secretariats. Those serving in the states, at least a considerable proportion of them, want to get to the centre. The more enterprising of those who succeed in this immediately begin working to get to what for them is the centre of all centres, namely, the World Bank or one of the many UN agencies.

The thrust of the suggested minimum needs reform is in the opposite direction, its essence being downward democratic decentralisation—3Ds—towards more 'vernacular' governance. Therefore, the first implication of the package, if it ever comes about, would be that the civil service would need to do an about-turn in its attitude. Would it be able or willing to do so? We can all entertain our respective doubts. Bureaucracies do have inertia built into them and are resistant to change. But the Indian bureaucracy has shown that it is viscous enough to fit into new political moulds. This was proved when power was transferred from British to Indian hands in 1947, though it must be admitted that the newness of the native mould was more on paper than in fact. It was also proved in the states whenever power was transferred from Congress to stable non-Congress parties. But none of these involved structural change for the civil service. The crucial obstacle for a change in attitude is, in fact, the way the civil service is structured, the highest jobs being at the centre or in state capitals and the lowest in the districts. Successive pay commissions have reinforced this structure rather than change it, because preserving 'relativities' has been their guiding principle. This writer once met a German civil servant who, after having done a term as cabinet secretary to the federal government, had chosen to be a city manager of one of the major cities, presumably carrying his emoluments with him. We need a new kind of pay commission which would free itself from the bind of relativities and allow room for structural changes to take place. The civil service must have enough flexibilty to reverse direction and flow more easily into new moulds of people-oriented governance.

Quantitatively, the civil service and the bureaucracy generally of which it is a part are increasingly viewed as costing the country more than they are worth. Decentralised governance could easily result in the creation of more posts. But should this necessarily mean expansion of an already oversize and largely parasitic bureaucracy? Should genuine decentralisation not mean visibly slimmer central and state secretariats and departmental headquarters? Much praise has been deservedly showered on West Bengal and Karnataka for their panchayat governments, but Calcutta and Bangalore remain as populated by bureaucrats as before. If logic favours smaller bureaucracies at decentralising points, whether at the centre or in the states, could those found surplus to the requirements of New Delhi and the state capitals not be redeployed in the decentralised units of governance?

Qualitatively, at each level of what effectively would be a multi-tiered federation, the civil service would have to subordinate itself to a democratically elected government and yet maintain its independence. Subordinating one's self may present some ego problems here and there but is otherwise easier done than maintaining independence. It sounds trite but is true that an independent civil service is vital for a healthy democracy, especially so in a multi-tiered arrangement. There is a familiar connotation of independence according to which an independent civil servant is one who is fearless in thought, word and deed. Independence in this sense goes with integrity, for the fearless one cannot afford to have anything to hide. Basically independence has to be rooted in values and principles. That being so, there has to be a willingness to face consequences, such as not getting plums or, worse, being harassed in sundry ways. The ultimate contingency of leaving government employment if necessary has also to be faced with equanimity. All of which is not to say that an independent civil servant must wage a running war with elected representatives of the people. On the contrary he must learn to work harmoniously with his political masters without fatally compromising his independence. Happily, there are still many such independent civil servants. But the hard fact is that their number is decreasing. Corruption and collusion with dark forces are taking their toll. If decline is not to turn into decay, it is for the civil service as an institution to rise against these forces while there is still time.

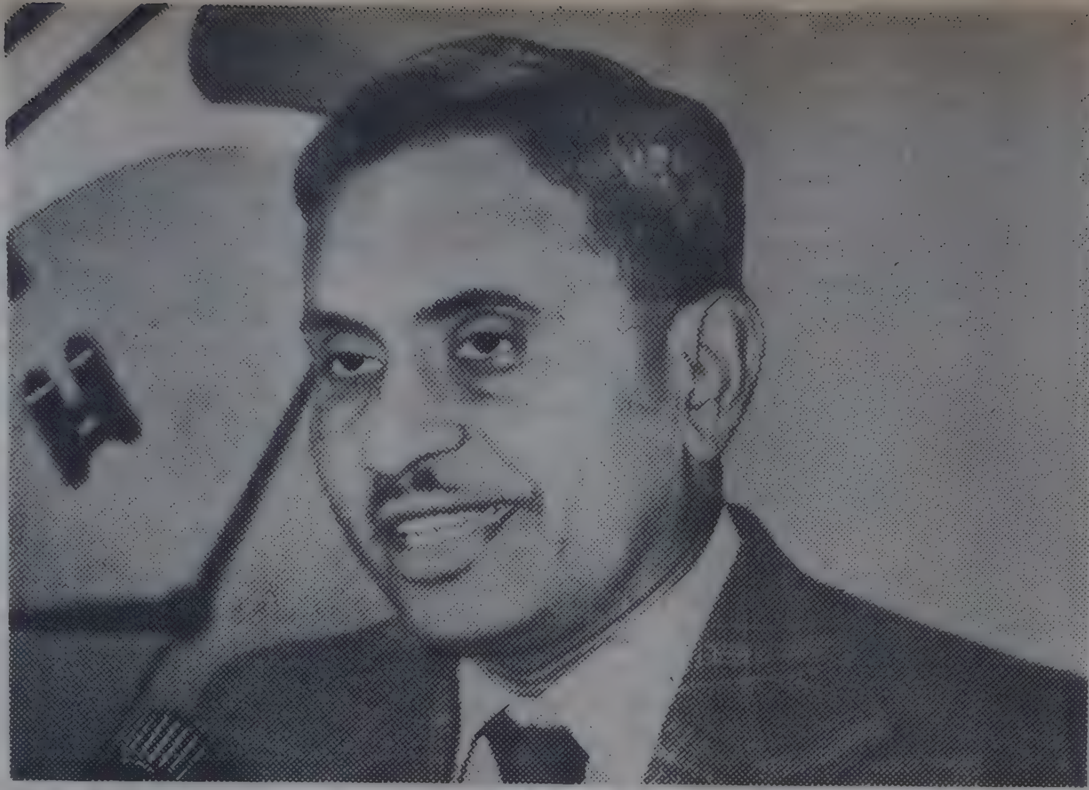
There is the other connotation of independence. A BBC interviewer once put the following question to this writer: To what extent has the civil service retained its independence? The reply given was that the independence of the civil service was a concept relevant to democratic systems in which governments came and went but the civil service was expected to serve successor governments as faithfully as it did the predecessors. That it was pointed out, was the British usage of the word 'independence'. In India, since there was no democracy during British rule, there was no question of the civil service having been independent in this sense. Therefore, the issue was not how far the civil service had *retained* its independence, since it never had any, but how far it had been able to *become* independent in the new democratic context of free India. The difficulty we had had to contend with was that Congress had remained in power at the centre almost all the time since we became a democracy and the civil service thus had not had opportunities to adjust to changes of government.

We have far to go in regard to this kind of independence. Sadly, starting with the Emergency, the trend has been in a negative direction. The distinction between the government and the ruling party is tending to get blurred, at the centre as well as in most of the states. The responsibility for this lies primarily with political leaders. But the civil service has also been lending a hand. Only the other day a noted journalist, Tavleen Singh, reported her experience at a "truly high-power dinner" organised by the joint secretary, external publicity, one Aftab Seth. It was attended by a "dazzling array of senior bureaucrats", including the cabinet secretary, the principal secretary to the prime minister, the finance secretary, the I and B Secretary and "sundry high-powered joint secretaries". One of the questions that aroused much discussion related to the advent of the political bureaucrat, that is one who openly supports the ruling party and not just the government. Somehow it seemed to the journalist that the older lot were less susceptible to this tendency.

The implication that all were susceptible, the younger lot only more so, is indeed disturbing.

There is a discernible tendency in the civil service to treat the Congress as the natural ruling party. The mischief was done during the early decades when the only rule was Congress rule. A cosy relationship came into being during this period between Congress rulers and the civil service. Congressmen came to think of civil servants as servitors of Congress power and civil servants, by and large, came to regard Congress rule as naturally ordained. Circumstances have changed since then, for there is no state where Congress has not been dislodged from power at some time or the other, and that applies to the centre too. But mindsets tend to ignore facts. Consequently Congressmen, especially those at the centre, continue to find it difficult to accept the idea of an independent civil service. Civil servants on their part find it equally difficult to graduate out of their tilt towards Congress. It has taken three elections to make the West Bengal civil service begin to accept the inevitability of non-Congress rule in that state. The leadership of the Janata in Karnataka and the Telugu Desam in Andhra Pradesh were convinced that there were elements in their respective civil services which had Congress proclivities and for that reason could not be trusted. New-to-power political parties are over-sensitive about such issues. But their suspicions about the civil service in these instances were not entirely without foundation.

With non-Congressism on the rise in the states and the possibility of a non-Congress alternative even at the centre in the air, the civil service will have to learn to be more independent in the political sense. The need for such independence will be all the more if democratic self-governance is extended to sub-state levels.



Shri P.S. Rama Mohan Rao I.P.S. *Chairman, Hyderabad Allwyn Limited*

WATCHWORDS FOR GROWTH: DIVERSIFY. INNOVATE. AND ADD VALUE.

On behalf of the Board of Directors and on my own behalf, I extend to all of you a very warm and cordial welcome to this 46th Annual General Meeting of your Company. As you may be aware, I assumed charge as the Chairman of the Company only in February this year. This is an assignment which I feel genuinely happy to fulfil with your goodwill and support.

The Directors' Report and the Audited Accounts for the seventeen month period ended 31 December, 1988, together with Auditors' Report have been with you for some time now. May I therefore, with your permission, take them as read.

Growth maintained. 15% dividend declared

Your Company kept up its momentum of growth during the year 1987-88 also. The gross revenue increased from Rs. 108.20 crores in 1986-87 to Rs. 192.48 crores in 1987-88, thereby registering an improvement of more than 25% on an annualised basis. Correspondingly, there was a jump of more than 30% in the operating results from Rs. 11.95 crores in 1986-87 to Rs. 22.09 crores in 1987-88. The net profit (after depreciation and interest) for the period under review amounted to Rs. 4.47 crores as against Rs. 3.46 crores for the year 1986-87. Keeping in view the heavy investments being made for modernisation and expansion of capacity, your Directors have, however, recommended that the dividend may be limited to 15% for the extended period of 17 months. The Company has been continuously making profits for the last one decade and paying a reasonable dividend to its shareholders. Thus, it has come a long way from 1969 when, at the time of the Government of Andhra Pradesh taking over its management, the turnover was just Rs. 5.14 crores.

The operating results in 1987-88 have to be viewed in the background of the various adverse circumstances like power cuts, foreign exchange rate fluctuations and the higher burden of depreciation and debt service on account of the new plant and machinery installed, not to speak of the sharpening competition in the market place.

Nevertheless, the performance of your Company provides encouraging proof of what Public Sector can achieve, given the right mix of Government policy, management practices and employee attitudes.

C H A I

Delivered at the 46th An
Hyderabad Allwyn Lim
at 10.00

Comprehensive modernisa programme underway

In a consumer durable industry like product quality and customer satisfaction have become crucial t gaining and sustaining the compe edge. The liberalisation of industria licensing policy in the country has transformed what was a seller's ma into a buyer's market and whetted appetite of the customer for Qualit Value and Service. **And in an era o technological change and obsolescence, constant product innovation and value addition are for survival in the market place.** No important than all these factors is t economy of scale in production in to keep the competitive edge.

All these considerations have impe your Company to embark upon a comprehensive programme of modernisation of machinery, expa of capacity and strengthening of t marketing organisation. The salien features of this effort consist of:

a) Modernisation of the existing production facilities at Hyderab a cost of Rs. 12 crores.

b) Doubling the capacity for prod of compressors at Hyderabad, c cost of Rs. 18 crores.

c) Installation of a new and mode refrigerator plant with a capaci 1.25 lakh units per annum at Nandalur in Cuddapah District fulfilment of Government's Polic encouraging dispersal of indust into backward areas. This facilit estimated to cost about Rs. 25 c

d) Provision of balancing equipme the Watch Plant at Patancheru cost of Rs. 20 crores, to attain th capacity production of 2 millior watches per annum. Besides reducing the import content of watches to the unavoidable minimum.

To finance these projects partly, yo Company has raised additional e

General Meeting of held on Friday, 30th June, 1989 at Hyderabad.

apital of over Rs. 10 crores through ghts shares of Rs. 10/- each, floated at a emium of Rs. 2/- per share. I must avail his opportunity to thank all of you for aking the issue a success.

etter service and better roducts

ll these projects which are expected to e commissioned before the end of 1989 vill no doubt improve the Company's trengths in the market place. But, it eeds to be reaffirmed here that these trengths will be of little avail unless there s a matching effort at improving customer service and in assessing and esponding to quickly changing consumer tastes and preferences. owards this end, an exercise has also een initiated at revamping and trengthening the marketing organisation besides **investing more esources of mind and money in esearch and development. Your Company's aim will be to constantly set the trend for product innovation and value addition.**

In this context, I must also affirm that the track record of your Company is something one can be legitimately proud of. **Every single innovation feature in the domestic refrigerators has been pioneered by your Company starting from the roll bond freezer and ending with colour models. On the Watch front also, your Company has lived up to its promise and reputation in this regard by introducing, for the first time in the country, Polyamide Watches which are rugged, light and relatively inexpensive.** We are heartened by the public response to this new product.

Growth through diversification

No industry can survive without orderly and rational growth. In the policy matrix of the Indian economy, diversification is by now well recognised as an **essential component of growth. With the policy of broad banding of goods for the purpose of industrial licensing, the need has arisen to become more alert and sensitive to opportunities for diversification, even if in related fields.**

Your Company, will therefore, explore all possibilities for diversifying its product mix even while making every effort to quickly bring the capacities, already added, to full utilisation on a stable basis. As it is, the Company's product portfolio is so wide ranging as to encompass refrigerators, bottle coolers, deep-freezers, air-conditioners, watches, furniture, industrial sewing machines and bus and truck bodies. On the initiative of the State Government, the Company proposes to go into the manufacture of agricultural implements, for which a subsidiary company in partnership with State Agro Industries Corporation and the AP Agricultural University is to be incorporated.

People – our invaluable asset

It is axiomatic that an organisation can only be as good as the Quality of its people. With more than 11,000 employees on its rolls, your Company could not afford to be insensitive to their needs and aspirations. The employees are equally conscious of the reality that their well being and future are organically inter-twined with the prosperity and growth of the Company. The outcome of this happy synthesis of attitudes has been the continuously cordial and warm relationship between the management and employees, right from 1969, characterised by the absence of any strikes or lockouts. The contribution of the recognised employees' union to this ideal state of affairs merits public acknowledgement.

Higher productivity through creativity

Productivity through people has become one of the commandments for industrial excellence. Your Company is fully alive to the implications of this principle in terms of adapting and updating human skills at production in step with the revolutionary changes in technology. Productivity can also be improved through unleashing the creative capabilities of human beings and providing a climate of self motivation and control. Quality Circles are by now widely recognised and accepted, all over the world, as an effective channel for the creative energies of workers. Your **Company has been actively encouraging the formation and functioning of Quality Circles whose number has now exceeded 50. It is a matter of great pride and immense satisfaction that one of the Quality Circles of your Company has been adjudged as the best at the National Convention held recently in Bangalore** under the auspices of the Confederation of Engineering Industry. Apart from Quality Circles, it is the earnest wish of the Company to encourage various other forms of skill building and productivity promotion, by making adequate investments in training and organisation development.

Savings through stricter energy audit

Conservation of energy is a national concern, given the size of India's population, its limited resources of liquid fuel, the profile of its hydel power potential and its ecological imperatives. I am glad to report that your Company, has initiated various measures to conserve energy and ensure a strict audit on the consumption patterns. As a result, the savings on energy consumption alone amounted to Rs. 30 lakhs during 1987-88, apart from the contribution to the national cause.

Future depends on what we do today

I must, however, conclude on a note of caution. The future affords no room for complacence. The challenge of competition in the market place is growing fierce and complex at the same time. We need to be both perceptive and resilient to meet the challenge. Consolidation of the existing lines of production has to be combined with quick investments in new areas of promise and profitability and an equal readiness to divest from areas which have no future and, if persisted with, will only affect the bottom line. This will be possible only if the Company continues to enjoy the confidence, support and cooperation of the Union Government, Government of Andhra Pradesh, Financial Institutions, Bankers, our Foreign Collaborators, Employees, Suppliers, Customers and all of YOU. With such cooperation and understanding from all concerned, your Company can continue to move in the front ranks of the Indian Industry.

This does not purport to be a report of the proceedings of the 46th Annual General Meeting.

Food Subsidies: In Search of Cost-Effectiveness

Ashok Gulati

ood Subsidies in Developing Countries: Costs, Benefits and Policy Options edited by Per Pinstrup-Andersen; ublished for the International Food Policy Research Institute, USA, by the Johns Hopkins University Press, Baltimore nd London, 1988; pp xvii + 374.

I
Explicit and Implicit Food Subsidies

UBSIDISING food is a widely prevalent olicy in most of the developing countries f Asia, Africa and Latin America. Its form nd dimension, however, varies across counies depending upon the mix of political, ocial and economic factors. Accordingly, enefits and costs of specific food subsidy rogrammes also differ significantly. The xperience gained from different variants of hese food subsidy programmes can be of nmense guidance to policy makers of eveloping countries in assessing and modiying their own food subsidy schemes with view to making them more cost-effective. 'iewed from this angle, the book is an imortant contribution in the field of food olicy

The book, perhaps first of its kind, is in act a confluence of eight years long 1978-86) research initiated by IFPRI on the uestion of food subsidies in developing ountries. More specifically, nine countries ave been studied in the book, although essons are also drawn from the experiences f other countries. Three papers focus on gyptian food subsidies, two on India and ne each on Philippines, Bangladesh, akistan, Sri Lanka, Brazil, Mexico and ambia. Another nine chapters synthesise he findings of these country-specific studies n different aspects of food subsidies. One nore deals with introduction and two with nacro and micro policy implications of onsumer-oriented food subsidies.

The thrust of this book is reviewed here ritically under four aspects of food subsidy. The first aspect deals with identification and uantification of food subsidies in its xplicit and implicit forms; the second and hird with the measurement of benefits and osts (respectively) of food subsidies; and the ast with various alternative options to make ood subsidy programmes more costffective. Additionally, based on the nethodology enunciated in several papers contained in the book, an attempt is made o provide certain latest estimates of food ubsidy (explicit and implicit) for India. It s expected that these estimates and the analysis based on them would lead readers owards a better understanding of the subect in Indian context.

Food subsidies to consumers in developing countries generally assume two forms: explicit and implicit. Explicit subsidies refer to those food-related consumer subsidies, which are financed by the government budget (central or state). Implicit food subsidies, on the other hand, are those that are financed by producers of food. This happens as a consequence of several economic policies towards the agricultural sector, food in particular, which make the producer's prices lower than what they would be otherwise. The distinction between explicit and implicit food subsidies assumes greater relevance once one tries to identify the group (or sector) who bears this 'burden'. In the case of explicit subsidies, the affected group will differ depending upon whether the government finances this food subsidy through deficit financing or taxing a particular group (sector), or cutting back the allocation of a specific sector. In case of implicit food subsidies, however, the entire burden is borne by the agricultural sector.

In most of the developing countries the commodities subsidised are wheat, rice and maize, and the form of subsidy is either explicit, or implicit or both simultaneously. For example, in Bangladesh wheat and rice are subsidised mainly explicitly. But Brazil subsidises wheat both explicitly and implicitly. So does China in the case of rice and Zambia in the case of maize. Wheat is explicitly subsidised in several developing countries such as Egypt, India, Morocco, Pakistan and Sudan, while rice is explicitly subsidised in Philippines, India and Sri Lanka. Thailand is a classic case of implicitly subsidising rice through an export tax. The dimension of explicit food subsidies differs across countries. For example, in Bangladesh food subsidy (including food aid) was 5.1 per cent of government budget during the triennium ending (TE) 1979-80. If food aid is excluded, this percentage would touch 9.67 for the same period (Ahmed, p 223). In Egypt, which appears to be running comparatively the biggest food subsidy scheme amongst developing countries selected in this book, food subsidy accounted for about 11.6 per cent of government budget during TE 1976, and about 9.5 per cent during TE 1980 (Von Braun, p 185, see the histogram). In Sri Lanka, the food subisidy was as high as 15 per cent of government budget in 1977, but came down significantly touching less than 5 per cent by 1982 (Edirisinghe, pp 258-59). Similarly, in Pakistan the food subsidy through federal and provincial governments was of the order of 14.6 per cent of government budget during TE 1975-76, and declined to only 6.7 per cent during TE 1982-83 (Rogers, pp 250-251). These examples clearly reveal one thing: that explicit food subsidies as a share of government budgets in most of the developing countries were quite high in the early 1970s, but declined significantly during the late 1970s and early 1980s. This happened partly as a result of falling international prices of wheat and rice, especially since 1982, and partly due to significant changes in domestic food subsidy policies in several developing countries such as Sri Lanka, Pakistan, Bangladesh, etc.

The dimension of implicit food subsidy also differs widely across countries. Several policies are adopted to bring in effect implicit food subsidies. These policies generally operate by controlling or tinkering with foreign trade. For example, by imposing an export tax on food (like on rice in Thailand) its domestic price can be made lower than its international equivalent price. Sometimes interventionist policies in the domestic market can also achieve the same end, for example, through imposing levies on producers or millers of food. Miller's levy in case of rice in several Indian states, particularly Punjab and Haryana, which contribute more than 60 per cent to the central pool, is a case in point. Domestic policy might also take the form of monopoly procurement by government, like paddy procurement in Thanjavur district of Tamil Nadu state. It may also suppress domestic producer's prices, especially in surplus areas, by imposing restrictions on the movement of foodgrains from one state or zone (surplus) to another (deficit). All these mechanisms ultimately have their common goal: that the domestic prices of food be made cheaper than what they would be otherwise. And that this goal is achieved without any significant fiscal cost to the government. Depending upon the intensity of policies adopted, results varied in different countries. For example, in Sri Lanka the domestic price of rice was 83 per cent of its equivalent international price during TE 1980. Similarly, this percentage was 78 for Bangladesh rice in 1977-78 and 65 for Thai rice during 1978-80. In case of wheat, domestic producer price in Pakistan was 88 per cent of equivalent international price

during 1976-81; 57 per cent in Egypt during 1978-80 and 100 per cent in Brazil during 1977-81 (Von Braun, p 100).

What is the Indian scene in terms of explicit and implicit food subsidies? Out of the two articles on India, the one by George attempts to provide these estimates, while the one by Binswanger and Quizon tries to quantify the effects of various policy packages on relevant variables such as national income, cereal production, cereal prices, wage rate, labour employment, etc. Binswanger and Quizon carry out this exercise by using their econometric model for Indian agricultural sector (1986) based on a reference year of 1973-74, and then conducting simulation experiments under alternative scenarios. George's estimates of explicit food subsidy for 1980s, however, do not have decomposition in terms of consumer subsidy and buffer stock subsidy. But more questionable is his stand about implicit food subsidy. While George maintains that compulsory procurement does not act as disincentive to producers (it may rather raise his price) (p 235), Binswanger and Quizon estimate that it does adversely affect the producers (p 312).

To have a clear idea of India's explicit and implicit food subsidies, we have generated our own estimates for 1980s as follows: explicit food subsidy is deemed to compose of consumer subsidy and cost of carrying buffer stocks. Consumer subsidy in turn is estimated as the difference between economic cost[1] of foodgrains to Food Corporation of India (FCI) and its wholesale issue price. This difference is reimbursed to FCI by the central government as consumer subsidy. Besides this, government maintains a buffer stock as an insurance against crop failure or even to keep prices within reasonable limits. There is a sizeable cost incurred in maintaining this buffer stock in terms of interest, godown charges, etc. This is added in consumer subsidy to obtain explicit food subsidy (see table). Estimation of implicit food subsidy involves the assumption of free trade not only within the domestic economy but also across the national boundary. The difference in the producer's price under this free trade scenario and what he is actually getting under existing controlled trade scenario is the implicit food subsidy to consumers. If India is considered as a net importer[2] of foodgrains like most of the other developing countries; then the likely price which Indian farmer would get for his grain under the free trade scenario would be the import parity price. If imported grain competes with the domestic grain in the port city, the price would be fixed there as equal to the landed cost of imported grain. For the domestic producers of grain in the surplus areas, the import parity price would get squeezed by transport and marketing costs from port city to surplus area. On the other hand for producers in deficit areas, the price would be either equal to the landed cost of imported grain in the port city *plus* transport and marketing costs from the port city to deficit area or the price in the surplus area plus transport and marketing costs from the surplus to deficit area, whichever of the two is lower. It is with this methodological framework that we have estimated the implicit food subsidy on wheat and rice. In the case of wheat, imported wheat from the US is assumed to compete and set the price in Bombay, while in the case of rice, imported Thai rice competes with domestic rice at Calcutta. Their import parity prices for domestic producers are estimated by deducting 5 per cent from their landed costs towards domestic transport and marketing costs. The price wedge between import parity price (so obtained) and the procurement price[3] is multiplied by the quantity produced at home. This renders estimates of implicit food subsidy (see the table).

The table presents estimates of both explicit and implicit food subsidies for wheat and rice during 1980s. It may be observed that explicit food subsidies are on a sharply rising trend and have more than trebled by 1986-87, implicit food subsidies have more than halved between 1980-81 and 1986-87. The per unit explicit food subsidy has gone up by more than 80 per cent over the period. Within this, however, the consumer subsidy per unit has revealed an increase of 120 per cent. Thus, total consumer subsidy increased both because of increase in the volume of food procured and distributed by FCI as well as due to faster increase in per unit economic cost over issue price. On the contrary, buffer subsidy has almost trebled primarily due to the increasing size of buffer stocks. Implicit food subsidy which was more than seventeen times the explicit subsidy during 1980-81, declined to levels that was only twice the size of explicit subsidy by 1986-87. This rapid decline in implicit food subsidy was the result of a dramatic fall in prices of rice in international market. Nevertheless, the implicit food subsidy still constitutes a major component of total food subsidy to Indian consumers. The implication of this result is quite clear: it is the cutivators of wheat and rice who are financing a larger portion of food subsidies. The budget subsidy on food as presented in government budgets is a gross underestimation of the extent of food

TABLE: EXPLICIT AND IMPLICIT FOOD SUBSIDIES IN INDIA DURING 1980s

Particulars	Unit	Years 1980-81	1981-82	1982-83	1983-84	1984-85	1985-86	1986-87
1 Explicit Food Subsidies (1A+1B)	Rs crore	661.48	777.22	944.09	1091.37	1352.68	1890.96	2132.64

4 Total food subsidy as percentage of GDP at factor cost (current prices, new series)	per cent	9.81	8.05	3.12	4.01	4.09	3.47	2.54

Notes: 1 Food subsidy here indicates subsidy on wheat and rice only.
2 Figures in parentheses are subsidies (Rs) per quintal of grain (wheat or rice or both combined).
3 Implicit subsidy on wheat is estimated by multiplying the price wedge between import parity price (April-June) and procurement price by the quantity produced. Similarly implicit subsidy on rice is estimated by multiplying the price difference between its import parity price (October-January) and Punjab procurement price of rice (which on an average is higher than for other states) by the quantity of rice produced.

subsidy. The transfer of resources from government to private sector (consumers), therefore, is minor. The major transfer of resources takes place within the private sector, that is, from the producers of food to consumers of food. Viewed from another angle, this implicit subsidy on food is in fact an 'implicit tax'[4] on cultivators of wheat and rice.

II

Benefits from Food Subsidies

One may measure benefits from food subsidies in terms of the objectives that this subsidy policy had set out in the relevant country. Reviewing the cross-country food subsidy policies, Valdes in his probing article spells out five possible objectives of food subsidies: "(1) reducing malnutrition among low income groups; (2) achieving food security (i e , reducing instability in food consumption, particularly for some targeted segment of the population); (3) redistributing income in urban areas; (4) lowering food prices, thus enabling wages to be low relative to the price of industrial goods as well as relieving the fiscal burden of public sector employment; and (5) reducing domestic price inflation" (Valdes, p 78).

Given high income and price elasticities for staple food, particularly among the poorer households, food subsidies in all probability are likely to result in higher food consumption by the poor. This would have a positive effect on the nutritional status of the hitherto malnourished amongst the poor. This is clearly borne out by the country studies. For example George's paper on India presents estimates of calorie reduction if rationing (food subsidy scheme) were discontinued in Kerala and Gujarat states. Based on his earlier (1983) work, George calculates that in Kerala calorie intake would go down by 46 per person amongst the higher income group and by 138 amongst the lowest income group. The highest loss of 224 calories per person, however, is to the households of low middle income group (Rs 1,201-2,400 annual household income). In Gujarat, loss would be in the order of 178 calories per person in the highest income group and 192 calories per person in the lowest income group (George, p 239). In Sri Lanka the food subsidy scheme contributed 151 calories per person in the lowest expenditure quintile, which constituted 11 per cent of the total calorie intake by that expenditure group. This contribution was just 0.6 per cent in the highest expenditure quintile (Edirisinghe, p 264). In Pakistan, the income effect of food subsidy scheme is estimated to be about 114 calories per person in urban households below median income levels and 37 calories to households above these levels. The increase in rural calorie consumption was negligible (Rogers, p 247). In Bangladesh the low income urban consumers are estimated to have consumed 250 calories more per person due to subsidised rationing system (Ahmed 1979; Pinstrup-Andersen, p 11). In Philippines, the results of a pilot study of food discount programme revealed that it contributed about 140 calories per adult equivalent per day, which is approximately 8 per cent of the total calories consumed by those households. While these studies amply demonstrate that food subsidy schemes help raise the consumption levels and thereby the nutritional status of the poor and the middle income groups, there is hardly any evidence about the effect of food subsidies on intra-household food distribution and thereby its impact on the nutritional status of the individuals, particularly women, within the beneficiary household.

The objective of food security has two aspects—one relating to household food security and the second to national food security. While the two are interwoven to an extent that it would be difficult for a country to ensure food security at household level without first ensuring it at national level, yet the distinction between the two is desirable because of their separate effects on food subsidy scheme. The ration or fair price shops in India, Pakistan, Bangladesh, etc, assure a fixed quantity of foodgrains to households at a fixed price. This provides an effective insurance cover to households buying from these ration shops against the fluctuating market prices. In consequence, price and accompanying consumption fluctuations are transferred either to government or to the rest of the market (Pinstrup-Andersen, p 4). The operation of such a food system involves explicit costs (subsidies) which are revealed in the estimates of consumer subsidy. For India, as seen from the table, this estimate varied from Rs 485 crore in 1980-81 to Rs 1,622 crore in 1986-87. In case of national food security it is the subsidy (cost) of carrying a required amount of food as buffer stock which is relevant. In the Indian case this was Rs 176 crore in 1980-81 and Rs 510 crore in 1986-87 (see table). The success of food subsidy policy with respect to food security objective would depend upon the extent to which household consumption depends upon these ration shop supplies and what is the relative size of buffer stocks. Estimates differ across countries.

Redistributing income through food subsidy is another objective which may be examined with care. In many developing countries, distribution of subsidised food has a clear bias in favour of urban people, which are relatively better organised and more vocal. Often the most potent groups are civil servants, the military, urban labour and sometimes industrial interests (Hopkins, p 124). Given this political calculus, the major share of food subsidy gets concentrated in few pockets. In India, Maharashtra, West Bengal, Tamil Nadu, and Kerala account for about half of food distributed through FPS. Within these states, Bombay, Calcutta, Madras and Delhi cities account for the larger share. It is only in Kerala and Jammu and Kashmir that subsidised food system is extended properly to the rural areas. But in other states, although fair price shops exist in rural areas, supplies remain concentrated in urban areas. On the whole, urban areas are estimated to be receiving about 85 per cent of the total foodgrains distributed by the government of India (George, p 236). Across various income groups in India, George presents an approximate figure of 65 per cent subsidised grain going to households with annual incomes of less than Rs 3,600, 20 per cent to those in the Rs 3,600-4,800 range, and 15 per cent to those with incomes of more than Rs 4,800 (p 237). Similarly, a strong urban bias was found in food subsidies in Bangladesh (Ahmed, p 228); Pakistan (Rogers, p 248) and China (Lardy, 1983; Pinstrup-Andersen and Alderman, p 26). However, the subsidised food system in Sri Lanka, Egypt and Kerala in India was not found to be having that type of urban bias (Pinstrup-Andersen and Alderman, p 26).

The lowered food prices in the urban areas through concentration of subsidised food in these pockets, obviously must have helped to keep wages of workers relatively low. Although there is not much empirical evidence on this in the papers contained in the book, it won't be illogical to say that it helped the employers in the organised sector—the government and the private capitalists—to keep their wage bills low. It appears that the employer in the private sector is in fact a gainer from this system, more so when supplies of subsidised food are concentrated in urban cities. If these capitalists operate in an oligopolistic market environment for their produce, as is the case in most of the developing countries, this helps them in raising their profits.

Subsidised food systems also act as an anchor to domestic inflation and thereby help the country to avoid social unrest. Scobie, in his study on Egypt, comments that subsidised prices were seen as part of the moral responsibility of the rulers and was an important element in the preservation of social stability. And this has happened there for centuries. Any violent instability in food prices leads to food riots, which were as real in the fourteenth and fifteenth centuries as they were in 1975 and in January 1977 (Scobie, p 197).

Besides the various benefits spelt out above, one should also attempt to quantify the impact of food subsidy on human capital formation and thereby net return on it in terms of increased labour productivity. Although, the papers contained in the book do not focus on this issue, Valdes draws some evidence from Torche's work (1981) on Chile's national health and nutritional programme for pregnant women and pre-school children. Valdes concludes that the long-term social rate of return on this programme was substantially higher than 17 per cent. "Hence such investment in supplementary feeding and health for the poor not only helped in providing a basic need—improved health and nutrition for pre-school children and mothers—but it also contributed to increasing the long-term productive capacity of the poor" (Valdes, p 91).

III
Costs of Food Subsidies

Technically, costs in economic jargon are defined as the benefits forgone. Therefore, to measure economic costs of food subsidies, one must identify the group which loses and quantify that loss in terms of benefits forgone. A proper identification and quantification of these losses can be carried out in a macro-economic framework that encompasses not only fiscal and monetary policies but also policies pertaining to foreign trade and exchange rate.

As far as *explicit* food subsidy is concerned, which is financed from the government budget, its cost can be measured by examining how the government recovers this financial expenditure on food subsidies. Does it go for additional taxation on a particular group? If so, the cost of food subsidy would be the benefits forgone by that group whose income is taxed by the government. If, on the other hand, food subsidy is financed by deficit financing, which might generate inflationary pressures in the economy, the cost would be measured by the benefits forgone by various groups in the economy as a result of inflation. If, however, the food subsidy is financed by cutting down expenditure on some other head in the budget, the relevant cost would be the benefits forgone in that particular sector. Since governments never specify how they are financing expenditures under a particular head, such as food subsidies, it becomes very difficult to capture the true economic cost of these food subsidies. What an economic analyst perhaps can do is to create alternative scenarios by conducting several policy simulations in a macro-economic model of the country under consideration. This is essential because food subsidy policy is not an isolated policy. It has macro-economic linkages, which must be identified and quantified for any meaningful estimates of costs. This is all the more important for those countries which incur heavy expenditure on food subsidies.

Scobie's paper (pp 49-76) presents a theoretical framework, which would be a very useful piece of analytical approach for the economic analysts of food subsidy policies in several developing countries. Binswanger and Quizon's paper on India is equally important as it gives an empirical mapping to the technique of capturing effects of several policy packages pertaining to food subsidies in a comprehensive general equilibrium model of India's agricultural sector. More research is required to appropriately quantify the economic costs of food subsidy policies than what is contained in this book. Most of the country papers in the book have confined their analysis only to the measurement of direct financial cost of running a food subsidy programme. Estimates differ across countries. For example, Egyptian food subsidies accounted for 20 per cent of current expenditures and 7 per cent of GDP in 1980-81. Sri Lankan subsidies reached 14 per cent of government expenditure and 6 per cent of GNP by late 1970s. In the late 1970s, the direct costs of Chinese food subsidies have been reported as 23 to 26 per cent of government revenue. In Bangladesh, food subsidies represented between 15 and 27 per cent of current government expenditure in the mid-1970s (Scobie, pp 60-61). In India, the revised budget estimate of 1987-88 puts the food subsidy at about 4 per cent of central government budget expenditure. George's paper on India goes a little further and estimtes the indirect subsidy which FCI receives in the form of subsidised interest rate. This interest subsidy, George estimates at Rs 94 crore for the year 1980-81 (George, p 235).

What is the economic cost of *implicit* food subsidy? We know that implicit food subsidy is financed by the producers in the agricultural sector rather than through the government budget. Therefore, true economic cost of the implicit food subsidy should include not only the loss in income that cultivators suffer but also capture the impact of these depressed incentives for producers on the agricultural output and other relevant variables in the economy. We have estimated in the table, the size of this implicit food subsidy, which happens to be much larger than the explicit food subsidy. In order to quantify its effect on the agricultural sector only, a partial analysis approach would be to look at the supply response functions of these commodities, or preferably at the aggregate supply response functions. In this regard it may be noted that an analysis of 34 developing countries by Agarwala (1983) revealed that in countries with higher degree of price distortions indicating implicit subsidy to consumers (and implicit tax on producers), the growth rate of output was 28 per cent and that of exports was 43 per cent below the rates in countries classified as having low distortions (Scobie, pp 58-59). It would have been interesting if the papers in the book had analysed how these disincentives affected capital formation in the agricultural sectors of various developing countries pursuing implicit food subsidy policies. One paper on Egypt (Von Braun, pp 183-195), however, reveals that increasing food subsidy (particularly implicit) raises the demand for input subsidies by cultivators. Therefore, to have an idea of the 'net effect' on farmers' incomes, one should adjust input subsidies in the implicit tax (subsidy). But none of the papers in the book has attempted to estimate this 'net implicit tax' on cultivators as a result of implicit subsidy to consumers.

IV
Towards a Cost-Effective Approach

While we have seen above that benefits from the food subsidy scheme are in terms of increased consumption or enhancement of income amongst various expenditure groups, measurement of economic costs is rendered difficult due to lack of precise knowledge about the actual source of financing explicit subsidies. Thus, most of the studies have not gone beyond the quantification of explicit budget subsidies. Although it was desirable that corresponding estimates of implicit food subsidies at least would have been worked out for each country studied, yet only a few have attempted to explore this aspect in detail. Nevertheless, it appears that these studies arrive at one common point of agreement: that the benefit-cost ratio, howsoever measured, can be improved if an appropriate form of 'targeting' is incorporated in the food subsidy scheme. The exact nature of targeting would vary across countries depending upon the socio-economic conditions and the degree of political power that different groups enjoy in that country. At present, we observe a strong bias in favour of urban people in the food subsidy schemes of various countries (see Valdes, p 84). This happens, presumably due to two reasons: one, given a high density of population in urban areas, financial cost of distributing food subsidy becomes smaller. And two, urban people are often more organised, vocal, and exert political influence. While this urban bias results in lowering financial cost of distributing food subsidy, it also lowers the benefits derived from this scheme because beneficiaries are not the ones most deserving either on norms of income or nutrition. Depending upon size of this 'leakage' in food subsidy, i e, what goes to undeserving beneficiaries, total cost of food subsidy may be too high to sustain for long. This would lower the benefit-cost ratio even more. Thus, designing an efficient system of 'targeting' and reaching that target group become an integral part of food subsidy schemes.

The targeting may be income-based as is the case in US food stamp programme. In such a system of targeting, procurement and distribution of food remains with the private sector. The government is concerned only with the printing and distribution of food coupons, and then giving some commission to retailers who supply food to consumers against those coupons. In this process, not only the administrative cost of running the food subsidy scheme is minimised but also the 'leakage' of subsidy going to ineligible beneficiaries is reduced. Thus, the benefit-cost ratio is likely to be quite high. However, this income criterion for targeting runs into several problems in developing countries where the unorganised sector without any proper income records dominates. The extent of 'leakage', therefore, is likely to be much greater, lowering the benefit-cost ratio substantially. Besides, successful working of a food stamps programme also requires a well developed and widely spread out banking and bureaucratic network to identify the eligibie beneficiaries, distribute food stamps to them and then also undertake redemption of stamps. This type of facility is often lacking in developing countries and hence the income criterion will not be a suitable choice for them to reach the target groups.

Geographic targeting was followed in Philippine food price discount programme (Garcia, pp 206-218). Areas are selected for food subsidy programmes on the basis of nutritional deficiency. There is already an agency (National Nutrition Council), which keeps a track of nutritionally worse-off villages through Operation Timbang. Depending on its results, villages are selected for food subsidy and all households in that target village are extended that facility (Garcia, p 209). Obviously, such a scheme would be cost-effective only if the target population is densely inhabited in certain villages, and these villages are somewhat isolated from those with untargeted population so that the possibility of leakage is minimised. But in countries where the target population is interspersed with the untargeted one, it becomes difficult to operate such a scheme.

There have been experiments in different countries to feed only pre-school or school going children, or pregnant women, through subsidised food. But the administrative cost of such schemes is generally very high, and the scale of operation quite small.

The other form of targeting is through commodity and its quality. One may choose an inferior commodity with negative income elasticity for the food subsidy programme. This would imply 'self-targeting' because only those with low incomes are likely to buy that commodity, and as their incomes rise they would automatically move on to the non-subsidised food.* Theoretically, it appears very attractive, but operationally it becomes difficult to identify a commodity whose consumption is restricted only to poor people. Staple grains like wheat and rice are being consumed both by poor and rich. Thus, implementation of a food subsidy scheme that involves targeting by commodity might involve a very high degree of leakage, thereby lowering the overall benefit-cost ratio. Another variant of this 'self-targeting' approach is choosing inferior quality. It is believed that wheat might be consumed both by poor and rich, but if subsidised wheat is of poor quality, rich will not opt for it and consequently the objective of targeting will be achieved. Often it is observed that this type of approach brings more complaints to government adversely affecting its political image. This happens particularly when the subsidised quality of food is not only of lower grade but contains foreign matter.

Besides the problems listed above in targeting, a decision also has to be taken whether the supply of subsidised food to consumer will be unlimited or rationed. The benefit-cost ratio of a food subsidy programme, therefore, depends upon all these factors, and how effectively one can sort out the problems related to its design and implementation (Rogers, pp 127- 146).

How can one make India's food subsidy programme more cost-effective? The papers on India contained in the book do not address this question directly. But the wide coverage accorded to this subject in the book with cross-country experiences induces the reader to probe deeper in this direction.

Two aspects of food subsidy policy need to be explored. One relating to targeting in the distribution of food subsidy and the other pertaining to costs of procurement and problems associated with it. It is well known that on the whole, the Indian food subsidy programme which runs primarily through the public distribution system (PDS), does not have any explicit targeting. It is also known that despite opening of fair price shops in rural areas, the offtake from PDS remains concentrated in urban areas. Further, as per the existing scheme, almost everyone in urban areas has a ration card irrespective of his income (it is like an identity card which is required for several other purposes as a proof of your staying in that area). Often rich people do not avail of subsidised food due to either its poor quality or the inconvenience of queueing and waiting, and also due to prestige factor. But their quota is generally procured from government by traders running FPS. It is then diverted to the open market after cleaning, where it fetches a higher price. So two things are happening on the distribution front: first, as a result of the urban bias in PDS, food subsidy does not reach the most deserving (poor) ones, who are largely in rural areas; and second, within urban areas there is a sizeable leakage through traders who divert the 'unclaimed' quota of subsidised food to open market. To reduce this leakage and make the food subsidy programme more cost-effective, to start with at least in the metropolitan cities of Delhi, Bombay, Calcutta and Madras, targeting based on income criterion may be introduced. Since several people in these cities work in the organised sector, their income records would be relatively better than those in the unorganised sector. If the cut-off point is kept at a reasonably high level of income the political opposition to this change in policy may not be there, because that income group may not be drawing ration supplies any way. It will in fact plug the leakage that was arising out of traders' procuring these supplies and diverting them to the open market. Depending upon the experience gained in these metropolitan cities, similar steps can be taken to cover up other major industrial towns in the country.

For rural areas, targeting may be done either on commodity (and quality) basis or some sort of 'seasonal targeting' may be introduced to help the poor through food subsidy programme. Commodity targeting may differ across regions depending upon consumption habits of its inhabitants and comparative efficiency (especially with respect to water) in their production in those regions. For example, rural areas in the states of Rajasthan, Punjab, Haryana, Himachal Pradesh, Uttar Pradesh and north Bihar may be offered food subsidy through wheat and maize; in Gujarat, Maharashtra, western Madhya Pradesh and non-coastal areas of Karnataka and Andhra Pradesh through wheat, jowar and bajra; and in rest of states through rice and any other cereal t government has in surplus. The logic beh this region-specific commodity targeting not only in minimising the cost of dis buting surplus grains, but also in promot efficiency in the production of these cere To clarify this point, it may be briefly m tioned here that at present, most of the p curement of wheat and rice for the cent pool comes from the states of Punj Haryana and western Uttar Pradesh, wh is transported to far-off places in south and eastern India. The average lead distan covered by rails was 1,509 kms per consig ment in 1986-87 and 1,533 kms in 1985-8 Government market support for th cereals in these states is so strong that a no rice eating state like Punjab has gone in f rice cultivation in a big way, substituting f crops like maize and sugarcane. The proble arises because rice is a water-intensive cr while Punjab is a low rainfall area (norm rainfall about 60 cms), calling for irrigati requirement of about 164 cms. Irrigati charges, on the other hand, are pitiably lo on both canal water and on electricity in ca of tubewell water. (Revenue tariff was abo 10 paise/KWH in 1986-87 against cost operation of about 71 paise/KWH.) Beside the water-table in Punjab is receding in th rice-growing regions. Effectively, what th indicates is that the real resource cost of pr ducing rice in this region is very high, an if one adds to this the cost of transportin it down south or to the eastern region (whic incidentally is also subsidised), actual co would be even higher. Thus, production o rice in this region needs to be discourage by restructuring incentives in favour o maize cultivation. Similarly, incentives fo jowar and bajra cultivation in central western states need to be raised such tha their surplus can be generated while pro moting allocative efficiency in the croppin patterns of these regions. Such a restructur ing might involve either regionally differen tial pricing of output or uniform allocation of input subsidies per unit of output.

Turning to per unit procurement costs, on observes a rising trend despite increasing scale of procurement. With the surplus con centrated in a few states, one would expec economies of scale, but what is being observed is perhaps indicative of dis economies of scale. The reasons underlying this phenomenon appear to be (i) heavy ar rivals of grains in the market immediately after harvest almost choking the markets and transportation facilities, resulting into not only damage of grain but also heavy transit and storage losses (thefts), which were as high as Rs 151 crore in 1986-87 and Rs 136 crore in 1985-86; and (ii) lack of bulk handling facilities and procurement centres being away from railway stations. This involves lot of unnecessary local transportation and handling expenses to move the grains from markets to godowns and then from godowns to railway stations for taking the surplus grains to deficit states. While opening up of

curement centres at railway stations to ctly take the grain out of the state and oduction of bulk handling facilities will ice the per unit cost of procurement, the t of transporting to far-off places erage lead being more than 1,500 kms) not be affected. The real cost of this nsportation will be much higher if one usts for subsidy in railway freight for dgrains and the fact that half of wagons e to come back to Punjab almost empty.

The upshot of the above analysis is that introducing region-specific commodity geting in favour of coarse cereals in food sidy scheme, it is not only that distribun and procurement costs are likely to be , but allocative efficiency in cropping patns will also be enhanced.

Seasonal targeting normally is carried out ough food for work programmes. In Indian case, food subsidy distributed ough National Rural Employment Proamme (NREP), Rural Landless Employent Guarantee Programme (RLEGP), and ought relief programmes perhaps would l in the category of seasonal targeting. though this form of targeting proves very ective in reaching the target group, its ale of operation needs to be significantly panded if any worthwhile results are to be tained. It won't be out of place here to ink in terms of creating an army of conuction workers, who are organised in ngs of 25 or so each, extended three onths training on army lines and then put work such as developing a drainage stem in the waterlogged areas of the east, major and medium irrigation projects, c. Two persons in this gang of 25 workers ay look after the the kitchen work for the st, and kitchen moves along with the gang d receives subsidised rations from the heme authority. It would be desirable to ake partial cash payments on work basis, d the scheme is made a regular feature ther than a seasonal programme. Obviously would demand not only much larger sources than are being allocated at present, it also preparing productive work schemes, rganising, recruiting, training and deployg the workforce. Keeping this in mind, it pears a separate department or even inistry can be created for this, which will tegrate multiple objectives of providing roductive employment in rural areas, reducg poverty and malnutrition, and also istributing food subsidies to the target roups.

At the end, a few shortcomings of the ook may be pointed out. First, the book uffers from quite a bit of repetition of the ame arguments. This makes the book not nly voluminous but also goes against its eadability. This is particularly true of the ynthesis papers (pp 21-167). Presumably, his happens as all these papers try to draw heir inferences from the same set of coury studies. Still the overall readability of he book could have been improved with horough sifting and editing of these articles. econd, the book should have contained a methodological chapter spelling out details regarding quantification of benefits and costs of food subsidy schemes. This chapter, which could have been a synthesis of the papers by Scobie, Valdes and Braun (chapters 4-6), should provide due coverage to data problems and suggest means to skirt them. All country studies (pp 171-319) in their empirical work should have adhered to the approach delineated in this methodological chapter. Third, absence of such an approach paper in fact results in lack of symmetry in the empirical findings across countries. For example, consider measuring even the very dimension of food subsidy schemes in different countries. Some papers measure only explicit subsidies, others attempt to capture implicit subsidies too. Some express these subsidies in absolute size, others as percentage of government budgets and still others as percentage of GNP. The reader gets confused. Confusion increases as one finds different country figures for explicit subsidies in different tables (e g, in Tables 5.1 and 6.2). In the Indian case, e g, consider Table 1.1 (pp 6-7) in Pinstrup-Andersen's article which indicates that subsidy is mainly explicit and targeting is for the total population. Valdes, however, in Table 5.1 (p 84) states that explicit subsidy reaches mainly the urban population and that it is about 4 per cent of government expenditure. But Braun in his similar comparative country Table 6.2 (p 96) skips India altogether. It would have been much better if at least four tables, 1.1, 5.1, 6.2 and 6.4, in the book would have been combined into one and presented in the first introductory chapter.

Despite these shortcomings the book is a refreshing contribution to studies on food policy.

Notes

1 Economic cost comprises of procurement price plus procurement incidentals ranging from mandi charges to gunny bags plus distribution incidentals. If there are any storage or transit losses, they also will have to be taken care of.

2 In case India is considered as a net exporter, the calculation would differ because then domestic grain would compete with foreign grain on some foreign land and set the price there. For domestic producers, export parity price would be the price set on foreign land *minus* all the transport (international and domestic) and marketing expenses all the way from that foreign land to domestic producer's area.

3 We have deliberately avoided farm harvest prices as they do not take care of the quality aspect. The relevant months for wheat are April to June and for rice from October to January, when bulk of the produce is marketed.

4 It may, however, be remarked that this 'implicit tax' is gross. In order to have an estimate of net implicit tax, one has to adjust input subsidies that cultivators of food enjoy. This would amount to estimation of what in literature is known as producer's subsidy equivalent, which is not attempted here.

Neglected Aspects of India's Development Planning

Pradhan H Prasad

Indian development planning failed to examine the alternative theoretical possibilities of different values of the increment of output to investment in different sectors of the economy and to provide empirical content to these. This would have narrowed the conflict among the objectives of higher levels of accumulation, technology, employment and production in the short period.

INDIA's post-independence process of development planning is unmistakably linked with the socio-economic dynamics and the movements that took place during the colonial period. It has been maintained that the nineteenth century is an important landmark in Indian history. This period is important because the "establishment of British rule was completed in 1818, and the year 1905 marks the beginning of national struggle by Indians against the British rule".[1] The objective condition for India's independence movement was presented by the continuation of an increasing mass impoverishment and unemployment in almost every part of British India. This, in turn, was caused by a stagnant agriculture, associated with semi-feudal relations of production, destruction of Indian handicraft over time and space and also by the uneven regional but weak and partly dependent industrial capitalist development. This independence movement, initiated by the middle class intellectuals, got unprecedented mass support. However, in the later years, just a few years before independence, it also came to be largely controlled by the big industrial bourgeoisie. The process of deindustrialisation, backed by a growing unemployment had generated an intellectual climate where economic development was thought to be synonymous with 'industrial development'. This thinking can be traced in the writings of nationalist economists. Mahadev Gobind Ranade had written "while the improvement of agriculture and the development of industry should go hand in hand, in the Indian condition the latter should be given priority".[2] There is enough support for this thinking in historical writings related to that age. "The transformation of a civilisation into a nation-state was the first and foremost objective of the liberation struggle within India in the last quarter of the 19th century. The leaven which sought to bring about this transformation was the leaven of nationalism. Yet the objectives of nationalism were by no means confined to the political domain. An equally important objective was the transformation of India's traditional economy into a modern economy, resting upon industrialisation and upon the commercialisation of rural society. Behind this objective—which, of course, was not without its critics—lay the belief that an industrial revolution would stimulate the generation of material wealth and thereby provide the basis for a richer cultural and intellectual life."[3] Even Nehru with a scientific bent of mind could not escape this influence which is evident from his support to primacy of industrialisation in the context of development of India. "I am for all tractors and big machinery, and I am convinced that the rapid industrialisation of India is essential to reduce the pressure on land, to combat poverty and to raise standards of living, for defence and a variety of other purposes."[4] Such a thinking process implicitly assumed that agricultural development had limited scope, since land was limited and was subject to diminishing returns. Therefore, the labour absorptive capacity of agriculture was also thought to be negligible. The result was that questions related to agricultural development, the labour absorptive capacity of agriculture and agricultural technological revolution as a pre-condition to healthy industrial growth (in a labour surplus economy such as India) were not professionally and competently examined when our planning process was initiated.

Since, industry was more capital-intensive than agriculture in the then existing Indian situation, the thinking which dominated the planning process was of a conflict among the objectives of higher levels of accumulation, technology, employment and production in the short period. This thinking also drew inspiration from the historical evidences of the growth experience of the developed capitalist nations of the period when industrial sector had come to play a pivotal role in their progress. This assumption was further reinforced when India opted for a self-reliant growth strategy in the mid-fifties[5] because capital-goods sector was more capital-intensive than the industrial consumer-goods sector.

Fel'dman-Mahalanobis model[6] rightly theorised that in a closed economy higher is the proportion of investment flowing in the capital goods, higher will be the income generated in the long period and lower in the short period. The model also brought forth sharply the fact that marginal rate of saving (= investment) in the economy is an increasing function of the proportion of investment flowing to the capital-goods sector.[7] However, Mahalanobis failed to take into account explicitly the fact that wage-goods component of the consumer-goods sector is as much a basic good[8] as the capital goods. Therefore, our planners failed to examine the alternative theoretical possibilities of different values of ratios of increment of output to investment in different sectors of the economy and provide empirical content to these—the alternative which would have narrowed the conflict between the above mentioned objectives.

A Theoretical Formulation

Let us begin our theoretical formulation by dividing the economy into three sectors: wage-goods sector, capital-goods sector I and capital-goods sector II as follows:

$$(a_1w + a_2p + a_3q)(1 + r) = A \quad \ldots(1)$$

$$(b_1w + b_2p + b_3q)(1 + r) = Bp \quad \ldots(2)$$

$$(k_1w + k_2p + k_3q)(1 + r) = Kq \quad \ldots(3)$$

where A, B and K are respective outputs of wage-goods sector and capital-goods sector I and II, p and q are respective prices of outputs of capital-goods sector I and II and r is rate of surplus (i e, rate of profit). Here a's, b's and k's are all positive and, therefore, all the three composite commodities of the three sectors are basic goods.

Let us for the sake of simplicity take a numerical example and assume $w = 1$ and $a_1 = b_1 = k_1 = 1$ as follows:

$$(1 + 0.4p + 0.6q)(1 + r) = 6 \quad \ldots(4)$$

$$(1 + 2.0p + 2.0q)(1 + r) = 12p \quad \ldots(5)$$

$$(1 + 6.0p + 7.5q)(1 + r) = 15q \quad \ldots(6)$$

Solving the equations (4), (5) and (6) $r = 0.5$, $p = 1.5$ and $q = 4$ are obtained.[9] Assuming all wages are consumed and all surpluses are invested, the growth rate of output in the economy per unit of time is given by r (= 0.5). The proportion of investments flowing to wage-goods sector and capital-goods sector I and II are respectively x, y and v where

$$x + y + v = 1 \quad \ldots(7)$$

The conditions for allocative efficiency (without excess capacity or shortage) of resources in the three sectors of the economy are the following:

$6x/(x + y + v) = 1.5$ ...(8)

$12y/(0.4x + 2y + 6v) = 1.5$ ...(9)

$15v/(0.6x + 2y + 7.5v) = 1.5$ ...(10)

Solving for the values, we get $x = 0.25$, $y = 0.38$ and $v = 0.37$. This implies that in Mahalanobis' terminology the percentage of investment flowing in the capital-goods sector is 75 where the output-capital ratio in that sector is 0.56. The output-capital ratio in the economy happens to be 0.577 and the ratio of investment to net income (which is same as ratio of saving to net income = s) is 0.8658. The labour-capital ratio will be 0.05 in this case. It seems that given the wage rate (which here also implies given the saving rate), planning option in this case is limited to allocation of resources. This allocation, in theory, is done by the market forces in a capitalist economy. It is needless to emphasise that a's, b's and k's in the equations (1) to (3) may have more than one value representing different technologies for the production of particular commodities.[10] However, given the wage rate ($w = 1$ in this case), the technologies in each line of production are relevant which are consistent with the maximum value of r.

TABLE 1

Item (1)	Choice 1 (2)	Choice 2 (3)
1 Output-capital ratio	0.5824	0.7257
2 Percentage of saving to net income	34.34	27.57
3 Percentage rate of growth of output per unit of time	20.00	20.00
4 Percentage share of luxury goods in total consumption	82.76	59.93
5 Percentage share of wage-goods in total value of inputs	5.21	14.93
6 Percentage share of capital-goods of sector I in total capital goods	23.08	26.56
7 Output-labour ratio*	10.60	4.13

Note: * This ratio is measured in terms of wage-goods. The lower value of labour productivity in choice 2 than choice 1 is due to the fact that output-mix in the economy moved in favour of labour-intensive good and the prices (measured in terms of wage-goods) of all goods other than the wage-goods have fallen.

Let us now introduce in the economy another consumption-goods sector which has the following cost-price equation:

$(m_1w + m_2p + m_3q + m_4n)(1 + r) = Mn$ ...(11)

where M is its output, n is the price of the output and all m's have positive values (such that $m_4 \geqslant 0$).

It will be seen that r is determined by the three equations (1) to (3) consequent upon the values of a's, b's and k's. However, changes in the values of m's only change the value of n. It is, therefore, termed as non-basic-goods sector or luxury-goods sector. Let us take a numerical example which is given below:

$(1 + 2p + 3q)(1 + r) = 12n$ ...(12)

Solving the equations (4), (5), (6) and (12), we get $r = 0.5$, $p = 1.5$, $q = 4$ and $n = 2$. The conditions for the allocative efficiency of resources is now given by the following four equations:

$x + y + v + z = 1$ ...(13)

$6x/(x + y + v + z) = (1 + g)$ ...(14)

$12y/(0.4x + 2y + 6v + 2z) = (1+g)$ ...(15)

$15v/(0.6x + 2y + 7.5v + 3z) = (1+g)$ ...(16)

where g is the rate of growth of production per unit of time. There are 5 unknowns and 4 equations. Therefore, determining the values of any one of the unknowns gives us the value of other four. For example, if a policy decision is taken that production in the economy should grow, say, at 20 per cent per unit of time (i e, $g = 0.2$), the flow of resources to different sectors, the output-capital ratio, the saving-income ratio, etc, get determined (column 2, Table 2).

The other important aspect in the context of investment planning is related to the choice of technology (i e, choice of technique) of production in different sectors of production. To illustrate this, let us take an example of another technology for the wage-goods sector as follows:

$(3 + 1.03715p + 0.025q)(1 + r) = 6$ ...(17)

Solving for values using equations (17), (5), (6) and (12), we get $r = 0.4680$, $p = 0.9868$, $q = 2.5464$ and $m = 1.2983$. We term this as choice 2 as against choice 1 which is represented by equations (4), (5), (6) and (12). It will be seen that even though choice 2 shows lower rate of profit and lower rate of saving than choice 1, it represents a higher capital-output ratio and is more labour absorptive for the same rate of growth of production (column 3, Table 1). While in a non-planned capitalist economy choice 1 will prevail, choice 2 is the clear option in the context of investment planning in a labour surplus economy. There may not be much scope in terms of reduction of wages in the Indian context because of 'wage-efficiency' constraint,[11] but there is a clear choice in favour of labour-intensive technique in the context of investment planning in case of labour surplus economies such as India.

Let us now add the wage-goods subsistence sector in the model which is defined by equation (18).

$1000 + 0.00001p + 0.000001q = 1000$ ...(18)

The actual labour-output ratio, however, may be less than one in the subsistence wage-goods sector because of the possibility that workers engaged in that sector may be earning less than the wage rate.

Let us take, for example, that initially the output of subsistence wage-goods sector remains twice as large as the organised wage-goods sector under choice 1 of investment planning.[12] Then, by adopting choice 2 as the strategy, the share of subsistence sector gets reduced from about 66.67 to 36.91 per cent initially (a decline of about 44.64 per cent) in our numerical example. In case the labour supply increases by 10 per cent per unit of time and the organised sector grows by 20 per cent per unit of time as per the conditions specified in Table 1, the rate of reduction in the size of the subsistence sector will be higher in case choice 2 is adopted as the strategy of investment planning rather than choice 1 even though choice 1 offers higher rate of profit than choice 2 (Table 2).

TABLE 2

Item (1)	Choice 1 (2)	Choice 2 (3)	Choice 3 (4)	Choice 4 (5)
1 Rate of profit in the organised sector	0.50	0.468	0.468	0.468
2 Percentage rate of saving with respect to non-wage income	40.00	42.74	42.74	40.00
3 Percentage rate of growth of output in the organised sector per unit of time	20.00	20.00	20.00	18.72
4 Percentage rate of growth of output in the economy (organised plus subsistence sector)	17.23*	16.07	16.96	16.12
5 Percentage of labourers employed in the subsistence sector to total employment initially	66.67	36.91	13.81	13.68
6 Rate of decline per unit of time in the share of labourers employed in the subsistence sector to the total employment	4.55	15.54	56.75	50.02
7 Percentage of resources flowing into the:				
(i) wage-goods sector	20.00	33.33	33.33	32.74
(ii) capital-goods sector I	28.00	25.56	19.26	18.90
(iii) capital-goods sector II	28.00	21.91	14.46	14.18
(iv) luxury-goods sector	24.00	19.20	32.95	34.18

Note: * Assuming that the marginal product of labour in the subsistence wage-good sector is negligible this will approximate 16.31.

CHOICE OF TECHNIQUE

Sen's theoretical formulation that the choice of technique which maximises profit also maximises rate of growth of produc-

tion (and, therefore, rate of growth of employment) implicitly assumes that rate of savings with respect to non-wage income (i e, profits) which, though is a policy variable, is not a function of labour-capital ratio and, therefore, not a function of rate of profit.[13] In our illustration, however, the rate of savings with respect to non-wage income are 0.40 and 0.42735 for choice 1 and choice 2 respectively. However, from the point of view of both welfare criteria and social justice, an increase in rate of consumption associated with a reduction of luxury-goods consumption is to be always preferred to a reduction in the rate of consumption associated with increase of luxury-goods consumption. However, our illustration also indicates that the decline of rate of profit consequent upon the increase in labour-capital ratio (associated with a decline in the subsistence sector in the economy) is also associated with a fall in the price of luxury goods and a fall in the value of consumption of luxury goods too. The decline in the price is likely to be more than the decline in the rate of consumption with respect to non-wage income. Therefore, adoption of choice 2 as a strategy of investment planning instead of choice 1 may not always indicate a fall in luxury consumption in real terms. Moreover, in a surplus labour situation, a fraction (may be even small) of non-wage income is spent to support the destitute, unemployed and disguised-unemployed in the subsistence sector of the economy.[14] Therefore, the rate of saving with respect to non-wage income is likely to go up with the reduction in dependence of workers in the subsistence sector of the economy.

However, in a capitalist economy even with a planning process for the management of the economy under state patronage, the economic interest of the ruling class will determine the floor level for the rate of saving with respect to non-wage income. There is a policy option here as well. As an increase in the labour-intensity in the luxury-goods sector will leave the rate of profit intact,[15] the rate of growth of output in the organised sector can be maintained at the same level by keeping the rate of saving with respect to non-wage income invariant. But as the initial labour absorptive capacity of the organised sector increases, both the rate of growth of the economy and the rate of decline of the size of the subsistence sector per unit of time, will register an increase as will be evident from the following numerical example associated with the increase in labour intensity in the luxury-goods sector.

$$(1 + p + q)(1 + r) = 9n \qquad \ldots(19)$$

If the choice of the organised sector is made in terms of equation (5), (6), (17) and (19) of our illustration (which is termed as choice 3), the rates of profit, savings with respect to non-wage income and growth of output in the organised sector remain the same as in choice 2, but the labour asborptive capacity of the economy in the organised sector and the growth of output in the economy as a whole improve (Table 2, columns 3 and 4).

There is yet another situation where the

TABLE 4: CORRELATION MATRIX

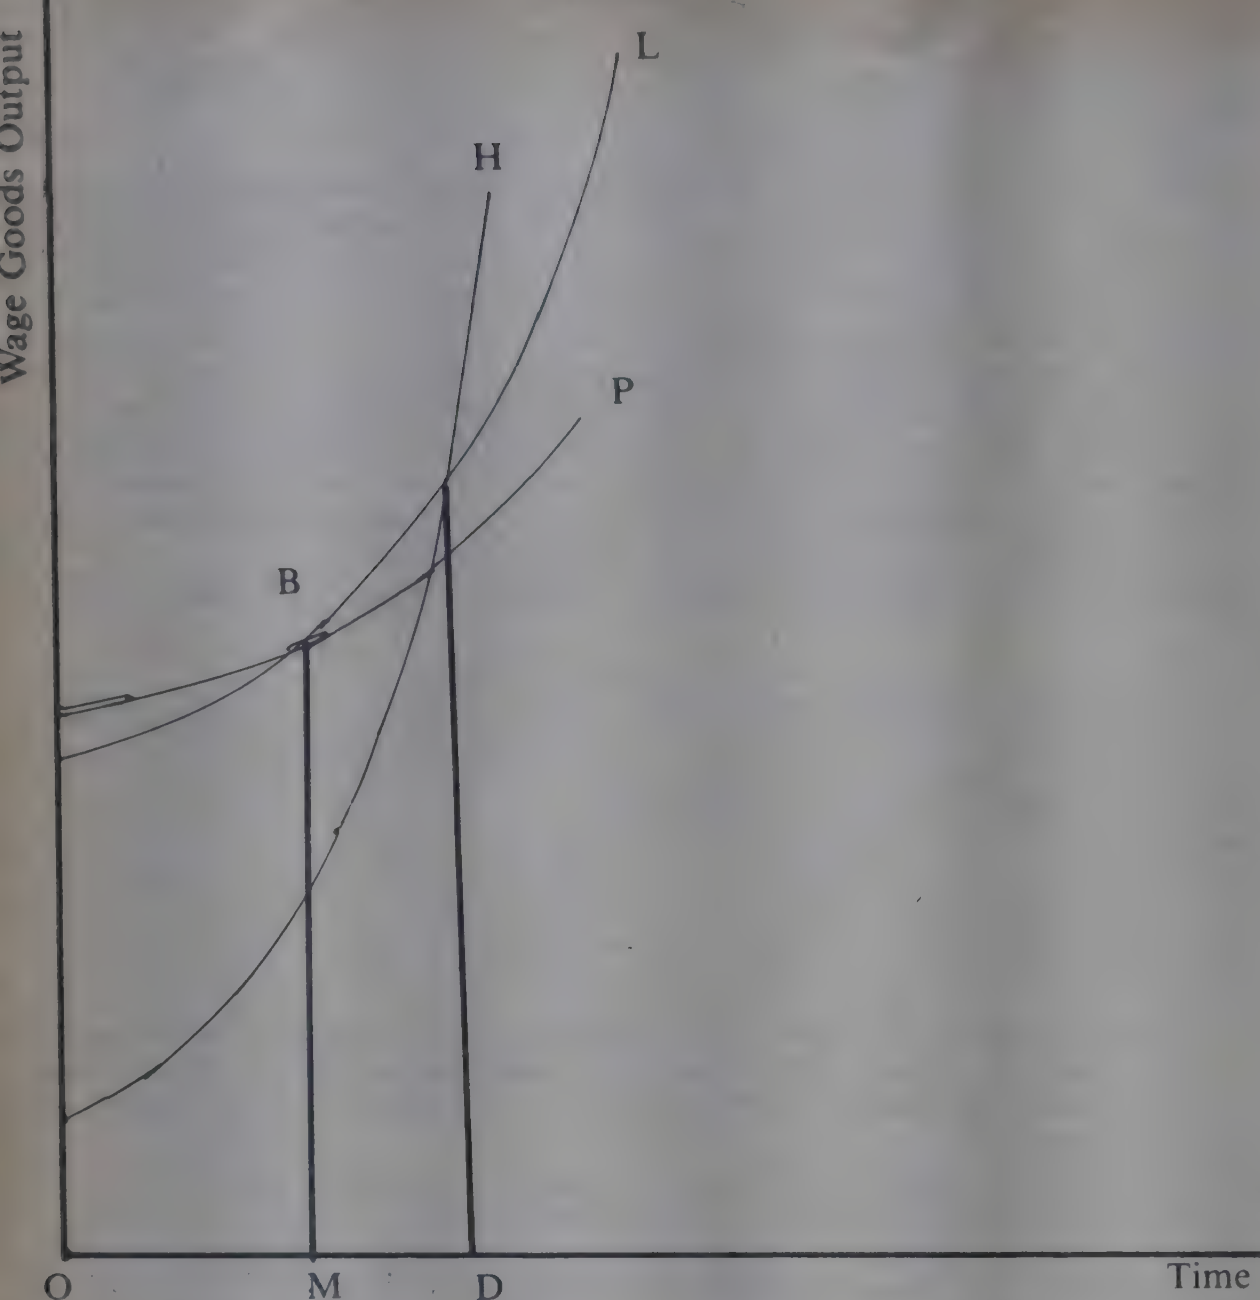
FIGURE 1



rate of saving with respect to non-wage income is not allowed to be increased at all (in our illustration it remains at 0.4 both for choice 1 and choice 4 given in Table 2) such that the rates of growth of output of the organised sector and of the economy register a decline consequent upon decline in rate of profit as a result of movement of the economy towards increased labour intensity in wage-goods and luxury-goods sectors. Even then the rate of decline in the size of subsistence sector will increase.

In this context it can be seen with the help of a simple diagram (see the figure) where curves H and L show the flow of the output of the wage goods of the organised sector and curve P defines the increase in labour supply over time.[16] Curve H represents capital-intensive technique with lower immediate output and a higher rate of growth of output than what is obtained by labour-intensive technique represented by curve L. The rationale related to choice of technique would be the one represented by curve L up to period OM and thereafter ever increasing capital-intensive techniques. Even if the curve P cuts the H and L curves at a point right of B, the technique to be preferred initially (up to period OD) is the one represented by curve L and thereafter the one represented by curve H.

It should be noted that planning for overall economic development envisages rapid eradication of surplus labour situation. Therefore, till the surplus labour situation continues, the technique of production in the organised sector, by and large, has to be labour-intensive and capital-output ratio almost constant. Only after the surplus labour situation comes to an end, the wage rate would be registering a continuous increase and so also the capital intensity in the economy. The phenomenon, then, will be characterised by falling rates of profit and growth of production. This will continue till production growth becomes equal to the rate of growth of labour supply (that is, almost equal to rate of growth of population). In theory, thus, there is no conflict between short period and long period employment objectives.

Though, the assumed magnitude of the input coefficients in the numerical examples may not conform to facts in the Indian economy, the five-sector model was meant to capture some important aspects of the Indian economy relevant to an evaluation of its investment planning strategy. In this model with some alternative technological choice, we could examine the implication of different planning strategies in terms of their impact not only on growth, but on such other important variables as employment, savings rates, flow of resources to different sectors of the economy, etc. The wage-goods sector is dominated by agriculture, whereas the capital-goods sectors I and II are dominated by traditional and modern capital-goods sectors respectively. Modern capital-goods sector can be said to include mainly petrochemical and electronic industries which are not only late comers in the Indian scenario but have a high import content, whereas the main base of traditional capital goods are minerals produced in this country, such as iron ore, coal, clay, limestone, etc.

Choices in Agriculture

In the context of increase in agricultural production, therefore, one can think either of an expansion of irrigation or increase in fertiliser use or increase in area under HYV cultivation. One can also think of mixing these three technologies in different proportions. It is worth noting that capital which is needed for irrigation is of a traditional variety where coal, iron and cement are the major inputs. On the other hand, fertiliser belongs to the petrochemical set. Although HYV has been successfully used with irrigation and fertiliser, it is generally more susceptible to pests than the non-HYV cultivation and, therefore, pesticide (a petrochemical product with high import content) has to be associated with it. Let us now examine the impact of these on employment and production using the state-wise data for triennium ending 1973-74 and 1983-84, given in Table 3. The multivariate analysis was done by pooling together time-series and cross-section data which gave us a total of 26 observations. The result of the analysis, given in Table 4, clearly indicates that elasticities of production and employment are higher in case of irrigation than in case of fertiliser use. There are other empirical evidences which are indicative of high labour absorptive capacity of irrigation.[17]

In view of these evidences and analysis, it can be argued that had we adopted a strategy of expansion of irrigation (shedding away our obsession regarding industrial development) in a big way right in the beginning of planning and allowed the percolation of fertiliser use and HYV cultivation in a normal way through the operation of market forces (instead of being pushed in the agricultural sector through subsidies and extension services), we would have by now achieved greater reduction in disguised unemployment, underemployment and regional economic disparity than what have been achieved on account of the adopted strategy related to choice of technology in agricultural sector.[18] The irrigation expansion strategy would have meant a higher flow of resources in the traditional capital-goods sector and lower in the modern capital-goods sector than what have been the case during the past about four decades of planning. A relatively higher expansion of traditional capital-goods sector where we had adequate experience and expertise would also have not only eased our foreign exchange problem but would have made our capital-goods sector, as a whole, more competitive and efficient than what is the situation today. Much of

our increasing trouble in the modern capital-goods sector is due to our inexperience in the field where the high rate of expansion has virtually prevented the process of 'learning by doing' and internalisation of the technology. This is partly reflected in an almost continuous increase in incremental capital-output ratio (ICOR) since the early fifties.[19] The sharp increase in ICOR should have appeared in the Indian scenario, but only after the subsistence sector would have been wiped out. What, however, lamentable is that these issues in the context of Indian investment planning were never ever adequately and scientifically examined by the professional bodies created to aid and advise the government on issues related to development planning in India.[20]

Legacy of Colonial Dynamics

The other neglected aspect in the context of investment planning in India was helplessness to devise a strategy to counterbalance the market forces making for increasing uneven regional growth in the economy (a legacy inherited as a consequence of colonial dynamics). Failure on this count is writ large on the face of the Indian economy even after about 40 years of planning.[21] There is yet another important lapse which negated the positive aspects of investment planning in India. This relates to complete failure to grapple with the problems created by the 'relation of production' in the context of the development of the Indian economy in general and the rural economy in particular.[22]

All these lapses had made a mockery of planning in India. The ever increasing inequality, uneven regional growth and unemployment (including disguised unemployment and underemployment) and vast areas of the economy sinking deeper and deeper into the quagmire of non-development, associated with feudal ethos and identities are the important causes of increasing organised violence in India.[23] The employment elasticity with respect to output has been declining over time and according to one estimate,[24] it has now touched as low a level as 0.23. Thus even with much applauded 6 per cent rate of growth of output in the economy (possibly more in the organised sector), employment growth in the organised sector (taken as a whole) would hardly be more than 1.5 per cent per annum during the Eighth Plan period. This clearly indicates that there is likely to be no dent in the increasing size of the subsistence sector in the foreseeable future in our country. In the backdrop of such and other evidences of the deepening of economic crisis, the planning exercise (for the Eighth Plan) showing a naive unawareness about the above mentioned theoretical and empirical aspects of development planning (which has remained neglected for too long), is indicative of professional bankruptcy in planning and a very pedestrian approach to development in India.[25]

Eat Now Pay Later

Impact of Rice Subsidy Scheme

Wendy K Olsen

The Andhra Pradesh rice subsidy scheme was mainly intended to be a visible, if small, gesture of generosity on the part of the ruling party in the state. This article examines the scheme in depth and shows how much of the cost has in fact been borne through growth in the state government's net indebtedness.

THE official brochure on the Andhra Pradesh rice subsidy scheme claims that "this is the most laudable scheme launched for eradicating hunger, deprivation and want from the poorest of the poorer sections of society".[1] A close look at the origin and nature of the scheme suggests that this claim exaggerates the scheme's effect on the poor. Besides providing a subsidy worth between Rs 9 and Rs 27 per household per month to recipient families (the lower figure applying to the poorest), the scheme has important indirect and long-term effects such as the crowding out of productive investment. Although ration card holders got a boost to their purchasing power when the scheme started five years ago, the same group must ultimately, if indirectly, bear most of the costs of the scheme.

The origins of the scheme, described in the first section below, reveal that it met other purposes besides the stated one of 'eradicating poverty'. The second section explains the nature and scale of the ration scheme, emphasising that it is not as progressive (i e, targeted) as its proponents claim. The benefits accruing to the poorest and less-poor households, to ration shop dealers and to rice millers are estimated in section three. In section four I have also tried to quantify the total cost of the scheme, compare it to alternative expenditures, and show that much of the cost has in fact been borne through growth in the state government's net indebtedness. Finally some indirect effects, particularly on rice consumers in neighbouring states, are discussed in the last section.

Widespread Subsidy

The story of the scheme's origin reveals that the rice subsidy's main purpose was never just to help the poor. Instead its main intention was to be a visible, if small, gesture of generosity on the part of the ruling party in the state. That token gesture would, party leaders hoped, ensure enough votes for continued power of the state over the voters. The state government's legitimacy is then enhanced by its electoral popularity.

Both Congress(I) and the Telugu Desam Party (TDP) thought to use this ploy.[2] Even in late 1982 the Congress(I), still holding the majority in the state legislature, considered introducing a state-wide rice subsidy. They initially claimed that such a scheme would not be feasible. But then the state Congress(I) government itself introduced a rice subsidy scheme with urban sales of 50 kg per household at three prices (common variety Rs 1.90 per kg, and fine varieties at a premium of 20 or 25 paise per kg), just at the end of 1982 before the elections. Hence ever since the present scheme's introduction in early 1983, both parties have claimed credit for initiating it.

TDP's election manifesto stated that "Telugu Desam will strengthen the public distribution system and will see that the essential commodities are made available to the people at very reasonable rates. It is the firm resolve of Telugu Desam to ensure sale of a kilogram of rice for rupees two." After winning power in 1983 TDP implemented the subsidy as promised. The new state government extended the subsidy to village people as well as urban residents.

One of the reasons for the scheme's popularity is that ration cards as well as shops actually have reached the most remote people of Andhra Pradesh—unlike many development schemes which, one way or another, have concentrated on central places. In addition within each village virtually every eligible household has a ration card, whereas many people who are 'eligible' (strictly speaking) for subsidised sarees/dhotis, for old-age pensions, and for housing subsidies, have not received these benefits.[3] The ration shops have reliably supplied rice to cardholders, with the leakage and corruption problems faced by civil supplies in other states kept to a minimum by the high visibility and local nature of the fair price shops. As Table 1 shows, AP has far more ration shops per person than its neighbouring states (one shop for every 1,600 people).

How was this 'populist' subsidy scheme born? Harriss found that "the public distribution system of grain tends to operate in south India according to a perverse and short-term logic".[4] Her studies of Tamil Nadu's experience suggest that the state procures *more* and distributes *less* grain during drought periods.[5] Andhra Pradesh's reaction to the 1973 drought perhaps fit this 'paradox' model,[6] but recent events do not. The doubling of the rice procurement in AP in 1982-83 came at a time of successive record crops, and distribution kept increasing over the drought years 1984-87 (see Tables 2 and 3). The mechanism here is not simply a reflex on the state's part to help consumers at the expense of producers whenever there is a drought. Instead drought, growth in agricultural output, and electoral politics interact with historical and local factors to determine the food policy at state level—which does nevertheless result in some perverse and illogical results.

In the case of AP, both the Congress(I) and TDP were prepared to promise some handouts to the poor in 1983. (The Left alternative in AP, the CPI(M), has been forced to go along with TDP policies by its ongoing electoral alliance with TDP involving seat allocations and mutual support.) N T Rama Rao and TDP boldly promised a bigger subsidy than Congress(I) had ever provided, and they won the 1983 election. When TDP's leading position in the state assembly was questioned in 1985, their strategy of combining Telugu nationalism with the extensive food subsidy paid off in a solid electoral victory. The Congress(I) has since been silenced from ciriticising the Rs 2/kg scheme because if it does, TDP will use this to their advantage by accusing the state Congress(I) of wanting to impose central government anti-AP policies on the Telugu people.

Hence a costly subsidy scheme has become entrenched in the state's budget (at the expense of other possibilities, as will be

Table 1: Scale of Grain Distribution in Four States, 1980 and 1985

State	Total Rice and Wheat Distributed ('000 tonnes)		Persons Per Shop in	Per Capita Distribution (kg)	
	1980	1985	1985	1980	1985
Andhra Pradesh	548	1353	1,600	10.3	23.3
Andhra Pradesh (including APSCSC)	548	2200	1,600	10.3	37.9

seen below). The scheme is used as ongoing propaganda for TDP. Several colourful pamphlets advertising the scheme, each with chief minister N T Rama Rao's photo on the front, are available free from the AP State Public Relations Office. The scheme is nicknamed 'Anna-Varam' in these pamphlets, a pun meaning both 'big brother's gift' and 'rice gift', with the word 'varam' (gift) having a religious connotation. (Brown's Telugu-English dictionary defines 'varam' as "a boon or blessing sought in prayer, a divine gift".)

TDP's 'populism' and regionalism are also a convenient way of legitimising a regime which in many ways represses the very people—'the poorest of the poor'—whom it claims to represent. Legislation exists which would enable these people to reach a higher standard of living through their own efforts—the minimum wage and land ceiling laws. But the minimum wage laws are openly flouted, especially in agriculture where the poorest workers receive the lowest possible wages. The land ceiling act, though an effective deterrent to land accumulation by rich individuals, is also bypassed as rich farmers allocate land to various relations (on paper) but actually till holdings far over the limit. TDP has done nothing toward implementing these basic progressive laws.

Instead the ruling party administers and protects the system which thrives on the existence of unemployed and underemployed workers who must accept low wages or starve. TDP brutally suppresses the efforts of workers to organise for land reform and higher wages. A case in point is the way TDP has given the police free rein to attack supposed 'naxalites' whenever they suspect that villagers are organising against landlords.[7] At present the state can accuse anyone of being a terrorist and have him or her killed in an encounter or even killed in jail, regardless of whether the person has broken any law.[8] In the tribal areas where many agitators for land reform work, TDP are now proposing that the laws against land purchases by non-tribals be abolished.[9] In the biggest strike since TDP came to power, NTR personally ordered the jailing of the leaders of the state government non-gazetted officers' unions at the end of 1986. The solid strike of 6,00,000 NGOs ended when the union leaders, no doubt under threat of re-arrest, accepted a plan that left most members worse off.

These anti-people actions can only be reconciled with TDP's populist rhetoric if we recognise that the party stays in power by balancing the two aspects of its regime—the growing welfare state which substitutes for economic growth, and the authoritarian regime which silences all genuine opposition. Such an authoritarian bourgeois state could only retain power and popularity in the absence of a viable Left alternative. And indeed, the CPI(M) which could have been offering an alternative programme (eg, starting with a demand for "jobs for all, not charity for all", as one activist suggested) has been silenced by its electoral pact with TDP. The CPI(ML), which is also popular among radicalised youth, is ruining its chances by engaging in terrorist tactics and indulging in revenge murders. Given a choice in elections among various bourgeois parties, each representing one section of the ruling class, it is not surprising that the voters of AP prefer the one which at least offers some concrete, immediate benefits. Most voters have no expectation (as yet) of any more fundamental change in society.

Initial proposals for a rice subsidy scheme were heavily 'targeted', so that a small amount of subsidised rice (10 kg/month) would go to the poor families with incomes below Rs 3,600 per year. Such a scheme would have affected some 8 million households out of AP's (then) 11.4 million households. In 1983 the result would have been about 1 million metric tonnes (mmt) of rice distributed over both rural and urban areas at a cost of some Rs 72 crore (Table 4).

On taking power, however, NT Rama Rao, with a calculated benevolence, announced that households with incomes up to Rs 6,000 per year would be eligible for the scheme,

(Various Options)

	Eligibility		Quantity		Subsidy		Result
	Income Limit (Rs/hh)	No Green Cards (m)	Ration Size (kg/hh/mo)	Total Issues (mmt/Year)	Issue Price (Rs/kg)	Subsidy Per Kg (Rs)	Annual Cost (Rs crore)
1983-84 limited scheme	3,600	8	10	0.96	2.00	.75	72
1983-84 actual scheme (approx)	6,000	11	20	2.64	2.00	.75	198
1986-87 estimates for limited schemes:							
(a) cut subsidy size*	6,000	11	20	2.64	2.50	.75	198
(b) *and* cut ration	6,000	11	10	1.32	2.50	.75	99
(c) *and* cut eligibility	3,600	8	10	0.96	2.50	.75	72
(d) 'targeted'—cut eligibility only	3,600	8	20	1.92	2.00	1.25	240
1986-87 actual scheme (approx)	6,000	11	20	2.64	2.00	1.25	330

Note: Costs are borne by both centre and state. Figures are illustrative not actual (see text). Subsidy size includes negative buy-sell margin and costs per tonne of FCI and APSCSC operations.

* E g, line 3 shows that the costs of the scheme could stay the same if the issue price were raised over time.

i e, for a green card. In addition a ration of 5 kg per person up to a maximum of 25 kg per household replaced the initially rigid ration quantity of 10 kg/hh. The scheme thus became both more extensive and more generous. As a result the cost rose to about Rs 200 crore a year.

The extension increased the scheme's impact most in rural areas, where 80 per cent of households are eligible under the higher income limit (Table 5).

The hypothetical figures in Table 4 show the effect that policy changes regarding eligibility, ration quantity and subsidy have on the overall cost of the programme. A targeted, limited scheme would cost no more now than it did in 1983-84. But TDP has kept the issue price fixed at Rs 2/kg, while rice prices have risen by some 6.7 per cent per year in line with inflation.[10] The number of ration cards (both yellow and green) has consistently exceeded the number of households in AP (Table 6), reaching a peak in 1986-87 when the number of cards was reported at 13.9 million and the number of households was 12.2 million.

It would be very difficult to reduce the income-eligibility limit now, after so many families have grown accustomed to having the rice subsidy. Their food entitlement, to use Sen's phrase, increased with the introduction of this scheme, and any new cut in their entitlement will no doubt generate strenuous objections.

Perhaps the only politically feasible ways of reducing the scheme's cost at this point would be (i) to reduce the size of the subsidy by raising the issue price (e g to Rs 2.50/kg as suggested in line 3 of Table 4), and (ii) to reduce the ration allowed each household (see line 4 of Table 4). These measures would however produce a direct reduction in the 'poorest of the poor's' purchasing power over rice. A third option would be to introduce a middle level of eligibility for households whose annual incomes are between Rs 3,600 and Rs 6,000, and reduce the rice subsidy available to this group.

These 'options' are mere speculation, not practical political proposals. Similarly, the claim that "it is possible to improve the aggregate welfare without involving additional expenditure on rice subsidy by mere transfer of a part of the ration presently enjoyed by the non-poor to the poor"[11] ignores the fact that the ruling class for its own reasons will not allow such a change. Its electoral support comes from both the poorest and the 'non-poor' sections of society. These 'non-poor' include literate, often unionised urban workers as well as TDP's own class base of large farmers and small capitalists. In terms of electoral strategy, it is better for TDP to give small symbolic handouts to all these groups than to openly favour one over the other. Hence the impossibility of 'targeting' the scheme in a progressive way.

Last year the state attempted to reduce the issue of rice on bogus and ghost ration cards. At that point the number of ration cards exceeded the number of households in AP by nearly 15 per cent (Table 4), and it was suspected that many relatively rich families held both a rice card and a sugar card.[12] In the first quarter of 1987 the old ration cards were replaced by mandatory photo ration cards. The new cards are actually small books which have space for five years' ration records, and the household head's photo must be attached. For many of the poorest families, these cards are a constant reminder of TDP's 'rice-gift'. Though city people may scoff, this is often the first photo ever taken in poor families. The photo ration books are seen as an advertisement of TDP's benevolence to people who are otherwise remote, illiterate, and hard to reach.

Provision of the new cards was paid for by the state, but the photos had to be paid for by the recipients. The cost seems small (Rs 5 was paid in Chittoor district villages) and the village assistants organised photographers to spend a day in each central village. However one photo per household adds up to a huge demand, and I suspect that the photo ration card scheme was encouraged if not proposed by the photo studio owners who stood to gain most from it.

Through the issue of photo ration cards the number of rice ration cards was reduced from 10.4 m to 9.5 m, and the total number of cards fell by 10 per cent to a figure near, though still above, our best estimate of the number of households in the state.[13] Though we may hope that now bogus cards and double cards have been eliminated, the ironic secondary impact of photo ration cards will be to regressively target ration rice away from the 'poorest of the poor'. To replace a ration card or get a new one for newly formed or migrant households, villagers will have to pay for transport to town photo shops as well as pay for fresh photos before a new ration card can be issued. Yellow card holders can easily bear these costs but many green card holders cannot. With some 2,80,000 new households formed each year, a gradual bias in the scheme away from remote, poor and migrant families may develop.

Differential Subsidies

Ration rice is not an addition to the diet. It is a fungible commodity bought cheap. Hence it is best to think of the ration as a subsidy and measure its value in cash terms. Its impact on diets and nutrition depends wholly on consumer choice at the margin (i e, on income elasticities). The savings on rice can be spent on various foods including more rice, oil, sugar, alcohol, etc, as well as on non-food items such as medicine, travel, or clothing. To measure the impact of the rice scheme on rice consumption and nutrition, post-1983 studies of consumption patterns among green card holders can perhaps be compared with existing data on pre-1983 diets.[14] In the meantime, we can estimate the impact on purchasing power for all families even in the absence of full data on incomes and the income elasticity of demand for rice. The size of the subsidy from the household's point of view depends on (a) how much grain they get (20 kg, 25 kg, etc); and (b) the relevant opportunity cost of rice, i e, what they would have spent on grain without the ration rice.

Ration shop sales to green (rice) card holders average 18 kg per month per card. That's 3.7 kg per capita per month, using an average household size of 4.9 persons. However household rice consumption ranges from 45 to 70 kg per month for an average family, depending on class, diet, and ages of family members. The ration is thus somewhere between 25 per cent and 40 per cent of recipients' consumption, and is well over the national average.[15]

The savings on the 18 kilos in 1986-87 was Rs 27 per month for those families that would have bought an equivalent quantity

Table 5: AP Ration Cards by Colour and Location in 1985

(Per cent)

Card Type	Urban	Rural	Total
Green (rice)	16	60	76
Yellow (sugar)	10	14	24
Total	26	74	100

Source: Radhakrishna and Indrakant, 1987. In 1985 there were a total of 13.3 million cards in existence.

Table 6: Number of Ration Cards in Andhra Pradesh

(In millions)

Year	Green Cards	Yellow Cards	Total Cards	AP Population*	No of Households*
1982-83			12.562	54.8	11.1
1983-84	10.864	2.667	13.621	56.1	11.4
1984-85	9.648	3.130	12.778	57.5	11.7
1985-86	10.103	3.423	13.626	58.8	12.0
1986-87	10.432	3.469	13.901	60.2	12.2
1987-88	9.514	3.034	12.548	61.6	12.5

Note: There were no green cards in 1982-83. Green cards came into being from April 13, 1984. The 1987-88 figures reflect the number of photo ration cards issued during January-April of 1988.

THE STANDARD MILLS COMPANY LIMITED

NOTICE

IT is hereby notified for the information of the public that **The Standard Mills Company Limited** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/unit/division. Brief particulars of the proposal are as under:

1. Name and address of the applicant : **The Standard Mills Company Limited**
   Mafatlal Centre, Nariman Point,
   Bombay - 400 021.
2. Capital structure of the applicant Organisation : Authorised Capital: Rs. 15,00,00,000/-
   Issued & Subscribed: Rs. 11,05,55,300/-
3. Management structure of the applicant Organisation indicating the names of the Directors including Managing/Whole-time Directors and Manager, if any. : The Company is managed by the Whole-time Directors, subject to the superintendence, control and direction of the Board of Directors of the Company, consisting of:
   1. Shri Rasesh N. Mafatlal, Chairman
   2. Shri V. Ramadurai, Whole-time Director
   3. Shri C.C. Maniar, Whole-time Director
   4. Shri Russi Jal Taraporevala
   5. Shri Harish Mahindra
   6. Dr. F.A. Mehta
   7. Shri J.P. Thacker
   8. Shri V.C. Vaidya
   9. Shri Pradeep R. Mafatlal
   10. Shri M.L. Apte
   11. Shri R.C. Shah
   12. Shri A.C. Muthiah
   13. Shri R.S. Peddar
   14. Shri Deepak S. Parekh
4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : The proposal relates to the establishment of a new undertaking
5. Location of the new undertaking/unit/division : Dewas (District—Dewas)
   Madhya Pradesh
6. Capital structure of the proposed Undertaking : Same as per item No. 2
7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:

Name of the goods/articles	Proposed Licensed Capacity	Estimated Annual Turnover
Nonwoven Structures	3000 m.t. per annum	Rs. 3000 lacs

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not applicable
9. Cost of the Project : Rs. 2340 lakhs
10. Scheme of finance indicating the amounts to be raised from each source :

	Rs. in lacs
Term Loans/Debentures:	1000.00
Internal Accruals:	550.00
Foreign Exchange Loans (from Financial Institutions):	790.00
TOTAL:	2340.00

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this Notice, intimating his views on the proposal and indicating the nature of his interest therein.

For **THE STANDARD MILLS COMPANY LIMITED**

Bombay-400 021.

of rice in the market if the subsidy were not available. The ration rice is decent coarse rice which cost Rs 3.50 per kg in the market over 1986-87. Rs 27 is the difference between the cost in the market (Rs 3.50 × 18 kg = Rs 63) and the cost in the ration shop (Rs 2 × 18 kg = Rs 36). The subsidy is thus Rs 6.75 per week or Rs 324 per year, for such families.

However, this calculation applies only to those farmers, landlords, merchants, and salaried families who buy good rice at the margin. Coolies buy very cheap grains, especially broken rice (nuukulu), at much lower prices than Rs 3.50. Their opportunity cost in 1986-87 was Rs 2.10/kg for brokens, Rs 2.00/kg for ragi, Rs 1.90 for bajra, etc. They do also buy some whole coarse rice at Rs 3.50/kg, so consider for them an average price of grains bought on the market of Rs 2.50/kg.

Then the subsidy for worker families comes to only Rs 9 per month per household. (Market price Rs 2.50 × 18 kg = Rs 45, minus ration shop cost Rs 2 × 18 kg = Rs 36, gives Rs 9). That is Rs 2.25 per week, or Rs 108 per year. By way of comparison, for this amount these families could buy perhaps one cheap saree and one coarse lungi cloth.

This is a substantial subsidy programme and the coverage is extremely widespread even in remote areas. As a rough figure we can average the two opportunity cost calculations given above to say the ration rice is worth on average Rs 5 per week per household.[16]

A similar figure was reported in a study of urban green card holders in Vijayawada. The study found the value of the subsidy to be Rs 20.57 per month, making the average benefit calculation "on the basis of difference between the subsidised rice price and the private market rice price."[17] The relevant open market rice price was taken as Rs 3.00/kg, and the question of coarse grains or broken rice apparently did not arise in the town.[18] That study noted a decrease in the subsidy value per household as per capita income rose. Families earning Rs 50-100 per capita per month (the lowest income group) gained Rs 20.92/month while those with the highest per capita incomes gained Rs 10 to Rs 17/month from the scheme. The negative association found between subsidy value (per hh) and per capita income is due to the fact that large households have relatively low per capita income but get a larger ration, at least up to the 25 kg/hh limit. The per capita subsidy value did not vary systematically with per capita income among the 145 households surveyed in Vijayawada. (Figures broken down by household income are not available.)

Apart from the differential in the value of the subsidy in opportunity cost terms, the ration rice is also causing substitution away from coarse grains on the part of the rural poor. In western Chittoor district *sangati* (cooked rice and ragi balls) is now made in a proportion of one ragi to four rice measures, whereas historically and even in the recent past it was made with one part ragi to one part rice. Poor workers may as well take up the ration as buy the cheap, nutritious coarse grains, so that rice now takes up a larger proportion of their cereal consumption.

Many large farmers, landlords, and merchants have green rice ration cards. Data from a survey of over 5,000 people in western Chittoor district give an idea of the distribution of ration cards among classes in one rural area. Table 7 shows that 25 per cent of landlords (defined as big landowners who oversee but do not physically do agricultural work), 44 per cent of merchants, and 40 per cent of families with salaries such as peons, teachers, police, etc, had rice ration cards in 1986. In fact the landlord households had an overall ration card coverage (rice plus sugar cards) of 105 per cent. In other words several families had two cards and freely admitted it.

These families and the large farmers use the ration rice to supplement their own diets: they can then afford even more fine rice and luxury foods such as ghee. They use the ration rice to make rice flour, iddli and dosa which they eat for breakfast.

Most of all, the better-off village families use the ration rice to feed the workers their lunch-time meal. Most *sangati* (in the area I lived, at least) is cooked by landlords' and farmers' wives for coolies to eat. It is they who are changing the composition of *sangati* such that ragi is becoming a mere flavouring or additive to the meal. Thus while the workers are demanding more cash wages in order to buy their rice ration, the employers are giving more workday meals and they reduce the daily wage by about one rupee to compensate for the 'free' food.

Table 8 shows that in the survey area, 36 per cent of households had over five members but were eligible for only 25 kg per month. For large households the impact of the ration goes down with household size as a higher proportion of grain must be purchased or consumed out of own production. However nuclear families of four or five members are much more common among the coolies than among wealthier classes, as both our survey in Chittoor district and the official census have found.[19] Hence joint farming families suffer most from the ceiling on ration supplies. It remains to be seen (perhaps in 1991 Census) whether the scheme itself noticeably encourages splitting of families into nuclear households.

So far we have seen the scheme's extensive effects on large numbers of people. But the relatively small group of fair price shop dealers get a very concentrated 'subsidy' through the buy-sell margin on ration rice. This profit is intended to provide "the potential for stable self-employment for educated youth in their own or neighbouring villages. This promises the emergence of a new small-entrepreneurial class in the rural areas."[20]

With this ideal in mind there are official policies (and in some cases quotas) regarding preference for educated unemployed rural youth as well as for SCs, tribals,

TABLE 8: DISTRIBUTION OF HOUSEHOLDS BY SIZE (ALL FAMILIES)

No in Households	Per Cent of Households	Size of Ration (kg/month)
1	3	5
2	10	10

women, and handicapped people. In practice the minorities are poorly represented among fair price shop dealers. Instead most rural dealers are either landlords or merchants to begin with. Of the present 33,688 ration shops, over 30,000 existed and had dealers in 1983 when TDP came to power, so that TDP's reservation policy for dealers has had only a marginal effect. (Among our 1,092 surveyed households three ration shops were operating, two held by merchants with their own separate shops next door, and one by an absentee landlord who is assistant public prosecutor in a town 20 km away, who paid a manager to handle the ration shop in his empty village house.) Many dealers are also staunch TDP supporters.

But would a 'small-entrepreneur' really deal in goods at fixed prices with fixed quantities available only when officially released by both central and state governments? Would grain 'entrepreneurs' really thrive in a market where "the government has also decided that there shall be no private stockist for rice. Accordingly, all private stockists for rice have been eliminated by 31.12.85"?[21]

No; entrepreneurs make their niche in free markets and thrive on making their own decisions. This is rather a type of state capitalism, where trading profits (or in this case losses) are allocated by official policy—and where even without corruption some officials do very well for themselves. In the present case a few calculations suggest that rural dealers earn some Rs 4,400 per year per shop each, and urban dealers Rs 8,200 each on the Rs 2/kg rice alone.[22]

This profit comes before the dealer sells off or uses the 50-plus second-hand gunny bags he or she gets every month free along with the rice. The dealers also get margins on sugar, oil, kerosene, wheat, and non-ration rice (which goes to yellow card holders). Many dealers also benefit from free market sales or exchange of any goods not taken up by card holders.

The AP government has estimated that "on an average, the net profit earned by a rural fair price shop dealer with 400 cards is around Rs 750 per month, while that of a fair price shop dealer in city areas with 600 cards is around Rs 1,950 per month", taking all the commodities into account.[23]

The proceeds must then cover the costs of the operation—rent, labour, interest on debt and inventory, etc. But the rural dealers pay no transport costs on ration rice. It is delivered to their door. And the urban dealers get an exra Rs 4.19 per quintal to cover the cost of getting the rice from depots in the same town to their shops. Finally, there is nothing to stop the ration shop dealers' families having other jobs or businesses—most shops are closed most of the time anyway, waiting for the rations to be delivered.

The cost of the middlemen's commission is 39 crore per year, or about 13 per cent of the Rs 300 crore spent by the state on this programme at present.[24] Another group which has gained indirectly from the policy is the rice millers. At first glance the procurement policy seems like a tax on millers, since they have to provide up to 75 per cent of their output at below-market prices (Table 9). Millers make up for any loss in several ways, primarily by selling the remaining 25 per cent at a premium (often outside the state) and by paying farmers less for paddy in the first place.

The little evidence available on rice mills shows massive profits accruing to mill owners. Among 58 mills surveyed in three Telangana districts (unfortunately not a random sample across the state), only 29 per cent of the millers' gross margin went toward processing costs[25]—the rest was profit. With processing costs (including parboiling over 50 per cent of the rice in the case of these particular mills) of only Rs 18/quintal these 58 mills earned another Rs 65/quintal on average in profit.[26]

On the basis of that survey, Radhakrishna and Indrakant went on to assume in their model that millers keep their profit margin constant. In other words they pass the whole of the procurement tax on to their paddy suppliers. It is also possible that the millers absorb any windfall gains but are unwilling to let their profit margins fall (i e, the margin is sticky downward). Public complaints by the millers' associations notwithstanding, millers' profits on the whole have not been threatened by the Rs 2/kg scheme or the procurement drives.

One certain effect of the intervention system is considerable rice price stability. Free market rice prices in AP at all levels (wholesale, retail, and in different districts) vary much less on a seasonal and irregular basis than the prices of other major crops. (I have computed seasonality and irregularity indices using Kahlon and Tyagi's method for ten crops in various centres using data

from *Agricultural Prices in India*. The data support this claim, though of course the two- and three-season cropping pattern for rice also reduces paddy prices' seasonality.)[27] Millers, in particular, face an assured market at fixed prices for over half of their output—a position many other cash crop processors such as edible oil millers would envy.

WHO PAYS THE PRICE?

In a recent incident TDP admitted publicly that the scheme will cost the state government Rs 300 crore this year.[28] On July 4, 1988 the state let it be known that it would no longer sell rice to yellow card holders in the three cities at Rs 2.65/kg. Then suddenly by that evening the decision was changed and instead a price rise to Rs 3.50/kg was laid on this section of recipients (i e, urban households with incomes over Rs 6,000/year). Every newspaper and TV bulletin reassured the yellow card holders that they could still get ration rice but only at a price that covered APSCSC's costs. The savings from cutting off this group's rice ration completely was admitted to be only Rs 12.2 crore (4 per cent of total spending on the rice subsidy).[29]

The ration scheme costs are high because it is extensive and heavily subsidised. The costs are of two types: First, a negative buy-sell margin of some Rs 68 per bag of rice (Rs 260/quintal APSCSC purchase price minus Rs 192/quintal paid to APSCSC by FPS dealers); and second, the various costs borne by the state government. These include storage, administration, gunny bags, fungicides, transport, capital investment in godowns and lorries, the vigilance unit, and last but not least interest on debts and inventory.

Unfortunately Andhra Pradesh is not publishing data on the breakdown of costs it incurs in handling grain. The *State Administrative Report (SAR)* of the APSCSC is the closest thing to an annual report which can be found. The *SAR* goes only so far as to state the overall 'subsidy on rice' which it counts as separate from 'direction and administration". In other words it uses the same headings found in the budget documents of the state without showing the breakdown of expenditures. Table 10 shows that the budgeted expenditure on civil supplies reached Rs 285 crore for the year 1988-89. No doubt this is the basis for the round Rs 300 crore figures reported in the press.

In addition the Food Corporation of India (FCI) bears a portion of the costs, since rice re-allocated back to AP from the central pool (which never physically leaves AP anyway) is itself subsidised. The food subsidy nationally given to the FCI amounts to Rs 2,300 crore (1987-88), but it is not clear how much of the subsidy is received by AP.[30] The allocation of costs between state and centre is determined mainly by the issue price at which FCI sells rice to the states (Rs 239/quintal for common variety in 1987-88), but there is also the question of how to allocate FCI overheads among the states.

To adequately assess the scheme it would be necessary to know APSCSC's processing, transport and overhead costs per tonne of rice as well as the interest payments made and the level of outstanding debt. Only then could the efficiency of the state in providing grain be judged.

One contentious issue is that the FCI borrows from the Reserve Bank of India (RBI) at 10 per cent per year whereas the APSCSC (like someone caught with an overdraft instead of a loan) pays 17 per cent.[31] APSCSC is likely to be paying 17 per cent on a minimum of 90 crore a year (Rs 1.3 crore a month). One report stated that the RBI charged 17 per cent "on the food credit of about Rs 130 crore" taken by the state government to buy rice from millers.[32] However this figure is above the current limit of Rs 90 crore placed on APSCSC RBI borrowings by central government. This year the government requested the APSCSC's cash credit limit at RBI to be increased to Rs 150 crore and to be loaned at concessional interest rates.[33]

The subsidy provided by the state may not be covering APSCSC's costs each year. In July 1984 the authorised share capital of APSCSC, subscribed by the state government, was raised from Rs 3 crore to Rs 10 crore.[34] The injection of Rs 7 crore from state funds was probably in order to enable the APSCSC itself to borrow more from various sources. It doesn't seem to have been spent on assets: the department's capital expenditure (July 1, 1985 to March 31, 1986) was only Rs 2 lakh compared to budgeted outlays of Rs 152 lakh.[35]

Subbarao found that in 1985-86 the cost to the state for providing one rupee worth of subsidy was roughly one rupee, and he has pointed out that it would be more efficient to distribute the subsidy in some cheaper way.[36] The cost of providing each

TABLE 10: CIVIL SUPPLIES BUDGET ALLOCATIONS 1983-84 TO 1988-89

(Rs crore)

Year	Direction and Administration	Subsidy on Rice	Recoveries (Suspense Credits)	Total
1983-84	4.21	95.75	—	99.96
1984-85	4.58	160.51	—	165.09
1985-86	5.14	160.04	—	165.18
1986-87	8.38	180.84	—	189.22
1987-88	5.44	500.00	250.00	255.44
1988-89	7.10	556.76	278.38	285.48

Notes: These allocations are over 99 per cent non-plan expenditures. 'Recoveries' or 'suspense credits' is a category of civil supplies income not found in the earlier budget document. Presumably both gross expenditure and expected receipts have been reported. The fact that exactly half of gross expenditure for 1987-88 and 1988-89 is expected to be covered by receipts (recoveries) suggests that these figures are rough projections.

Sources: 1983-84 to 1985-86 data: *Government of Andhra Pradesh Budget Estimates* (non-plan and plan). For the year 1985-86, Vol III, Parts I and II, especially p 489. Later data: *Government of Andhra Pradesh Budget Estimates* 1988-89, Food and Agriculture Department, Vol III/12 (July 1988).

NOTICE

It is hereby notified for the information of the public that **Vam Organic Chemicals Limited** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of new undertaking/unit/division. Brief particulars of the proposal are as under:-

1. Name and Address of the Applicant : **Vam Organic Chemicals Limited**, Bhartiagram, Gajraula, District Moradabad, Uttar Pradesh.

2. Capital structure of the applicant organisation :

	Equity	Preference
	(Rs. in lakh)	
a) Authorised	1460.00	40.00
b) Issued and Subscribed	516.42	38.50
c) Paid up	516.23	38.50

3. Management structure of the applicant organisation indicating the names of directors including managing director/wholetime director and manager, if any : The company is managed by the Board of Directors consisting of

Shri M L Bhartia	—	Chairman
Shri S S Bhartia	—	Managing Director
Shri H S Bhartia	—	Wholetime Director
Shri P K Khaitan	—	Director
Shri J B Dadachanji	—	Director
Shri L Ivnas (Alternate Shri M T Shah)	—	Director
Shri H J K Klouman (Alternate Shri A T Shah)	—	Director
Shri S S Kanoria	—	Director
Shri A Ray	—	Director
Shri R K Bhargava	—	Nominee Director (PICUP)
Smt Sunanda Prasad	—	Nominee Director of (UPSIDC)
Shri Lalit Srivastava	—	Nominee Director of (UPSIDC)

4. Indicate whether the proposal relates to the establishment of new undertaking or a new unit/division : New Unit

5. Location of the new undertaking/unit/division : Gajraula, District Moradabad, Uttar Pradesh.

6. Capital structure of the proposed undertaking as mentioned in Sr. No. 2 : To be decided later in consultation with financial institutions/merchant bankers.

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate:
   (i) Name of goods/articles and proposed licensed capacity : Monochloro Acetic Acid, 5,000 MTA
   (ii) Estimated annual turnover : Rs. 12 Crores

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not Applicable

9. Cost of project : Rs. 5 Crores

10. Scheme of Finance, indicating the amounts to be raised from each source :

Equity	Rs. 1 Crore
Rupee loans	Rs. 2 Crores
Debenture	Rs. 2 Crores
	Rs. 5 Crores

Any person interested in the matter may make a representation in quadruplicate, to the Secretary, Department of Company Affairs, Government of India, Shastri Bhawan, New Delhi within 14 days of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

FOR **VAM ORGANIC CHEMICALS LIMITED**

rupee of subsidy in 1987-88 has risen to Rs 1.31 (assuming Rs 240/year/hh subsidy value going to 9.514 m green card holders at a cost of Rs 300 crore). Distributing cash would be cheaper than the rice ration-scheme—but it would lack the symbolism and political side-effects of 'anna-varam'.

When we imagine future reductions in the rice subsidy, the alternatives are not only 'no subsidy', but also other ways the state could be spending its funds. For instance, the rice subsidy is more than the entire state expenditure on public health: Rs 300 crore spent on the rice scheme compared with Rs 100 crore on urban health, Rs 26 crore on rural health, Rs 16 crore on medical research, Rs 48 crore on public health, and Rs 39 crore on family welfare.[37] The state expenditure on water supply and sanitation (both urban and rural) is only Rs 125 crore, even including a big rise in urban water supply costs due to drought in 1987-88. State spending on the AP State Electricity Board was Rs 170 crore in 1987-88. The secondary benefits of spending more on health, water supply and power and less on rice subsidy could perhaps have been great, especially during the recent drought when these services were under pressure. Another contrast is between education spending and the rice subsidy. A widening of educational opportunities for village people could benefit them in more permanent ways than the food subsidy has, by making them better able to compete for jobs and improve their agriculture. Yet the entire cost of elementary education in AP was Rs 343 crore in 1987-88, just over the cost of the rice subsidy. Spending on secondary education was Rs 210 crore, university and higher education Rs 138 crore, and adult education a pittance at Rs 6 crore. These expenditures have in fact risen in real terms since 1983-84, but a possibility of improvement and growth in the state education system has been missed. Many teaching posts have been going empty because of the state's growing financial crisis.

To understand the nature of this crisis, the rice scheme must be considered jointly with the increasing size of the state's annual budget over the past five years (Figure 3). Revenue spending will be 150 per cent higher in 1987-88 than it was in 1982-83 (79 per cent higher in real terms) (see Table 11). This big increase has been financed partly by an increase in tax revenues but has also been accompanied by successive state budget deficits. As a result, the state's outstanding debt has increased, and spending on capital investment has been relatively squeezed by the increases in both interest payments and the rice subsidy costs. Some American economists like to point out that "there ain't no such thing as a free lunch." The saying holds true for Andhra Pradesh as everywhere else, and the rise in state spending has indeed been covered through the following mechanisms:

(i) Rise in taxes. Tax revenues from the state sales tax, excise tax, vehicle tax and other taxes have all risen by 50-70 per cent in real terms over the last five years (Table 11). Property tax revenues have risen less than other categories of taxes (by 7 per cent in real terms). Together these two factors suggest that the changing tax structure is becoming more regressive, but the incidence of taxes on different income groups would have to be analysed before this suspicion could be confirmed. Meanwhile the state's share of central taxes has also risen considerably. Overall tax revenues rose by 120 per cent (58 per cent in real terms) over the five-year period considered in Table 11. Thus the public sector itself has grown considerably in AP since TDP came to power.

(ii) Successive budget deficits. As Figure 3 shows, after TDP was elected the state budget went into deficit for the first time in years. Recurring deficits averaging Rs 118 crore per year over the period 1983-84 to 1988-89 have helped to pay for the growth in expenditures under TDP.

(iii) Borrow now to pay later. A lot of the new state debt has been in the form of open market borrowings. Outstanding open market loans rose by 91 per cent in real terms from 1982-83 to 1987-88, while debts due to central government rose by 36 per cent and loans from autonomous bodies (including the RBI) rose by 23 per cent in real terms over the same period. Net outstanding debt now stands at Rs 4,200 crore ($ 2.78 billion at current exchange rates), over double what it was in 1982-83 (Table 12). The interest and debt servicing payments have risen to Rs 315 crore, ironically a figure comparable to the entire food subsidy cost. These interest payments have doubled in real terms in five years and are a major expense of the present state government.

(iv) Reduce other expenditures. In the midst of this boom in expenditures, the importance given to the power and irrigation

sectors has fallen relative to the consumer subsidy. Table 13 shows that although all subsidised sectors are getting more cash than ever before, the food subsidy has grown most of all. It has risen from 2 per cent of subsidy spending in 1982-83 to 37 per cent in 1986-87, while electricity and irrigation subsidies fell from 92 per cent to 59 per cent of subsidy spending.[38] Other areas which might have benefited from new subsidies, such as education and industry, have made no headway at all (Table 13).

But the state government's decision to borrow on a large scale has even wider implications than this. First, it has no doubt contributed to the general inflationary situation which is developing in the country as a whole. Of course the state is constrained by central government's monetary policy, and the fact that the money supply (M_3) nationally has risen by 17.3 per cent over the last year is not AP's fault.[39] Nevertheless there is a worrying trend here.

Secondly, such borrowing by the state must crowd out private borrowing and hence productive investment. Ultimately, whether through a rise in inflation or a fall in productive investment, it is the working people of AP and the "poorest of the poor" who will pay the price for this strategy. In the long run they may face lower real wages and fewer new jobs. In this sense the green card holders can eat cheaply now but will have to pay for it later.

Other States' Poor Suffer

To some extent the state government has played 'beggar-thy-neighbour' with the surrounding states. It did this by quietly reintroducing *de facto* zoning in 1983. At the time of implementing the Rs 2/kg scheme the state government revised the regulations regarding issue of permits to mills to sell rice. Each miller had to prove he had sold 50 per cent of his rice output to the FCI and 25 per cent to the APSCSC before he could receive a permit to sell the remainder.

Though in practice these proportions vary, the effect of the regulations was severe enough that the millers took the AP civil supplies department to court, claiming that it had no right to restrict the sale of rice in this way. The millers lost the case and the regulations are still in force.

To placate the millers (and satisfy central law, that is not purchase at the FCI price), the APSCSC paid a small premium over the FCI price—Rs 5 per quintal initially, Rs 22.7 per quintal in rabi 1984, and Rs 8-10 in recent years (Table 9).

After the FCI levy and civil supplies demand have been met, the miller can sell the remaining rice to any buyer, including out-of-state buyers, so that the policy certainly did not shut AP's borders to rice 'exports' on private account. And Andhra's net contribution to the central pool has not changed: some 5 to 6 lakh tonnes (0.5-0.6 mmt) of rice per year, which is partly offset by growing wheat supplies received through the FCI (Table 14).

But the permit regulations over the years 1983 to 1988 have nevertheless acted as a zoning policy limiting the total flow of rice from AP to other states. This inevitably results in other states' market rice prices being higher than they otherwise could have been, and the poor in other states thus pay a price for AP's rice scheme in spite of FCI's role as redistributor.

The evidence that AP 'exports' have been restricted is of two kinds. First, prices in nearby states have been consistently higher than in AP (though this could be explained by transport costs too). Radhakrishna and Indrakant found the premium for rice 'exports' out of AP was 12 per cent on average.[40] The retail coarse rice prices in different centres in the *Agricultural Prices in India 1982-85* series also support this claim.

In Bangalore and Madras many hotel meals include only limited rice, beyond which one must pay extra, whereas in AP cities unlimited rice is usually given. This suggests the higher cost and relative scarcity of rice in the neighbouring states.

Second, further evidence lies in the fact that in the financial year 1985-86, the vigilance cell of the AP civil supplies department achieved an all-time record in recovering smuggled goods. It has a network of 183 checkpoints (154 on the state borders and 29 on inter-district borders), where permits are checked against intended sale point. An amazing Rs 31 crore worth of goods were seized in one year, all illegally on their way out of the state. Among these goods were 18,000 tonnes of foodgrains (1.8 lakh quintals), 3,500 tonnes of groundnut seeds, and 27,000 tonnes of sugar.[41]

The rice caught on its way out indicate (a) that the net flow on private account i indeed to out-of-state buyers, suggesting tha any price rise in AP has not been far ou of line with rises in Bangalore or Madras and (b) that the flow was not allowed to full equilibrate demand and supply. The smug gling is therefore an indication that withir the AP market rice prices have been held down by the permit regulations, relative to no restriction on 'exports', while prices in neighbouring states have been higher than they could have been.

TDP claims proudly that "it is a matter of great satisfaction that nowhere in the country a 'food subsidy' scheme of this dimension, scope and coverage is implemented"[42] (see Table 1). Would the TDP leaders be just as proud to announce that their policies so far have made rice cheaper for Andhra Pradeshis but more expensive for Tamils, Keralites and Kannadigas?

Recently NTR proposed having the same rice ration scheme in the proposed national Federal Front manifesto.[43] Blinded by their success so far in electoral politicking, the TDP leaders may not have realised that a ration scheme on the scale of Andhra Pradesh's present one would be extremely costly for the nation as a whole. Although NTR "did not agree that developmental works became a casualty due to the populist scheme"[44], this is the obvious problem with such a huge subsidy scheme both at state and national levels.

Other indirect effects of the rice scheme lie in the areas of wages, relative prices and the cropping pattern. After

Table 11: Changes in Andhra Pradesh State Budget 1982-83 versus 1987-88

	1982-83 (Current Rs)	1982-83[a] (in 1987 Rs)	1987-88[b] (Current Rs)	Real Increase over Five Years (Per Cent)

(4) Balance = (1)−(2)−(3)	−53	−74	−583	789

Notes: a WPI rose from 288.7 to 401.7 giving a price of 39 per cent over 5 years.
b Revised Budget Estimates (RE)
c As the 1982-83 civil supplies subsidy figure was not available the 1983-84 figure has had to be used, thus understating the growth in civil supplies expenditure over the five-year period.

Source: *Andhra Pradesh Budget in Brief, 1988-89*, pp 1, 24, 40; price index from *Economic Survey 1987-88*.

living from April 1986 to June 1987 in a village in western Chittoor district, my impression was that wages in remote areas were at a subsistence level and the food subsidy actually kept them down. Agricultural workers in small hamlets got Rs 2.50 or Rs 3.00 for a full day's work (with meal) in most months, while workers in a central village of 300 houses got Rs 3.50 or Rs 4.00 per day. (The wages for Chittoor district reported in the most recent *Season and Crop Report* (1984-85) are far higher than this, being in the range Rs 5.50-6.00 depending on the month.)

Landlords and large farmers, knowing that the workers got the ration rice cheap, could push the cash wage even lower than usual. In addition they reduced the cash payment to pay for the workday meal. However state-wide wage data available do not support the hypothesis that the rice subsidy reduces cash wages generally (Figure 4). Wage rates rose substantially over the period 1981-82 to 1984-85 and no later data is yet available. This rise suggests that the statement that "over the long run, there is strong evidence that the real wages of agricultural workers have remained constant" is no longer true.[45]

A full analysis of the effect of Rs 2/kg rice on wages might well reveal different effects in deficit and surplus districts. The wage gap between the two areas is huge, even leaving out the fact that the statistics are biased upwards in backward areas by urban data collection. For instance, reported male field labour wages averaged Rs 10.26 per day across the state in 1984-85, but were Rs 11.78 (15 per cent higher) in the six coastal districts and only Rs 8.18 (20 per cent lower) in Rayalaseema.[46]

The scheme's effect on AP market prices is also debatable. I have argued that the permit regulations kept the rice prices lower than they could have been, but on the other hand Radhakrishna and Indrakant seem to conclude otherwise (p 76). No doubt the additional purchasing power in the hands of the rural poor, who have a high income elasticity of demand for food, has increased aggregate demand for rice relative to pre-1983 levels. It is hard to separate this effect on demand from the effects of zoning on supply.

The scheme has indirectly encouraged the production of cash crops on dryland. Unfortunately the extent of this change will be hard to measure, since the drought of recent years and the national scarcity of edible oils have also substantially affected cropping patterns in AP. Small dryland farmers have been induced to replace millets with groundnut through the increasing relative profitability of the latter. While groundnut prices rose over the period 1983-1987, ragi, bajra and jowar prices have stagnated[47] (see Table 15). In addition, as suggested earlier, demand for coarse grains has fallen in AP as poor households substitute cheap rice for millets. The size of this effect is suggested

by National Nutrition Monitoring Board data which estimated coarse grains in AP in 1980 to be 18 per cent of total grain consumption for the poorest, and a sharply lower percentage in higher income groups, falling to 5 per cent for the one-sixth of households in the highest income category.[48] A dietary shift toward rice and away from millets among the poor would explain the falling real millet prices and will also directly encourage the switch from coarse grains to groundnut production on their dryland.

The scheme affects the incentives faced by paddy growers too. Because the tax implicit in the low procurement prices is passed on to suppliers, farmers who sell to levied millers in areas where the procurement regulations are enforced are being discouraged from growing rice. In the meantime paddy farmers in non-levied areas—especially irrigated farmers in deficit districts—face higher market prices and are (relatively) encouraged to grow rice. Though this may have boosted this section of farmers' incomes, the cropping pattern that this price structure encourages may be inefficient.

Conclusions

To sum up, the rural and urban poor have gained some Rs 240 per year per household from the rice rationing policy, but it is a temporary, tenuous gain. The subsidy may later be cut as budgetary constraints begin to bite.

If the subsidy and ration are not reduced, the next crisis could come from the physical supply side. As the FCI buffer gets worn down and central government continues to pressure AP to donate its rice 'surplus' to central pool, another drought year, floods, or a concerted rebellion by the rice millers could lead to disaster. Empty, dormant FPS shops; a state government under attack from both voters and central government; soaring market prices as buyers turn to private traders and they throw their hands in the air saying, "civil supplies took all our stocks!"—this is the scenario if and when procurement is not sufficient to meet PDS demand in the state. At that point the "perverse and short-term logic" of state grain trading within a market economy would be obvious; Harriss's paradox could reappear in AP.

The rice rationing scheme helps people but it cannot be said to "eradicate poverty" since it does not tackle the basic structures which have created poverty. An electoral programme to solve the underlying problem must combine support for a targeted food subsidy with a set of demands for more fundamental changes.

Notes

12 'Sugar cards' entitle the holder to rations of sugar, kerosene, edible oil and occasionally wheat. 'Rice card' holders may buy all these commodities plus ration rice. Urban yellow card holders in three cities only (Hyderabad, Vijayawada and Vishakhapatnam) are eligible for up to 50 kg of rice per month at less subsidised prices (see text).

13 In the 1981 Census Andhra Pradesh is reported to have had 53,592,605 people in 10,895,760 households. Projecting these figures forward at the (compound) rate of 2.345 per cent per year calculated from AP's 1971-1981 population growth (1971 population 43,502,708), we get an estimate of 12.5 million households in July 1987. In Table 6 the figures for each agricultural year (e g, 1987-88) are given against the population at the start of that year (e g, July 1987). GOI *Census of India, 1981*, Series I: Household Tables (January 1988), Table HH-5.

14 See National Institute of Nutrition, (IMCR), Hyderabad, National Nutrition Monitoring Board Reports for the years 1980, 1981 and 1982. As more recent volumes of the NNMB's survey results come out we may get a clear picture of the impact of the Rs 2/kg scheme on AP diets. The consumption levels can be compared to earlier levels and to neighbouring states' levels. The latter comparison would to some extent offset the intervening effect of drought on diets.

Village data which I have gathered on a random sample of 90 households in western Chittoor districts in 1986-87 will, when fully analysed, indicate the role of Rs 2/kg rice. Besides the brief 'extended census' of 1,200 households covering nearly two villages, we carried out monthly interviews with 90 families over a period of 13 months. The resulting data cover grain consumption, purchases, stocks, and sales as well as harvests, wage labour, and family health. The problem with using such data in assessing the Rs 2/kg rice scheme is that the micro-survey lacks a pre-1983 'control' survey.

15 All-India public distribution of foodgrains over 1980-1983 averaged 1.75 kg per capita per month (including both recipients and non-recipients), compared with per capita net availability of 13.17 kg per month. In Andhra Pradesh per capita distribution in 1985 was 3.16 kg per month. Net availability unfortunately cannot be calculated at the state level because of private trade across state borders. See Table 4 and *Economic Survey 1984-85*, pp 106-07.

16 Compare K Subbarao's estimate of Rs 12.90 per month for 1985-86, calculated in a similar manner, in his *Interventions to Fill Nutritional Gaps at the Household Level: A Review of India's Experience*, Institute of Economic Growth, Delhi, October 1987, p 8.

22 The margins given to dealers are Rs 7.38 per quintal for rural shops and Rs 11.57 per quintal for urban shops. These margins are just a few paise per kg but they add up:

(i) Radhakrishna and Indrakant (1987) reported the following breakdown of cards: Urban 2.14 m green rice cards and 1.38 m yellow sugar cards; Rural 8.03 m green and 1.75 m yellow; Totally 10.17 m green and 3.13 m yellow cards for a grand total of 13.30 m cards. In the rural areas there were 9.78 m cards for 27,431 shops or 356 cards per shop in 1985. With 82 per cent of these cards green, that's an average of 292 green and 64 yellow cards. In the urban areas there were 3.52 m cards for 6,257 shops, of which 61 per cent are green, giving 343 green and 219 yellow cards per shop.

(ii) The average sales per card issued can be estimated as 2.1 mmt divided by 12 months and by 10.17 m rice cards. This estimate leaves another 2 lakh tonnes for distribution to yellow card holders in the three cities (1.2 lakh tonnes per year by APSCSC estimates) and to tribal areas and

special programmes. This method also precludes any error resulting from rations not being taken up. Thus the rice actually distributed per card (not eligibility per card) is 17.2 kg/card/month or 206.4 kg/card/year, on average.

(iii) The state provides rice at Rs 192.62 per quintal to rural dealers and at Rs 188.43 to urban dealers, and they sell at Rs 200 per quintal, so:

Rural gain = 206.4 kg × .0738 Rs/kg × 292 cards = Rs 4,447.83 per year per dealer.

Urban gain = 206.4kg × .1157Rs/kg × 343 cards = Rs 8,191.00 per year per dealer.

(iv) The subsidy involved for this group of 33,688 lucky shop owners is— again for ration rice alone—

Rural dealers subsidy = Rs 4,447.83 × 27,431 shops = Rs 12.2 crore.

Urban dealers subsidy = Rs 8,191.00 × 6257 shops = Rs 5.13 crore. In total that is whopping Rs 17.3 crore (173 million) a year.

(v) Note that the potential profits from selling even one bag of rice on the side are large in relation to the monthly dealer's margin. Rice not sold at Rs 2/Kg, can be sold for Rs 3.00, 3.25 or even Rs 3.50 by 'entrepreneurial' dealers. Their margin on these illicit sales are not Rs 8 per bag but Rs 108 per bag or more, the entire amount up to the going market price going into the dealer's pocket. As the ration price gets further out of line with the market price of rice the temptation and potential profit get larger.

23 *A Synoptic Note on the Public Distribution System in Andhra Pradesh*, presented to union minister for civil supplies by chief minister of Andhra Pradesh, Hyderabad, September 18, 1987, p 27.

24 Ibid, calculating the rural all-inclusive dealers subsidy = Rs 9,000 × 27,431 shops = Rs 24.69 crore and urban all-inclusive dealers subsidy = Rs 23,400 × 6,257 shops = Rs 14.64 crore per year. Total is Rs 39.33 crore. The Vijayawada study (op cit, note 13) described how "all the dealers are unanimous in expressing satisfaction at the working of the scheme" (p 11).

25 Radhakrishna and Indrakant, p 50.

26 Ibid, pp 47-48, report this as a profit margin of 22 per cent since the average price received per quintal of rice was Rs 291 (65/291 = 22 per cent). It would be interesting to know the profit per unit of capital stock.

47 The wholesale price of groundnut in Hyderabad rose from Rs 339 per quintal (pods) in 1981 to Rs 651 per quintal in 1985 (*Agricultural Prices in India, 1982-85*, p 155) and the all-India wholesale price index for groundnuts rose from 242 in 1981-82 to 295 in 1984-85 and 348 in 1986-87—a 44 per cent rise over five years (*Economic Survey 1987-88*, p S-59; index base year 1970-71 = 100). By way of contrast wholesale coarse grain prices rose less, on average by only 8 per cent over four years (prices for particular markets from *Agricultural Prices in India 1982-85*, pp 32, 64, 40, 44). In other words coarse grains prices have fallen in real terms. See Table 15.

48 The figures are given in grams per day for four categories: (1) Hhs earnings 0-1 Rupee/day (17 per cent hhs) ate 82 per cent rice and 18 per cent coarse grains; (2) hhs earning Rs 1-2/day (67 per cent) ate 89 per cent rice, 10 per cent coarse grains and 1 per cent wheat; (3) hhs earning Rs 2-5/day ate in the same proportions as those in class (2); and (4) hhs earnings over 5 Rs/day ate 93 per cent rice, 5 per cent coarse grains and 2 per cent wheat. NNMB Report for the year 1980 (op cit, note 14), p 73.

FACOR

NOTICE

1. It is hereby notified for the information of the public that Ferro Alloys Corporation Limited (FACOR) proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of Section 23 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the take over of the whole or part of Vidarbha Iron & Steel Corporation Limited (VISCO).

Brief particulars of the proposal are as under:-

i)	Name and address of the applicant	: FERRO ALLOYS CORPORATION LIMITED Shreeram Bhavan Tumsar-441 912 (Maharashtra)
ii)	Name & address of the undertaking, the whole or part of which is proposed to be taken over and the manner of take over i.e. by acquisition of shares, acquisition of control or management, whether by the acquisition of the ownership of the undertaking or under any mortgage lease or licence or under any agreement or other arrangement.	: VIDARBHA IRON & STEEL CORPN LIMITED Shreeram Bhavan Ramdaspeth Nagpur By taking the mini steel plant installed by VISCO in MIDC Industrial Area, Nagpur together with buildings, other equipments and installations on Leave and Licence basis.
iii)	Management structure of the applicant	: FACOR is managed by its Chairman and Managing Director, Vice-Chairman & Jt. Managing Director and two wholetime Executive Directors under the supervision, direction and control of the Board of Directors consisting of:-

Mr. Umashankar Agrawal	Chairman and Mg. Director
Mr. R. K. Saraf	Vice-Chairman & Jt. Managing Director
Mr. Chandrakant Mor	Executive Director
Mr. Manoj Saraf	Executive Director
Mr. Jayant Dalal	Director
Mr. E. B. Desai	Director
Dr. N. Bhagwandas	Director
Mr. Shravankumar	Director
Mr. K. Srinivasamurthy	Director
Mr. Govinddas Agrawal	Director
Mr. Jamnadhar Mor	Director
Mr. M. B. Thaker	Director

As on 31.3.1989

iv)	Capital Structure of a) the applicant b) the undertaking proposed to be taken over	: Capital Structure of FACOR Authorised Capital: Rs. 1000 lacs. Issued, Subscribed and Paid-up Capital: Rs. 552.26 lacs. Capital Structure of VISCO Authorised Capital: Rs. 250 lacs Issued Capital: Rs. 50 lacs Paid-up Capital: Rs. 48.66 lacs.
v)	Line(s) of business of the undertaking which will or is likely to emerge as a result of the proposed take over	: FACOR is at present engaged in the business of manufacture and sale of various kinds of Ferro Alloys, Charge Chrome and mining mineral ores. With the proposed take-over of VISCO's mini steel plant, it will also be engaged in the manufacture and sale of Steel Ingots/Cast Billets, Light Structurals, Flats and Bars.
vi)	Consideration for the take over	: FACOR will pay to VISCO by way of compensation for use of their plant; machinery, equipments etc. Rs. 4 lacs per month plus 1/3rd of the net profits made by FACOR on the operation of the plant.
vii)	Scheme of finance indicating the source(s) of finance for the proposed take over.	: No scheme of finance is involved and amount of compensation will be paid by FACOR out of its own operations.

2. Any person interested in the matter may make a representation to Secretary, Department of Company Affairs, Govt. of India, Shastri Bhavan, Dr. Rajendra Prasad Road, New Delhi, within 14 days from the date of publication of this notice intimating his views on the proposal and indicating the nature of his interest therein.

Offshore Financial Centre

Far-reaching changes have taken place in the international financial markets in the 1980s. The external financial position of India too has altered markedly. Have the recent international financial market developments made it more opportune for India to establish an offshore financial centre? And has the cost-benefit of such a centre become more favourable today than it was in the early 1980s? **1653**

Panchayati Raj

It is true that the panchayati raj system has not been working well in large parts of the country and there is need to revitalise it. However, the Constitution (64th Amendment) Bill can be said to be at best a partial effort in that direction. A study of the experience of panchayati raj in different states. **1663**

Blind Spot

The government consists of class enemies, but the external policy of class enemies, through some sleight of hand, gains acceptance as a correct policy for the Left to follow, even if it means support to imperialist, and sometimes even fascist, causes. **1623**

Test Case

Among recent developments on the working class front, the lock-out at the Bombay factory of Hindustan Lever was undoubtedly a major one. Apart from the fact that it stretched for a full year and involved 3,000 workers and one of the largest multinational companies in the country, the real significance of the lock-out lay in the fact that in it were crystallised some of the central issues confronting the trade union movement in India today. **1627**

Feminism and Socialism

The relationship between feminism and socialism is an old one, but its modalities are not defined on either side and there is very little open debate. What we do have instead are hardline attitudes and reactions and counter-reactions. **1639**

Doctors and Torture

Health professionals are often involved in cases of torture and use of third-degree methods by the state. By participating in such acts they grossly violate a number of national and international codes of ethics. How can the abuse of human rights by health professionals be prevented? Equally importantly, how can doctors be protected against being coerced by the state to take part in torture? Report on an Amnesty International seminar. **1633**

We are now used to harrowing tales of torture and faked encounters in Punjab, but the national press has been remiss in not reporting police atrocities in Jammu and Kashmir. **1626**

Income and Consumption

Variations in expenditure on consumption items cannot always be explained in terms of differences in income. It is possible to demarcate some income ranges within which the level of consumption expenditure on many items is insensitive to variations in income. Results of a study of West Bengal state government employees in Calcutta. **1669**

Double-Faced

The current controversy over the revision of electoral rolls in Assam shows, once again, how there is no limit to the cynicism of the Congress(I) which is attempting to appease Assamese sentiments in the Brahmaputra valley and simultaneously stoke the fears of the so-called 'illegal foreigners' in the state. **1631**

At Home and Abroad

If the American people were part of the Pakistani electorate, Benazir Bhutto could have become prime minister of Pakistan for life. But successful foreign tours rarely help to avoid dealing with real problems at home. The day Benazir Bhutto left on her US trip, the opposition parties in Pakistan at last got their act together and formed a Combined Opposition Parties group to confront the government. **1638**

Unfulfilled Commitments

The government cannot claim to have acquitted itself creditably in dealing with the issues arising out of the record oilseeds production in 1988-89. It has failed to fulfil its commitments in regard to the two crucial elements in its integrated edible oils policy: building a buffer stock of 5 lakh tonnes of oil and maintaining the prices of the major oils within a pre-specified price-band. **1618**

LETTER TO EDITOR

Reporting Bhopal

I WISH to respond to Padma Prakash's review on my book, *Bhopal: The Lessons of a Tragedy* (December 3, 1988).

The only nice thing that Padma Prakash has to say about my book is in her last sentence and I quote: "And, unfortunately, of all the books on Bhopal, many of them more analytical, this will be the one which will probably be read most widely." However, unlike Padma Prakash, I see nothing unfortunate in people reading my book.

Padma Prakash accuses me at various points of sanitising the horror of the disaster and of falling prey to a UCC disinformation campaign. Of course, she is nice enough to say that I try and document Bhopal "objectively". But she doubts whether this "much-touted principle of good journalism" can apply to such a situation. She also says that my view of the medical tragedy is that UCC failed to give proper information instead of trying to cover up. But the nastiest bit is about how the book is "something of a betrayal of the thousands who died and the generations who continue to suffer from the Union Carbide disaster". She also questions my data base, saying I rely excessively on the *New York Times*, the *Washington Post* and the *International Herald Tribune*.

Let me deal with these points.

On sanitising the tragedy: Padma Prakash contradicts herself in the very next sentence saying, "It is certainly not an unfeeling narration—far from it." Falling prey to a UCC disinformation campaign: that is questioning the professionalism of a reporter who's been in the line for 15 years and I dislike the insinuation. I detect that Padma Prakash's annoyance flows from my reference to UCC's sabotage theory in four and a half pages (including the major flaws in that theory) out of a total of 230 pages. Quite frankly, I do not see how anyone can afford to write a book about a major disaster and not look at all aspects of it. And UCC's sabotage theory has been whispered about but never discussed openly, as if it were some evil thing that will envelop us in its embrace. One must tackle such issues head-on instead of running away from a discussion. And, obviously, discussion does not mean acceptance of a viewpoint.

This is scarcely the place for a debate on what makes good journalism. Or what doesn't. But since Padma Prakash mentions it, let me say that dodging issues is not a barometer of good journalism or honest criticism eit' er.

On the medical tragedy and UCC's failure: I think that Padma Prakash should read that part of the book which deals with the UCC's medical response a bit more carefully. I say quite clearly there that the doctor at the Bhopal plant recommended using a wet cloth only although he knew "as did other key Carbide personnel who had read the company manual on MIC, that the chemical was deadly. . . was both toxic and flammable and overexposure could lead to fatal pulomonary oedema". Then I describe how the Carbide medical director in the United States sent off a telegram that said that "if sodium cynide poisoning is suspected, use Amyl Nitrate. If no effect, sodium nitrite 0.3 gms and sodium thiosulphate 12.5 gms". And sodium thiosulphate, as Dr Hireesh Chandra, the forensic expert at the Hamidia Hospital, pointed out and which is reflected in the book is the recognised antidote to cyanide poisoning. I think it is a gratuitous insult to readers that they should be told at every page that there is a cover-up. It has been my experience that we often underestimate our readers and they can easily follow complex issues when laid out clearly. Carbide's dishonesty is clearly shown in a series of incidents.

On the activists: they won one major battle in getting the sodium thiosulphate theory accepted and have, especially in the past months since the Supreme Court judgment, kept the issue alive through rallies, demonstrations and their work. I speak of the way the government disrupted their work. No one is seeking to undercut their struggle. But the tragedy of the activist movement in Bhopal is that it is splintered, divided by ideological differences and personal disputes. That is why it has not had the impact that it should and could have had on the country. Take just one example: how does one explain the lack of response or the failure to create a Special Bhopal Fund in nearly five years despite the public interest? Such a fund could have given some sustenance to the most wretched of the victims, at the least. I don't think that there are any sacred cows which must go unchallenged.

On the data base: of 377 references to sources, etc, 20 are to the *New York Times* (no, I did not quote my own reports as you presumed, Padma Prakash), a major portion of which are reports which appeared about the complex litigation in the United States and about Union Carbide operations there, not here, their violations of safety norms, etc. There are two references to the *International Herald Tribune*, one to the *Washington Post*, one to *Newsday* and another to the *Asian Wall Street Journal*. I personally conducted more than 250 interviews for the book—well, I guess that doesn't really qualify for a data base in Padma Prakash's perception. After all, I'm a prejudiced, "thick-skinned objective reporter". If it is Padma Prakash's point that I haven't read the national press on the issue, then I must hasten to correct that impression.

I think that her remark about betrayal reflects a viewpoint that is prejudiced: basically, this says my view right or wrong, and is intolerant of others. The book seeks to rouse public awareness to the dangers from haphazard industrialisation and misplanned development and the unscrupulous interests (including multinationals) that promote these pressures. Bhopal may have happened in 1984. But it's there all around us, lurking and waiting to strike. Are we any more ready than we were five years ago? I think not. And if Padma Prakash were able to turn her ideas and energies to that as much as to the present (and the past) then she would understand what I've been trying to say.

SANJOY HAZARIKA

New Delhi

ECONOMIC AND POLITICAL WEEKLY

Bofors Again

THE ghost of Bofors, which the Congress(I) had thought it had laid to rest with the highly contrived report of the so-called Joint Parliamentary Committee (JPC), has returned to haunt the ruling party. The report of the Comptroller and Auditor General (CAG), which the government at last presented to parliament this week after dilly-dallying for three months, contains no startling new disclosures. It was not, in any case, expected to throw any light on the one vital aspect of the Bofors deal which still remains to be ferreted out—the identity of the ultimate Indian beneficiary(ies) of the huge commission or bribe or whatever one chooses to call it that Bofors, it is now abundantly clear, paid to clinch the 155 mm field-gun deal. All the same, the vicious reaction of Congress(I) spokesmen, such as that of the party's deputy leader in the Rajya Sabha, N K P Salve, makes it clear that the party leadership has been touched to the quick by the CAG's report.

As the fact of underhand payments having been made has become increasingly difficult to deny in the face of evidence that has been unearthed despite the government's best efforts to suppress it, the Congress leadership has taken its stand on the argument that, be that as it may, the decision to go in for the Bofors gun was nevertheless correct and that the objective of equipping the army with the best armaments, from among the choices available, had not been compromised in any way. What the CAG's report has now done is to question this presumption. It has found that the procedures followed for evaluating the different offers and for field-testing the competing equipment had left a great deal to be desired. It has also drawn pointed attention to the fact, already known, that all along, at different stages, the army establishment's preference had been for the French gun, Sofma, with the Bofors gun figuring as the second choice till February 1986 when suddenly the army headquarters reversed its preferences and the contract with Bofors was signed the next month. The JPC had recorded at some length the then army chief General Sundarji's explanation for the change, but the CAG is sceptical about the reason advanced, pointing out that the intelligence about the supply of a certain type of radar by the US to Pakistan, which according to Sundarji had overnight tilted his preference in favour of the Bofors gun, had in fact been available for quite some time. The CAG's report also refers to the minimum acceptable standards for ammunition being diluted to accommodate Bofors. On the subject of agents and commission the report draws attention to the fact that while the French firm manufacturing the rival gun had written to the government confirming that it had dispensed with the services of its Indian agent, the government had not sought and secured any such undertaking from Bofors in spite of the fact that the Indian high commission in London had informed the defence ministry that Bofors indeed had an Indian agent.

What is as much, if not more, damaging to the government in the CAG's report are the clear indications it contains of efforts on the part of the government to keep back information from the CAG, indeed of veiled suggestions that since the Bofors guns purchase was being enquired into by the Joint Parliamentary Committee the CAG need not go into the matter at all and should consider his job done with assisting the JPC, provoking the CAG to write to the defence secretary in August 1987 thus: "I need hardly emphasise that this [assisting the JPC] does not circumscribe our authority to go into this or any other connected transactions in the usual manner separately or later on, if considered necessary." A number of specific instances quoted by the CAG make it clear that the government throughout behaved as if it had much to conceal which it would rather the CAG did not go into.

Having avoided making public the CAG's report for as long as possible, the Congress(I) is now all for a debate in parliament on it. Indeed a great deal of populist self-righteousness is being vented against the Comptroller and Auditor General—a mere bureaucrat ("that Charlie", as the deputy leader of the Congress Party in the Rajya Sabha put it) who has dared to contradict the conclusions arrived at by the elected representatives of the people as expressed in the report of the Joint Parliamentary Committee. The fact is that the leadership of the ruling party is once again seeking, as it did earlier through the JPC, to use democratic institutions and processes to shield its wrong-doings. This it is able to do time and again thanks to its huge parliamentary majority and thanks to the manner in which all Congress(I) functionaries, including the party MPs, have been reduced to the position of loyal courtiers and retainers of the prime minister. The whole episode thus also serves to underscore what is happening more generally to the political system itself—the progressive infusion of authoritarian content into the formally democratic shell.

INDIA AND SRI LANKA

Dangerous Direction

NONE of the thirty heads of government he met in Paris nor Soviet president Gorbachev seemed to be worried about Sri Lanka and "nobody asked us a question about it", says our prime minister in the course of his press conference at the airport on his return from the trip that carried him to three capitals, Paris, Moscow and Islamabad. This observation was made by the prime minister towards the end of his severely critical, indeed belligerent, remarks castigating Sri Lanka for the "sloppy" manner in which it was conducting relations with India on the matter of the IPKF's withdrawal from its territory and sounding a warning that the situation in Sri Lanka was taking "dangerous directions" with the government there backtracking "on contractual obligations to devolve power to Sri Lankan Tamils".

Whether or not Premadasa is being "sloppy" in having made his correspondence with Rajiv Gandhi public, it is a grave matter when the latter speaks of a "dangerous situation" and that too when in the same breath he asserts that no other country is worried what happens in Sri Lanka.

Rajiv Gandhi is rattled that Premadasa is not responding to the Indian invitation to sit together to work out a time-table for the withdrawal of Indian troops. Instead, he continues to insist that the date he had set for withdrawal, namely, July 29, must be observed. India refuses to commit itself on a date for the withdrawal of the IPKF on the ground that sufficient devolution of powers to the provincial government of the north-eastern region has not yet taken place, a position that Premadasa simply does not accept. Sri Lanka takes the clear stand that under the India-Sri Lanka accord the Indian troops went to Sri Lanka at the request of its president and were obliged to withdraw when requested by him and that the president's authority to ask for the withdrawal of the Indian troops was not in anyway tied to the pace of devolution and certainly not subject to the view India would take on whether or not devolution was taking place at the right pace. The latter would virtually subject the Sri Lanka president's power to an Indian veto. The Sri Lankan government's commitments with regard to the devolution of powers to provinces, and in particular to the north-eastern province, according to this view, stand on their own. Rajiv Gandhi, on the other hand, takes the view that India is the guarantor of the devolution of power to the Tamils. Although he doesn't quite say so, it is clear that he would link the withdrawal of Indian troops to the progress in devolution and that too to the Tamils of his choice, namely, Varadaraja Perumal and company who came to power in the so-called free elections from which 90 per cent of the electorate stayed away.

Whether or not the Indian troops stay on in Sri Lanka beyond July 29, the possibility of the current dispute taking "dangerous directions" has got to be averted. The fond belief that the rest of the world will not lose sleep over what happens in Sri Lanka is pure and simple delusion which Rajiv Gandhi should get over the soonest. The temptation to do something hasty must be resisted. Sri Lankan Tamils may still want and may fight for an independent Eelam, but not for a phony one ruled over by Indian stooges.

POLITICS

Exporting Congress Culture

IF the west is accused of 'cultural imperialism', we also have our own brand of 'cultural imperialism'. It is no longer confined to the commercial endeavours of flooding south-east Asian countries and certain parts of Africa with the tawdry Bombay films. The culture of the Congress(I) is now being inflicted upon other parts of the world, in all its pugnacious and lecherous forms.

At the recently concluded International Youth Festival in Pyongyang in North Korea, the Youth Congress(I) and NSU(I) delegates—who naturally formed the bulk of the Indian delegation—gave a performance which could be described as a fitting representation of the culture of the ruling party. Their passion for projecting the culture took various forms ranging from attempts to molest women delegates from other countries and public drunken brawls to physical assaults on women members of their own team. Taruna Gurjar, a joint-secretary of the Youth Congress(I), who was a part of the team, has submitted a written complaint to the prime minister alleging that another joint-secretary of the organisation beat her up. When she sought help from Mukul Wasnik, the president of her organisation, who was also a delegate at the festival, he was reported to have advised her to keep silent as it was a "family matter". Margaret Alva, the union minister of state for youth affairs, who was also in Pyongyang at that time, and was informed of the incident, chose to remain silent. According to Indian delegates who have returned from the festival, the Youth Congress(I) and NSU(I) hoodlums had earned such notoriety for their behaviour that participants from other countries shunned them all through the festival—an international testimony to the Congress(I) culture!

But whatever the Congress(I) high command chooses to do about the Pyongyang scandal—if anything at all—there are several interesting and intriguing questions about the whole affair. First, the Youth Congress(I) and NSU(I) for several years now had earned a notoriety for its behaviour. In 1984, during a conference in Nagpur, the young Congress(I) ruffians went berserk and set a record of sorts which is still remembered by the people there. The scenes of rowdyism which marked their canvassing for the coveted delegates' tickets to the Youth Festival in Delhi prior to their departure, should have been taken as a warning about what was to happen in Pyongyang. For several days, members of the Youth Congress(I) and NSU(I) fought among themselves for air-tickets, mobbed their leaders, making a nuisance of themselves in the streets of Delhi.

What is surprising is that the Congress(I) high command seems to show some discerning instinct in choosing delegates for the India festival held in western countries. They may be favourites of some bureaucrats in the ministries, but at least the latter ensure that they do not go around chasing women and getting involved in drunken brawls in the western capitals. But when it comes to selecting delegates to Moscow-sponsored festivals like the Youth Festival, New Delhi leaves it to the local bosses of the Congress(I) organisations. Incidentally, this is not the first time that Congress(I) youth delegates have behaved in an obnoxious way at international conferences. Earlier, at a youth conference in Moscow they posed a menace to women delegates there. The Moscow-based youth organisations appear to take such things lightly. In spite of a series of incidents of misbehaviour by Congress(I) youth hoodlums, they are not reported to have taken up the issue with the Indian government. Is it because of the policy to woo India as a so-called 'non-aligned' ally?

There is a footnote to the Pyongyang incident. The Youth Congress(I) president Mukul Wasnik issued a statement on July 13, in his capacity as chairman of the national preparatory committee for the Pyongyang Youth Festival, stating that "some incidents have been blown out of proportion, while certain totally baseless stories have also appeared in a section of the press"—thus trying to whitewash his cohorts. Curiously enough, the co-signatories to the statement by Wasnik were M A Baby, a CPI(M) MP and D Raja of the CPI, both co-ordinating secretaries of the national preparatory committee. One wonders whether the Indian communist support to 'non-alignment' also embraces the moral values of the Congress(I) culture!

ASSAM

Repeated Folly

WITH the promulgation on July 6 of the Assam Disturbed Areas Act, 1955 and of the Armed Forces (Special Powers) Act, 1958 as

amended (in 1972) on July 12 by the government of Assam in Kokrajhar district, the prospects of a political settlement of the 'Bodoland' demand appears bleaker than ever before. The promulgation of these acts also suggests that at least for the present the government has decided that there is no use seeking a dialogue with the leaders of the agitation and that more administrative action may yield results.

The notification under the Assam Disturbed Areas Act, 1955 is to remain valid for six months while that under the Armed Forces (Special Powers) Act, 1958 is to remain valid for three months. Both the notifications are presently applicable only to Kokrajhar district though other parts of Assam, especially the Udalguri sub-division of Darrang district and parts of Barpeta and Nalbari districts, have also been wracked by violence in connection with the agitation by the All Bodo Students Union headed by Upendranath Brahma (ABSU-UB) for the creation of a separate 'Bodoland' with additional safeguards for the plains tribals in the southern bank of the Brahmaputra and in the Karbi Anglong autonomous district.

It is true that there has been considerable violence in connection with the 'Bodoland' agitation but the kind of problems that have given rise to the present situation in Assam have never been solved by taking recourse to these laws—a point that hardly needs to be made in the context of Assam and indeed of the region. On the contrary, the use of the special and indeed extraordinary powers available under these two acts may well become an end in itself, as has been the case in Manipur where the Armed Forces (Special Powers) Act has become a permanent feature. The abuses that these acts give rise to are now a matter of wide knowledge.

The irony of the present situation in Assam is that the leaders of the Asom Gana Parishad (AGP) had themselves severely condemned the use of these very laws during the height of the Assam agitation, as leaders of the All Assam Students Union (AASU), and had accused the security forces of indulging in atrocities in the wake of the notifications under these acts in North Kamrup area in early 1980. There is no reason to believe that the wide and untrammelled powers under these acts will not once again be misused by the security forces in Kokrajhar area where already the state police functioning under normal laws has been accused of indulging in atrocities.

For, given the reality in India, any police-force even under the strictest control needs watching since it already has extraordinary powers. Moreover in Assam, already the state government has armed itself with special powers under the Terrorist and Disruptive Activities (Prevention) Act and hundreds of activists of the ABSU-UB have been held without trial. The intensity of the attacks on the police forces (16 police personnel were killed in the just concluded 340-hour bandh) only reflects the hatred that the police forces have already earned in the Bodo-dominated areas. With these additional powers (and the immunity against any action even if these powers are misused), such depredations will only increase, further intensifying the divide not merely between the police and security forces and the Bodo masses but also between the state government and a section of the people who the AGP leaders still claim (and probably also sincerely believe) are an inalienable part of the 'greater Assamese society'.

The most self-defeating aspect of these promulgations is that the AGP government seems to have given up, at least for the present, all attempts to deal with what is admittedly a very grave problem in a political manner. The oft-repeated statements by the AGP leaders, including chief minister Prafulla Kumar Mahanta, that the demands of the ABSU-UB are basically political now appear mere statements meant for record; the situation, the AGP leaders appear to believe, admits only an administrative approach. Such surrender of a political initiative on the part of a party whose very existence is deeply rooted in an agitation first perceived to be merely a law and order problem but later acknowledged to be political shows how far the AGP has travelled from its roots in barely three and a half years of political office. The tragedy is that just as the adversaries of the present AGP leaders learnt that mere counter-violence could not break the back of the Assam agitation, the AGP leaders too will have to learn their lesson in turn. But the costs of such repeated folly, already very high in Assam, is going to be even more prohibitive.

SOVIET UNION

Coping with Inflation

ABEL AGANBEGYAN, the Soviet economist supposed to be leading the think-tank for Gorbachev spoke sometime back about making the rouble convertible, though not immediately. Now, another Soviet economist has appeared in the firmament of perestroika. He is Nikolai Shmelyov who accompanied Gorbachev to Paris, a visit Gorbachev would not postpone for the sake of Gromyko's funeral.

Like Aganbegyan, Shmelyov too speaks of establishing the market "as a matter of survival for us", but he realises that prices cannot be suddenly freed. So he calls for putting together some $ 30 billion "to import consumer goods over the next two or three years" while more far-reaching reforms have a chance to take effect. This in itself is important for Indian policy-makers to note because with timely and appropriat steps it should be possible to meet part o this additional Soviet demand, particularl if they are going to pay for it in convertibl currency. But there is much more to it.

Shmelyov suggests raising the abov money principally by borrowing against gol reserves, but he also recommends stoppin projects requiring costly imports, a cut-bac in the Soviet Union's international obligations such as subsidies to Cuba, and resor to normal commercial bank loans.

Not only would Shmelyov import consumer goods in sizeable quantities and flood the Soviet market but he would also take special measures to revive Soviet agriculture so that Soviet imports of agricultural products, especially foodgrains, can be reduced, if not altogether eliminated. Shmelyov recommends paying the Soviet farmers hard currency to spend as they choose for the surplus output they market and figures that by taking just this single measure it should be possible for the Soviet Union to save as much as $ 5 to 6 billion on food imports annually. As he puts it, "more Soviet-grown grains is lost now than imported, 15 per cent of meat produced is wasted, 60 per cent of fruits and vegetables".

Shmelyov's programme for the revival of Soviet agriculture goes further. He would (1) give land to anyone wanting to farm—no ceiling is mentioned; (2) stop obligatory deliveries; (3) free most agricultural administrators; and (4) reduce the gap between the prices farmers get and the prices they pay for supplies.

Basically, as Shmelyov sees it, the Soviet economic problem, in the short run at least, is that of inflation, already running at 10-11 per cent per annum but threatening to go out of control, and this he attributes primarily to large budget deficits. Shmelyov's biggest short-term worry is some $ 225 billion in "loose roubles" which he hopes to mop up with the help of imports "as cheaply as possible". Every dollar's worth of goods would fetch 8 to 10 roubles at home and goods like personal computers would bring in 25 roubles for every dollar. Without mopping up these loose dollars, there could be astronomic inflation.

Shmelyov does not speak of aiming at the convertibility of the rouble. He evidently figures that only if the danger of domestic inflation is averted fully, even though it means raising sizeable funds abroad, will there be any chance for the Soviet economy to be stabilised. And only if first the economy is stabilised and freed from the threat of runaway inflation can the economic reform envisaged by Gorbachev's perestroika have a chance to take root. So the matter of convertibility of the rouble is likely to remain on the back-burner for quite some time.

VEGETABLE OILS

Government Fails to Fulfil Commitments

SELDOM before has the vegetable oils scenario been so very reassuring as it is this time. Despite the drastic cut in edible oil imports from a record 18.4 lakh tonnes during the 1987-88 oil year (November-October) to an estimated 4.5 lakh tonnes in 1988-89, the prices of vegetable oils—edible as well as non-edible—are ruling well below those a year ago. Linseed oil is cheaper by 28 per cent, edible grade rice bran oil by 21.7 per cent, mahuva oil by 16.8 per cent, castor oil by 14.8 per cent, inedible rice bran oil by 13.9 per cent, refined rape/mustard oil by 13.5 per cent, cottonseed oil by 8.2 per cent, groundnut oil by 7 per cent and refined soybean oil by 4.5 per cent. Only sesame oil is quoted at around its previous year's level.

The decline in vegetable oil prices appears all the more significant when seen in the context of the rise in the official wholesale price index—the 'all commodities' index being about 8.5 per cent up over the year. Among the various major commodities comprising the index, only oilseeds and edible oils are down over the year—by 20.5 per cent and 4.3 per cent respectively. Quite apparently, the cutback in edible oil imports has been more than offset by the impressive increase in indigenous supply. Oilseeds production this season is now generally reckoned at 165 lakh tonnes against 123.8 lakh tonnes in 1987-88—up 33.3 per cent. This is the biggest-ever increase in any single year.

Nobody really apprehends any shortage of vegetable oils during the traditional lean period (August-September) which could cause a worrisome rise in prices. In fact, for the first time in several years the current season is expected to end with a reasonably satisfactory carryover stock of seeds/oils.

Market psychology has been influenced in no small measure by the promising kharif crop prospects. Based on forecasts of a normal monsoon and good-to-ideal weather condition so far in the major kharif oilseed growing states of Gujarat, Andhra Pradesh, Karnataka and Madhya Pradesh, groundnut and soybean production could well surpass the 1988-89 record output of over 88 lakh tonnes. By the end of the first week of July, 32 out of the 35 meteorological sub-divisions were reported to have received excess or normal rainfall. According to knowledgeable persons in the oilseed trade, weather conditions this year so far have been more favourable than last year. Production prospects have also improved because the government has considerably strengthened its machinery for the timely supply of crucial farm inputs.

If oilseeds production turns out to be appreciably higher than in 1988-89, the government will have to think very seriously of evolving an appropriate strategy to deal effectively with the emerging situation. This will not only call for hard decisions covering diverse issues relating to prices, procurement, buffer stock and storage facilities, finance, imports and exports, but also bold steps to implement these decisions.

One hopes the government has learnt a good lesson from its acts of omission and commission during the current season. New Delhi cannot claim to have acquitted itself well in dealing with the issues arising from the record oilseeds production in 1988-89. It has failed to fulfil its commitments in regard to the two crucial elements in its integrated policy—buffer stock of 5 lakh tonnes of oil and the price band of Rs 20,000/Rs 25,000 per tonne in respect of groundnut oil as well as rape/mustard oil. The price of groundnut oil moved above the lower limit of the price band only after the bulk of the kharif crop had already been marketed. Mustard oil is still quoted Rs 2,000 to Rs 2,500 a tonne below the revised lower limit of Rs 17,000 announced at the end of June. And total procurement by NDDB and the state-level agencies is estimated at 2.25 lakh tonnes in terms of oil which is substantially below the buffer stock target (inclusive of imported oil).

Apparently, while formulating its integrated policy for oilseeds/oils, the government had not envisaged the kind of increase in oilseeds production that came about—by over 40 lakh tonnes in a single season—which reflects poorly on the official crop information system. The government could not therefore assess properly the likely impact of increased supply on prices as also the magnitude of procurement effort needed to implement the price band.

It is not merely that the government could not arrange procurement operations on a requisite scale to effectively operate the price band. If the government were earnest about the minimum price and it found that it did not have adequate infrastructural facilities and organisational capabilities to perform the task it could have easily sought the co-operation of the private trade to build large inventories in order to absorb excess supply by relaxing the stock limits under the storage control order supported by credit facilities. This it did not do.

In view of the continuing pressure of mustard oil supply, which is amply borne out by oil prices keeping substantially below the revised stipulated minimum of Rs 17,000 a tonne, causing considerable embarrassment to the government and the procurement agencies there seems little sense in imposing any restriction on the use of this oil by the vanaspati industry. Why the government should have persisted with the curb—restricting the usage to 20 per cent of the industry's total oil requirements—is hard to appreciate.

Worst still is the government's decision to import one lakh tonnes of palmolein to meet PDS requirements. Import of palmolein is said to have been necessitated by the "sharp rise in groundnut oil prices". But this hardly makes sense. How can the government feel concerned about the price rise when groundnut oil prices are still well below the upper limit of the price band of Rs 25,000 a tonne?

The emerging edible oils scenario and the implementation of the integrated policy for oils have brought into sharp focus certain conceptual weaknesses in the policy (fixing a common price band for groundnut oil and mustard oil which have their own demand-supply equations because of marked consumer preferences is a good illustration of this) and infrastructural and organisational inadequacies for undertaking procurement on the desired scale.

Despite reassuring new crop prospects it would perhaps be too optimistic to expect oilseeds production to touch the Seventh Plan target of 180 lakh tonnes set for 1989-90. It would therefore be unfortunate if a further increase in production next season were to be allowed to develop into a 'crisis of plenty' pushing prices down to levels which adversely affect farmers' intentions to cultivate oilseeds. This would also be politically inexpedient in an election year.

While one cannot be too sure about oilseeds production in 1989-90, the government will need to keep ready with various policy options to deal effectively with the emerging situation. It will have to make up its mind on the pricing policy it wishes to pursue, measures which will be required to be taken to implement the pricing policy, strengthen the procurement machinery and creation of adequate storage facilities. Improved supply should provide a good opportunity to further reduce edible oil imports and step up exports.

INDUSTRIAL FINANCE

Free Flow

OVER the 25 years of its existence, the Industrial Development Bank of India (IDBI) has played a laudable role in the industrial development of the country. During the nine-month period, July 1988 to March 1989, overall sanctions and disbursements of the bank under various schemes of assistance aggregated Rs 4,746.5 crore and Rs 3,381 crore, recording a growth of 46 per cent and 27.3 per cent, respectively, over the previous corresponding period. Growth in sanctions during this period under the direct finance, refinance and bills financing schemes was 80.7 per cent, 30.6 per cent and 22.5 per cent respectively. The total assistance outstanding at the end of March 1989 was Rs 15,643.9 crore.

Industries which were sanctioned significantly higher amounts of assistance during July 1988-March 1989 included electricity generation, fertilisers, textiles, miscellaneous chemicals, electrical machinery, sugar and rubber. Assistance sanctioned to backward areas and no-industry districts during the period amounted to Rs 1,812 crore as against Rs 1,208.8 crore during the same period of the previous year and its share in total assistance increased from 39.1 per cent to 40.4 per cent. IDBI has also been paying greater attention to the needs of the small-scale sector in the last few years. At Rs 1,260.8 crore, assistance to small-scale industries and small road transport operators through the IDBI's refinance scheme during the nine-month period under review registered a growth of 29.8 per cent over the previous corresponding period. In addition, the assistance sanctioned through various schemes operated under the Small Industries Development Fund (SIDF) recorded a growth of 29.6 per cent during this period to Rs 1,490.9 crore.

With a view to extending a measure of protection to borrowers of foreign currency loans against exchange risk, a scheme called the Exchange Risk Administration Scheme was evolved by the three all-India financial institutions in respect of projects supported by institutional assistance and involving import of capital goods costing Rs 25 crore or more.

In keeping with its promotional role, IDBI assisted 276 Entrepreneurship Development Programmes (EDPs), including 64 for science and technology entrepreneurs, 35 for women entrepreneurs and six for ex-servicemen. The integrated scheme of assistance to women entrepreneurs which provides for identification, selection, training, consultancy and escort services, apart from term loan facilities on concessional terms, continued to receive increasing response. Assistance to women entrepreneurs during July 1988-March 1989 rose to Rs 10.4 crore in respect of 323 units against Rs 3.5 crore sanctioned to 210 units during July 1987-March 1988.

The offtake from the newly constituted National Equity Fund has been rather poor. The equity fund with a corpus of Rs 10 crore contributed equally by the government of India and IDBI was launched to provide a fillip to the development of small industry. The IDBI's report says that a review of the National Equity Fund was undertaken to widen its scope and coverage. Accordingly, the scheme has now been extended to the State Bank of India and its associate banks. With this extension, the entire public sector banking network is now covered under the scheme.

In view of its expanding operations, IDBI had to raise substantial resources internally as well as externally. Total internal resources raised during the nine-month period, July 1988-March 1989, amounted to Rs 4,971.2 crore comprising: (i) increase in share capital contributed by central government of Rs 45 crore, (ii) borrowings/grants/deposits of Rs 2,409.1 crore, and (iii) internal generation of funds by way of repayment of past assistance, receipt of interest, discount, commission and sale of investments of Rs 2,517.1 crore.

As for foreign currency resources, IDBI has so far contracted nine lines of credit from the World Bank group totalling US $ 520.35 million. Since July 1988, it has raised a loan of 10 billion yen from a Japanese bank, 250 million Deutsch marks from West Germany through a public bond issue and a second line of credit equivalent to $ 40 million from Nordisca Investeeringbannken (NIB). Further, its drawals from the government against IDA/World Bank credit lines aggregated Rs 80.9 crore during the period. According to reports, IDBI would soon raise a credit of 20 billion yen in Japan and it is negotiating a large loan from the World Bank.

While the operations of the IDBI have registered significant growth, the attention paid to the rehabilitation of sick units and technology upgradation appears inadequate. As at the end of March 1989, IDBI had on its portfolio as many as 235 sick units involving outstanding term loans of Rs 484 crore. Rehabilitation assistance during the period under review was a meagre Rs 16.3 crore to 21 weak/sick units. Under the technology upgradation scheme, assistance sanctioned during this period amounted to Rs 5.1 crore to four projects against Rs 11.2 crore to three projects during the corresponding period of the previous year.

TWENTY YEARS AGO

EPW, Special Number, July 1969

From 'Capital View' by Romesh Thapar

It's been a long haul for Indira Gandhi. Three years of self-imposed indecision, status quoism, *ad hocism*, frustrations and inhibitions, and the inevitable loneliness at the summit of power. Then, suddenly, as if out of the blue, critical decision-making—bank nationalisation.

The Indira Gandhi who has been handling affairs since the end of the Bangalore AICC Session is in many important and significant respects very different from the woman the so-called 'chieftains' of the party have been dealing with—or pushing around!—until now. It's a wonder that the oldsters haven't collapsed from the shock because many of their comfortable confabulations are now a heap of wreckage.

Everyone in the Capital is asking the same question: what persuaded Indira Gandhi to choose this moment to launch her ferocious and sustained assault on the men who have been trying to hold her captive. The pen-pushers who have been projecting their own survival stratagems into the prime minister's reasoning conveniently forget that if she had so decided she could have continued as a 'leader' subservient to the Syndicate or any other cabal of powerful managers.

She decided to take an opposite path—and for very good reasons. The nation had to be lifted, dramatically, with courage, to a new plateau of hope and aspiration or else the system would not have been able to cushion the mounting tensions. The nationalisation of leading banks in the country marks the opening of a qualitatively new phase in Indian development.

* * *

Brezhnev's broad hint that the Soviet Union would like to see the emergence of a collective security system in Asia and Nixon's visit to a number of south and south-east Asian countries are indicative of the urgency with which the two super-powers are approaching the problem of adjusting their policies and postures to the changed realities in Asia. In all probability neither Moscow nor Washington has yet decided what its Asia policy in the seventies ought to be and the moves recently made by them may be viewed as part of the spadework that precedes fundamental changes in the Great Powers' policies. While the exploratory nature of Nixon's trip is obvious, the Soviet Union also is trying to keep a number of trial balloons aloft at the same time and there is a degree of lack of finality in what various Soviet dignitaries have been talking and writing about Asia. It is certain, however, that both perceive a number of new elements in the Asian situation and that both are anxious to revise their Asia policies in the light of the emerging realities.

The three major factors making for a systematic change in Asian politics are by now clear. First, western influence which has for long been preponderant in large parts of Asia, particularly in the regions bordering the Indian and Pacific Oceans, is now declining and can at best play a relatively muted role in the affairs of the continent. Second, the Sino-Soviet conflict is replacing the Soviet-American and the Sino-American conflicts as the central feature of power rivalries and strifes over a large area, extending from North Korea to Mongolia to Afghanistan to India to North Vietnam. Third, some Asian countries, particularly Japan, are now ready and willing to play a greater role in Asian affairs. The new system of Asian politics that will evolve in the seventies will be determined by all these three factors and the attempt of the Great Powers is to begin to influence the course of history in a manner that will best serve their national interest.

NOTICE

It is hereby notified for the information of public that **BOMBAY BREWERIES LIMITED** who hold a COB Licence for setting up a Beer manufacturing unit at Village Savla, Dist. Colaba in the State of Maharashtra, propose to make an application now to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section(s) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the change of location of the proposed undertaking to the MIDC Industrial Estate at Taloja, Dist. Raigad, where they have been allotted the required Industrial Plot for setting up the unit. The change in location of the undertaking has been necessitated by the earlier site being included in the Green Zone by the MBRDA. Brief particulars of the proposal are as under:-

1.	Name & Address of the Applicant	: **BOMBAY BREWERIES LIMITED** Ewart House 22, Homi Mody Street BOMBAY 400 023
2.	Capital Structure of the applicant organisation	: Authorised Share Capital : Rs. 75,00,000 Issued, Subscribed & Paid-up Capital : Rs. 3,00,100
3	Management Structure of the applicant organisation indicating the names of the Directors, including Managing/Wholetime Directors & Managers, if any	: Mr. P.Y. Navalkar — Director Mr. R.S. Shroff — Director Mr. S.J. Diwadkar — Director
4.	Indicate whether the proposal relates to the establishment of a new undertaking or a new Unit/ division	: The proposal relates to the changing of location of the undertaking holding a valid COB Licence issued by the Government of India from Village Savla, Dist. Colaba to Taloja Indl. Estate of MIDC, which change stands approved by the Government of India, Ministry of Industry vide their letter no. 1(46)/88-IG-cum-IA.I dated 23.5.89, subject to the issue of formal approval.
5.	Location of the new undertaking/unit/division	: Taloja Industrial Estate of MIDC, Dist. Raigad.
6.	Capital Structure of the proposed undertaking	: As given against '2' above.
7.	In case the proposal relates to the production, storage supply, distribution, marketing or control of any goods/articles, indicate:	:
	i) Names of goods/articles	: Beer.
	ii) Proposed licenced capacity	: 50,000 HL per annum
	iii) Estimated annual turnover	: Rs. 5.0 Crores
8.	In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	: Not Applicable
9.	Cost of the Project	: Rs. 9.2 Crores
10.	Scheme of finance, indicating the amounts to be raised from each source	: The project cost would be met through Equity share Capital, Debentures etc. Equity Capital — Rs. 92 lakhs Debenture — Rs. 92 lakhs Public Issues — Rs. 736 lakhs TOTAL — Rs. 920 lakhs

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi within 14 days from the date of publication of this notice, intimating his views on the proposal and the nature of his interest therein.

for **Bombay Breweries Limited**

S C MARFATIA
(Secretary)

Dated this 21st day of July, 1989.

SINGARENI COLLIERIES

Applying Modern Technology

SINGARENI COLLIERIES has a tentative investment for the Eighth Plan period of Rs 2,358.00 crore to achieve a targeted production of 335.90 lakh tonnes in 1994-95, i e, the terminal year of the Eighth Plan. Singareni Collieries has taken a number of steps to modernise their mines by introduction of a number of mechanisation schemes. Load haul dumpers/side dump loaders have been successfully used in some of the underground mines for mechanised coal loading and it is planned to extend the same to other mines wherever feasible. It was for the first time in the country that load haul dumpers have been utilised for extraction of pillars at GDK-9 Incline. This technology would be extended further to other mines for speedy extraction of coal standing in pillars. Singareni was the first coal company in India to introduce AM-50 road headers for drivage of gate road ways for forming retreat longwall faces in 1978. At present road headers are working in Kothagudem, Yellandu, Mandamari, Srirampur and Godavarikhani group of mines for formation of longwall faces. The first longwall face was commissioned at GDK-7 Incline in 1983 using double ended ranging drum shearer, self advancing powered supports and twin chain armoured faced conveyor for winning coal. The second face at Venkatesh Khani No 7 Incline was commissioned in June 1985. Singareni would like to progressively increase its mechanisation plans in the years to come by introducing 12 more longwall faces in Jawahar Khani-5, Godavarikhani-11A, GDK-10A, GDK-9 Vakilpalli block, Ravindrakhani-1A, Ravindrakhani-NT, Goleti 1 and 2 and Prakasham Khani-2 Inclines during the Seventh and Eighth Plan periods.

Thick coal seams occurring at shallow depths are suitable for opencast method of mining. Singareni Collieries has adopted this method of mining with advantage wherever conditions are favourable by introducing the heavy earth moving machinery available in the country. The heavy earth moving machinery mainly used in the company's opencast mines are RBH drills up to 250mm diameter, rope and hydraulic excavators up to 5 cu mtr capacity, 50T dumpers, 400/410 HP dozers, scrapers, etc. A large sized dragline with 96 metre boom and 24 cu mtr bucket is in operation at the opencast mine at Ramagundam. There are 8 opencast mines in operation and two more opencast mines are under construction at Ramagundam. Some more opencast mines are planned to be opened in the near future. It is also proposed to introduce 10 cu mtr shovels in combination with 85 tonne dumpers at the Manuguru Opencast-II mine and RG-OC III mine and the latest method of opencast mining with inpit crushing technology in conjunction with belt conveyors and spreaders at our Opencast-II, Ramagundam.

The Opencast Project-II, Ramagundam is a major project planned by Singareni with a targeted production of 2.00 million tonnes per annum. The project has been contemplated on 'Inpit-Crusher-Conveyor Technology' for the removal of overburden as well as coal. This project has technical and financial assistance for implementation on A to Z concept basis from the Federal Republic of Germany.

No 3 coal seam at Godavarikhani-10 Incline underground mine is 11 metres thick. Presently Singareni does not have an efficient method of extraction of such thick seams. As such, it was planned to introduce French technology for mining the thick seams using a special method known as 'Blasting Gallery Method' which will start production during 1989-90. The help of USSR experts was taken for preparation of a master plan for Godavari Valley Coalfield, and also for preparation of technical recommendation and reports for PK 1 and 2 Inclines, Goleti-1 and 2 Inclines and RK New Tech for achieving optimum production of coal. It is proposed to utilise the assistance of USSR, UK and Poland for development of new coal projects and sinking of deep shafts for underground mining.

KALPATARU IRRIGATION SYSTEMS

Agribusiness Venture

KALPATARU IRRIGATION SYSTEMS, promoted by Kirloskar Consultants, will produce and supply drip irrigation equipment. The dripper or the emitter is the heart of the drip system. There are two types of drippers. One is imported from HB Plastics, Austria, which manufactures a pressure compensating dripper which is self-flushing and non-clogging. This dripper gives a uniform discharge over a wide pressure range. Further it goes into flushing mode every time the system is started which makes it non-clogging. Kalpataru are the exclusive dealers for HB Plastics, Austria. The other dripper is an indigenously developed one. It can be opened and cleaned whenever it gets clogged. It gives a discharge of 4 litres per hour.

Besides the drip system, Kalpataru has plans of entering into other agriculture-related fields like tissue culture, seed production and green houses technology. Kirloskar Consultants has funded experiments on tissue culture at the Dharwad University. The government has recently liberalised the imports of seeds. The company will start with importing vegetable seeds and later on produce vegetable seeds on associate farms. Tissue culture technology will come very handy for this venture. Negotiations with some foreign seed producing companies are already under way. Kalpataru also intends to bring in green house technology, after appropriate modifications, taking local needs into consideration.

APSFC

Cumulative Sanctions Cross Rs 1000 Crore

ANDHRA PRADESH STATE FINANCIAL CORPORATION (APSFC) sanctioned an amount of Rs 169.5 crore during 1988-89, recording a growth rate of 29 per cent over the previous year. The corporation disbursed an amount of Rs 113.24 crore against an amount of Rs 102.49 crore during 1987-88. The corporation's cumulative sanctions at the end of 1988-89 were Rs 1039.2 crore.

The corporation has decided not to collect service charges for loans upto Rs 1 lakh to help the tiny sector units. It has reduced the interest rate by 1 per cent for industrial units who employ women to the extent of at least 50 per cent of its employees with the objective of creating better job opportunities for women in the industrial sector. The corporation gave priority to tiny and small enterprises. It sanctioned an amount of Rs 124.48 crore to 3776 tiny and small-scale units. This constitutes 94.42 per cent of total number of sanctions and 73.41 per cent of total amount sanctioned. During the year, the corporation sanctioned an amount of Rs 103.95 crore to 2283 units located in centrally declared backward areas. Total sanctions to the industrial units located in all the categories of backward areas during the year were Rs 113.84 crore to 2472 units. This constitutes 69.5 per cent in terms of amount and 68.8 per cent in terms of number.

PSSIDC

hifting Emphasis

PSSIDC has reported a corporate turn-er of Rs 17.89 crore and agency turn-er of Rs 32.89 crore in 1988-89. The cor-rate turnover, sales from production its and supplies from the marketing sistance scheme are slightly lower than e levels achieved in 1987-88. The cor-ration's working results show a net loss Rs 28.45 lakh; the loss was Rs 45.23 kh during 1987-88. While the corpora-on had in its earlier years covered several ctivities like capital participation, con-ruction of industrial estates, supply of quipment on hire purchase, supply of raw aterials, running production units and eneral engineering workshops and pro-iding marketing assistance to small-scale dustries, there has been a shift in em-hasis and concentration on only raw aterial supply and marketing assistance, ollowing the suggestions given by PEMB 1985-86.

IYDERABAD ALLWYN

Decline in Profitability

IYDERABAD ALLWYN has completed he financial year 1987-88 (17 months) with a profit (before tax) of Rs 4.48 crore s against Rs 3.47 crore in 1986-87 (12 nonths). The company achieved a turn-over of Rs 192.48 crore as against Rs 108.00 crore in the previous year. At the end of financial year, the book value per hare and the earnings per share respec-ively stood at Rs 33.70 and 4.71. The company has declared a dividend of 15 per cent. The company has registered growth in all its contract products, viz, buses, *Shaktiman* cabs and floors, and LPG cylinders. Production and sale of refrigerators stood at 1.37 lakh. Sales of watches have touched a level of 1.6 million compared to 1.1 million during the pre-vious year. The production and sale of watches would have been much higher but for the fact that the production and sale of quartz analogue watches was seriously affected by inadequate supply of a canalised item, namely electronic circuit board to a tune of 0.2 million.

COLGATE-PALMOLIVE (INDIA)

High Profitability

COLGATE-PALMOLIVE (INDIA)'s directors have recommended an issue of bonus shares on a one-for-one basis by capitalising Rs 15.72 crore out of the general reserves of the company. They have also proposed a final dividend of 9 per cent a total of 45 per cent for 1988. The company has produced good working results. Sales have amounted to Rs 206.07 crore against Rs 162.79 crore in 1987 and gross profit is Rs 46.03 crore against Rs 32.48 crore, reflecting enhanced profit margins. Net profit is Rs 21.24 crore compard to last year's Rs 16.81 crore in spite of higher necessary provisions, leaving as much as Rs 14.17 crore (Rs 8.80 crore) for transfer to reserves. Total equity dividend is covered 3 times by earnings as against 2.40 times previously.

The company received a licence from the government for producing 24,000 tonnes of fatty acids. It has also registered with DGTD for production of 30,000 tonnes of toilet soap which falls in the category of delicensed industries. Orders have been placed for setting up a fatty acid pland with a capacity of 20,000 tonnes and a toilet soap plant with an initial finishing capacity of 15,000 tonnes per annum. These manufacturing facilities will be locatd in the Waluj Industrial Area at Aurangabad in Maharashtra where the company has already acquired a large plot of land to provide for present and future requirements. Production equipment for toothpowder has been transferred from the Sewri factory in Bombay to the new factory built at Aurangabad in order to reduce congestion in the Sewri factory. Production of toothpowder has commenced in Aurangabad from the beginning of this year and has been discontinued at the Sewri factory since December 1988. This shifting of toothpowder production from the Sewri factory to the Aurangabad factory has been done after obtaining necessary approvals from the appropriate government authorities and assurance has been given that there will be no retrenchment of workers at the Sewri factory as a result of this move. The total capital investment in Aurangabad over the two year period 1988 and 1989 is estimated at around Rs 30 crore. The company is in the process of setting up a modern R and D facility at Aurangabad, which will undertake the development of new products and packaging in body cleaning and other related product categories. During 1988, the company was able to generate export earnings of Rs 41 lakh. Further, export orders worth Rs 200 lakh booked in 1988 have been executed in 1989. The total foreign exchange utilised during the year amounted to Rs 707 lakh.

Calcutta Diary

AM

The government consists of class enemies, but the external policy of class enemies, through some sleight of hand, gains acceptance as the right and proper policy for the Left to follow, even if it in effect means support to imperialist—and sometimes even fascist—causes, lock, stock and barrel.

THE international fraternity of socialism has ceased to be, no communist party is any longer its brothers' keeper. So the Left in our land need hardly feel apologetic over either the convulsions in east Europe or the tragedy in China. If they nonetheless have to be shame-faced in the current season, it should be on account of other reasons, reasons touching on developments nearer home. A socialist or a communist is a fake if he is not, in the first place, against imperialism. But how many within the ranks of the Left in the country have taken the trouble to go on record against the manner the national government has gone about, and continues to go about, to establish its hegemonic status against the regimes of Sri Lanka and Nepal? To argue that none others have protested will be fakery too. A communist or a socialist is not supposed to hang with the conformist crowd; he or she is expected to have his or her moorings in ideology. He or she, in other words, must not be afraid of being marked out as a non-jingo. Instead, there are torrents of convoluted sentences which place ambivalence on the pedestal, heap after heap of ifs and buts, absurd syllogisms in justification of equally absurd official standpoints. It could be the unquiet memories of 1962, and the fear of being charged, once more, of treasonous conduct. Or it could be a more straightforward sojourn towards the direction of Calvary: socialist convictions are all right, but look here, Left ideology must not interfere with our pan-Asian aspirations; since our system is more progressive than either Nepal's or Sri Lanka's, our troops and our intransigence will be good for the people in these minor countries, it is our socialist task to teach them how to curtsey and obey; it is as if we were selling coconut water which, they could take it from us, was good for their daughter.

And it is assumed that protests emanating from these countries have no objective basis. Since Nepal is an absolute monarchy, its government has no business to demur if we insist on foisting unequal treaties on it. Given its class alignments, our government in New Delhi cannot be faulted for the kind of argument it has mounted: to it, the existence of one category of exploitation provides the rationale for the introduction of a second category. In any case, the unscrupulous Indian traders and businessmen who, for decades on end, have squeezed the Nepalese countryside dry can legitimately look for protection and support to the Congress(I) leadership; there is a filial link. This convenience is not available for the parties on the Left; between the hucksters operating along the border and them, it would be awesomely difficult to establish any ideological or class links. It is, rather, classical 'tailism' at work: our government rails against Nepal, it is our patriotic duty to forsake both thinking and ideology and follow, blindly, the government's line.

In regard to Sri Lanka, the ideological betrayal is of a much graver nature. In tired-sounding resolutions that faithfully follow one another, the point continues to be made that the IPKF presence in the island is a blow against the United States navy's malevolent intentions apropos of Trincomalee. This is tommyrot. The IPKF went into Sri Lanka with the full blessings of the American administration, which, for its own reasons, will not for the present mind India's playing the role of regional constabulary. It is unsporting on the part of the Americans but, as of now, they are not particularly interested in bailing out the purveyors of hackneyed phrases along Indian shores. What get written or, rather, re-written are yesterday's resolutions by persons who are reluctant to face today's truth.

Is there any means of walking away from the basic truth? In Sri Lanka, the Indian troops are an army of occupation. The established government there wants it to go. The official opposition wants it to go. The insurgency opposition wants its departure. The Sinhalese-speaking never liked it; the overwhelming majority of the Tamils now abhor it; the Muslim community, otherwise known as moors, have declared that the country's problems cannot be resolved till as long as foreign troops interfere with the country's administrative processes. Just ask the Left in Sri Lanka, ask the Communist Party, ask the Sama Samaja Party, or ask Vijaya Kumaranatunge's widow: they are all agreed that no ground exists justifying the continued presence of the IPKF on Sri Lankan soil.

The Left, if they cannot afford to be honest with the world, must at least be honest with themselves. They have to admit, at least to themselves, that the people of Sri Lanka have the absolute right to abrogate the terms of an agreement initialled by their past president. This is

the core of national sovereignty. It is here irrelevant whether Ranasinghe Premadasa is a skunk or a scoundrel, whether his government is tottering, whether he has pitched his demand in the manner he has because the Janata Vimukthi Peramuna has caught him by the throat. It is equally irrelevant whether, following the departure of Indian troops, a dark night of anarchy descends on Sri Lanka. It is a free people's inalienable right to choose anarchy if they so decide. One who believes in exporting order, and enforcing such order through the intermediation of foreign troops, is no socialist. The resolutions he composes cannot cloak the nakedness of the fact that his or her claim to belong to the Left is sheer flippancy, or worse.

Hypocrisy of course does not believe in conforming to the bounds of consistent behaviour. Thus, at one end, the government in New Delhi will insist that the IPKF is for ever, because Junius Jayewardene's commitment cannot be brushed aside by his successor, and Indian troops will see to it that it is not brushed aside. At the other end, the same government has not the least doubt in its mind that, as far as Nepal is concerned, continuity in policy is an invalid concept: way back in 1978, Morarji Desai might have agreed to sign with the northern neighbour a transit treaty which was separate from a trade treaty, but indulgences of this nature are not to be permitted circa 1989.

Must the Left go along with such chicanery? Should these great issues which involve relationship and behaviour with foreign nations be left to the care of a handful of professional drafters of resolutions who, perhaps for their private reasons, seek the easiest way out and toe the government's line? The government consists of class enemies, but the external policy of class enemies, through some sleight of hand, gains acceptance as the right and proper policy for the Left to follow, even if it in effect means support to imperialist—and sometimes even fascist—causes, lock, stock and barrel.

On their way to the aspired popular democratic revolution, the Left must have stumbled, and stumbled badly. Otherwise how does one explain such extraordinary developments as that while furious debates are pursued over the merits and demerits of perestroika and glasnost, and a central committee can meet over and over to decide whether the students at Tiananmen Square were misled by alien ideology entirely on their own or whether their deviation is attributable to some confusion over ideology and praxis right at the level of the China party's leadership, no notice is taken of the fact that we, one of the poorest nations on earth, have been the world's largest importer of armaments—amounting to, on the average, Rs 7,000 to Rs 8,000 crore annually—for the past three years. The prime minister, in his altogether freewheeling manner, brands as anti-national whoever criticises the launching of the intermediate range ballistic missile, Agni; there is not one statement from the Left condemning the prime minister's wild charge. To oppose Agni and similar other resource-wasting defence projects and to deploy the funds thus saved for expanding programmes for primary education, irrigation, health and nutrition could, in certain circumstances, be manifestation of the highest forms of patriotism. But, sorry, to utter this basic home truth is no longer considered to be a compulsory obligation of a Left ideologue.

The Left are learning, and learning fast. Once upon a time, it was a simple world, the Left consisted of star-struck idealists, they had their undeviant, undeviable morality, they could distinguish good from evil and vice versa. The Left have left behind, or so it seems, those innocent days. They can now discover streaks of good in evil. And they compose their spidery resolutions accordingly.

Is there a wrench in the heart? But, don't you know, the heart has ceased to matter.

POTOMAC MUSINGS

Law's Aim Is Crime

Deena Khatkhate

The overweening position of lawyers in American society points to the way social and political relations have evolved in the US over the last 200 years. It is bargaining all the way and constant striking of deals. In this setting, the lawyer is king.

LAW is a binding covenant of a civil society because the condition of man is a condition of war of everyone against everyone. The predators have to be reigned in by law, this was the ancient gospel. Reason is and should be the life of law. If freedom is traduced, honour is besmirched, violence runs amok and if human life is to be more than an interregnum between birth and death, some codification of behavioural rules is necessary. But we are not presently living in a Lockean world where the beginning of law marks the end of tyranny. In these civilised times, laws become a burden, weighing us down at every stage of the conduct of our business. Democracy they say is rule by law, which gives you security, certainty and a certain predetermined course for your actions. Yes, democracy is the antithesis of dictatorship with its law of the jungle. And yet living here in the world's most enlightened democracy, to which not only ordinary people like us but also the Gorbachevs and the Zhaos of the declining communist empires are paying homage we are constantly lost in the jungle of laws and their diabolical practitioners. If you are born, the lawyer is there, like a doctor at the birth of an heir to the throne of the British empire, lurking in the distance to verify whether you are a test-tube baby, a baby of a surrogate mother or a baby by your legal father. In a society where 50 per cent of new marriages are dissolved in two years, and 40 per cent in the next five years, it is the lawyer who becomes your guardian angel and also godfather. If you fall ill, lawyers hone their wits to save you, not necessarily from death, not even from the doctor's bills, but from his maltreatment if only he can prove it so. You may be touched by his kindness when he tells you that you should not worry about his fees. He is a do-gooder, with the interests of all at his heart. You just give your consent and he will get you the compensation by proving in court that the treatment by your doctor or his coadjutors was wrong. He will be modest enough to keep for safe custody one-third of what he would collect from the doctor. If you survive, you will be a millionaire, if not your progeny will inherit the windfall, if your lawyer does not get into the act further to settle your inheritance.

But you should not be a sloppy moron to shed tears for your doctor. The doctor is safe with his malpractice insurance policy and an ever growing phalanx of lawyers has seen to it that they and those insured are well protected. The laws devised are complex, periphrastic; institutional memory is non-existent; case law is law which changes with every case. Lawyers are touchingly humanitarian; they have large hearts and have an abiding interest in those who are indicted for crime or fraud. Isn't presumption of innocence a basic tenet of their praxis? A Chinese was indicted a few days ago for the old-fashioned crime of murdering his wife for the old-fashioned reason that his wife had a paramour. A clever-clever lawyer and a cleverer-cleverer judge saw this tragedy through a prism of sociology and a bit of anthropology. They put the blame for the murder on the cultural background of the husband and he was set free. The Chinese in China, perhaps because of their preoccupation with the struggle against Deng

and Li Peng, may not have heard of this verdict. Otherwise they would have rediscovered their lethal weapons of punishing others.

Lawyers in America have spawned such a strange culture that one benign soul despaired for the future for this society: "There is no tragedy without liability, no vice without villains." See what havoc this litigious frame of mind of the Americans has caused them. There is a pregnant woman in California who guzzled half a bottle of bourbon every day during her pregnancy at the end of which she delivered a retarded child. On the advice of her lawyer that it could be a product liability suit, she filed a case in court against the makers of Jim Beam bourbon for failure to warn her that drinking bourbon during pregnancy would cripple her child. There is another who smoked incessantly and was hospitalised with cancerous lungs. Since the cigarettes she smoked caused the cancer, she sued the tobacco company and was awarded $ 4,00,000 compensation. A young couple rented an apartment in a condominium owned by an orthodox Catholic lady. When she knew that the couple renting the apartment were not married, she gave them notice to quit on the ground that an unmarried couple could not indulge in sexual activity, at any rate in her condominium. The couple was awarded handsome compensation.

Bizarre as these cases may be such suits have been elevated to a fine art by lawyers and political interest groups to mulct their rich clients. For the lawyer who won the case of the cancerous woman against the tobacco company, it was his investment in future tobacco litigation. The Bhopal disaster might have killed thousands of innocent people in that unfortunate city, but lawyers here were roused not by moral outrage, not by the gigantic human tragedy; they saw in it a golden opening for plunder and booty.

Even the simple prank of a teenager is exploited to the hilt by the lawyers for self-aggrandisement, without any concern for its social and moral consequences. A little black girl, intrepid, callow and footloose, absconded from house for fear of being smacked by her stepfather for absence from home late at night. She allowed her imagination to run wild and told the police who found her on a heap of garbage that she had been raped by some white boys, beaten up and left unconscious. The lawyers saw their chance for both money and publicity. Knowing fully that the story was a fib, they created a brouhaha about race relations and made unsubstantiated charges against the defence attorney. They almost succeeded but the truth was eventually out. The girl made up the story to save herself from a battering. But the lawyers, knowing the truth, did not relent and almost ignited a racial conflict.

It is a great conundrum of American society why lawyers and their cohorts are dominating not only the government but all other echelons of the social structure. Look around and you will see lawyers in the ranks of politicians, economists, academics, sportsmen and even the scientists. The overpowering position of lawyers points to the way social and political relations have evolved over the last 200 years. The president of the United States seems all-powerful and yet he is not; the Congress is supreme and yet it is not; the Supreme Court is the apogee of justice and yet it is not. Every organ of the government is a hostage to every other hand each one can be strong if it is allowed to be. It is bargaining all the way which ultimately climaxes into policy for the nation for good or evil. The government is only a mirror image of the society which is a potpourri of the diverse national and cultural groups which emigrated to America and they all survive through striking deals. And deals have to be negotiated. Social intercourse is conducted as a business. If guns are sought to be restricted, there is a lobby to fight the move, if restrictive practices in the medical profession are to be torn down, there is medical association to wage a battle to prevent it. If some foreign country wants a change in US policy to favour it, there are consulting firms galore staffed with people with talent for casuistry. Even law and order is negotiable with those who break it with impunity. Judges interpret the law but also encourage plea bargaining. You commit a heinous crime, then make pleas for lesser punishment by squealing on someone or the other. This is a game theoretic model of democracy; for every move of yours, there is a countermove. Who can do it better than a lawyer who, like Scarlet pimpernel, is everywhere. The American educational system may not throw up scientists, mathematicians, biologists, but lawyers are cheaper by the dozens, though the price they command defies the laws of demand and supply. They have made a bargain out of everything, uour life, your death, children, patriotism, justice, wife and marriage. If you don't play that game, you will be thrown by the wayside. In this kind of democracy, the lawyer is a necessity. Oliver Cromwell said of law and the lawyers: "Necessity has no law. Feigned necessity, imaginary necessities are the greatest cozenage that men can put upon the Providence of God and make pretence to break known rules by." But then who called Cromwell a democrat? Law and lawyers and part of democracy's kit. Those innocent Chinese students slaking their thirst for democracy, were shouting hoarse in Tiananmen Square in Beijing for "law and not party". If only they had known the worlds greatest democracy with its laws and what the lawyers have made of it all, they might perhaps have asked instead for "not party, not law, not rarefied democracy but reification of democracy".

Repression in Kashmir

A G Noorani

Cases of police atrocities are being reported with increasing frequency in Jammu and Kashmir. The national press and civil liberties groups appear to be unaware of this situation.

WE are by now used to harrowing stories of torture and faked encounters in Punjab but the national press has been sorely remiss in not reporting police atrocities in the state of Jammu and Kashmir. The task is being nobly performed by the daily *The Kashmir Times* edited by Ved Bhasin, a journalist highly respected for his integrity and fearlessness.

The issue of June 10, 1989 carries a report from the paper's Jammu correspondent on the death of Sarabjit Singh in police custody. He was one of the two alleged terrorists arrested in the evening of June 7 and "was allegedly meted out torturous (*sic*) death in the police custody though the interrogators claimed that he committed suicide". He was brought dead to the hospital where his post-mortem was conducted. The correspondent adds "Initial investigations revealed that the 'youth was tortured to death', with multiple injuries on his body." The government alleged that he had "consumed some poisonous substance as a result of which he died". A magisterial inquiry was ordered. The truth will be known.

The father of the deceased, Sher Singh, alleged torture and said that the body was blackened by it. It bore marks of multiple injuries and his knees, chest and legs had the signs of severe torture. "Isn't that enough proof of what the police had done to my son?"

In the Kashmir valley similar charges have been heard. On June 5, the People's Conference chairman Abdul Ghani Lone alleged the systematic practice of torture in interrogation centres, according to *The Kashmir Times* Srinagar correspondent Jafar Meraj who bears the torch of his late uncle Shamim Ahmed Shamim. Lone urged the central and state governments to find some political solution to the problems facing the people instead of resorting to brutal methods.

The correspondent reported:

> Lone charged the government with having hatched a conspiracy to make the arrested youth physical and mental wrecks by subjecting them to unprecedented physical and mental torture, both.
>
> He said that most of the arrested youth had fallen prey to one or the other disease and in this connection cited several examples. Habibullah Mir of Lonehari village in Handwara had developed heart trouble in the interrogation centre and was lying in a critical condition in Soura hospital. Ali Mohammed Mandoo of Gonipora in Handwara presently lodged in Hiranagar jail had lost his mental balance and had virtually turned mad. Both the legs of Abdul Ahad Butt of Wadipora Handwara had been broken in the interrogation centre and he was now fast losing his sight also. Mehmood Ahmad Sagar had developed heart trouble and none of his family members was allowed to see him nor was he being given any medical treatment.
>
> Mr Lone also doubted the government's claim about the alleged escape from police custody of the two prominent militants, Mohammad Ahsan Dar and Mohammad Nayeem Butt and said there were apprehensions in the minds of the people here that both had been physically liquidated by the police.

The charges are as grave as they are specific. If the people of the valley are not to feel alienated from the rest of the country a citizens' committee set up by the PUCL or PUDR or jointly by both should visit the state and report on the civil rights situation in both the valley as well as in Jammu.

Consider another detailed report in *The Kashmir Times* of June 2 by Arun Sharma:

> All the persons arrested from time to time in the state on the charge of being 'enemy agent' have been awaiting judicial trial for the last several years.
>
> Even after several years of their arrest the police has yet to present challans again[st] them in the competent courts. The accuse[d] in almost all such cases have, however, bee[n] bailed out by the courts.
>
> Though released on bail, a number of th[e] alleged 'enemy agents' who claim themselve[s] to be 'innocent' are awaiting judicial trial o[f] their cases to remove the stigma. However many others are reported to have crossed ove[r] to Pakistan, after securing bail from a com[-]petent court and yet the police appears to b[e] in no mood for presenting challans agains[t] the persons to whom it had once accused o[f] being 'enemy agents'.
>
> Such is the sordid state of affairs of th[e] law and order agency in the state.

Sharma's despatch is detailed and set[s] out the facts fairly enough. The net resul[t] he says is that not one alleged 'enemy agent' has so far been convicted by th[e] court either for want of police challan o[r] prosecution evidence. Meanwhile, no doubt the accused languished in jail til[l] they secured bail. What happens in jails we all know.

In a case decided on August 11, 198[8] (Mohan Lal Sharma vs State of Utta[r] Pradesh) by the Supreme Court, the chief justice R S Pathak remarked "we may note that we are gravely concerned at the increasing number of deaths which are reported of persons detained in police lock-ups". The court directed the CBI to make "a thorough and detailed investigation". It rejected the magistrate's report as unsatisfactory. The court acted on a telegram from the petitioner saying that his son Sanjay aged 17 years, was arrested by the Agra police on October 10, 1986 in the morning. He was not produced before a magistrate the next day as the constitution requires. He alleged that Sanjay was murdered by the police in the lock-up.

THE WORKING CLASS

Lessons of Hindustan Lever Lock-Out

Radha Iyer

The year-long lock-out at Hindustan Lever's Bombay factory, which was lifted last month, poses a crucial question for trade unions: can unions contain or reorient the development of larger economic forces in society? If not, then what policies ought unions to adopt during major phases of industrial transformation such as the present one? Is surviving to fight another day the only available option?

AMONG the recent agitations on the labour front the lock-out at Hindustan Lever was a major one. Apart from the fact that it involved 3,000 workers and one of the largest multinational companies and stretched a full year, the real significance of the lock-out lay in the fact that in it were crystallised the major issues confronting the trade union movement today.

Indian industries in general have been going through a phase of restructuring both internally and externally. The post-independence period saw the expansion and consolidation of a large organised private sector under the aegis of the 'licence and permit raj'. Protective state regulations nurtured Indian industries and helped them strike roots both in terms of technology and markets. All this gave birth to a stable skilled and organised workforce. This workforce was protected too. Laws governing arbitrary hiring and firing, reckless closures, retrenchments and lay-offs governed the organised workforce.

As industry outgrew this phase, it began to seek optimum utilisation of capital and labour. The small-scale sector grew in a big way with the help of numerous concessions and exemptions from licensing laws, excise duties and other industrial regulations. The organised industrial sector began to farm out unskilled and low technology jobs to the small sector. All this gave rise to a large unorganised workforce comprising workers in the labour-intensive small sector and the contract workers under labour contractors. The large industries retained the high skill, high technology jobs and the skilled workforce. The small sector was exempted from the protective labour legislation. Here hiring and firing, retrenchments, closures and lay-offs were simple. Employment of contract labour came to be legalised. With this, Indian industry was poised for further radical changes. The licence and permit raj has given way to liberalisation and protection to competition. Mergers, amalgamations, takeovers, diversifications and geographic relocations have become the characteristic features of this phase of industrial development. For the labour, these changes have had the most far-reaching consequences, throwing out of gear established trade unions, and protections gained through years of struggle, leaving them disoriented and groping for new ways and methods of protecting their interests.

Between 1947 and the late sixties the principal pre-occupation of trade unions was to fight for rights and privileges. The next phase from the late sixties to the late seventies was a turbulent phase in industrial relations, with numerous prolonged strikes and lock-outs throughout the country. The focus of these struggles was increase in wages, and invariably the increases in wages (often in the form of incentives) came to be traded off against rise in productivity and introduction of new technology in the organised industries. Since the eighties, however, the primary pre-occupation of unions in organised industries has become protection of jobs and the interests of workers in the face of inevitable job losses.

Sub-Contracting and Dispersal of Production

Hindustan Lever was a part of these processes and so was industrial relations in the company. During the mid-fifties and sixties the company grew as the premier unit in the field of soaps, detergents and edible oils. During this period trade unions were formed. The 1956 settlement between the union (then known as the Lever Brothers Employees Union) and the company (then known as the Lever Brothers (India) Private Ltd and the Hindustan Vanaspati Mfg Co Pvt Ltd) classified jobs after evaluating them. Each job and operation was classified on the basis of the job content, the mental ability required to perform it, the physical exertion, responsibility, education, training and so on, and on that basis grades were evolved and pay fixed. Earlier in 1[...] Standing Orders came to be introduc[...] laying down the conditions under wh[...] employees' services could be terminat[...]

By the seventies, the company began [...] develop the Garden Reach factory [...] Calcutta as the second most import[...] plant after its Bombay factory. It a[...] developed the Ghaziabad factory a[...] shifted part of Vim and vanaspati produ[...]tion there. The expansions were slow a[...] the pace steady. The thrust of the chang[...] during this period was in the producti[...] processes in the Bombay factory. Duri[...] this time, contract labour came to [...] employed in a big way in the Bombay fa[...]tory. Regular maintenance jobs, cleani[...] jobs, electrical and engineering jo[...] within the factory came to be handed ov[...] to labour contractors. Around the mi[...] seventies the company is estimated to ha[...] employed nearly 800 contract labours [...] the Sewree factory, which was a little le[...] than one-third of its workforce. Durin[...] this time the contract labourers too bega[...] to organise and demand absorption[...] which issue became the most sensitiv[...] issue in union-management negotiation[...] At this stage the permanent employee[...] through their union took considerabl[...] interest in the absorption of contrac[...] workers on the permanent rolls of th[...] company. The company absorbed a hand[...]ful of contract workers and signed a set[...]tlement with the union that employees[...] children would be given preference in th[...] matter of employment. With the job[...] becoming 'hereditary', so to say, the union lost interest in the absorption of contrac[...] workers.

From 1977 onwards, the compan[...] began to sub-contract production in a bi[...] way. This was quite a different thing from employing contract workers on the fac[...]tory's premises. Sunlight soap noodle[...] came to be sent out to small factories fo[...] cutting and packing. Inserting of tooth[...]paste in tubes was sub-contracted. The company began to plan sending other pro[...]ducts like Lifebuoy and toilet soap noodles to small factories for cutting, stamping and packing. This threatened the jobs of the permanent workers directly. 1980 saw a 40-day strike by the workers on the issue of sub-contracting of jobs. In 1980 came the new industrial policy statement. Winds of change began to blow, and the new catchword was modernisation. Geographical relocation became an important aspect of growth. It became clear to the company that it must take optimum advantage of these changes in the industrial climate. Modernisation meant reduction in the workforce. In 1981 the company stopped all new recruitment at its Bombay factory. This policy continued, except for a small break in 1985 when about 58-60 workmen were recruited.

Taking advantage of the concessions to backward areas for new industries, the company set up detergent plants at Jammu and in Chindwada around 1980. The Tiruchi plant which had been closed was restarted around 1978. The company also set up a vanaspati plant at Shamnagar. However due to the boom in the detergents and soap industries it was not yet necessary to actually reduce the output at the Bombay factory. In fact 1985 was the peak production year for the Bombay factory when production levels were the highest since the commencement of the factory. The company went ahead with the modernisation of its Bombay factory, investing nearly Rs 30 crore. A new cogeneration plant was set up. All this required extensive redeployment of existing workers.

Good-Bye to 'Participatory Management'

As pointed out earlier, the settlements arrived at during the first phase had detailed strict job descriptions, gradations and norms. These settlements continued to operate and were binding. They became major constraints in redeployment of labour. The present situation required flexibility in shifting workers from one job to another and one department to another. A showdown over this issue could lead to work stoppages which at that stage the company could ill-afford as alternative production facilities had not been organised fully and markets were becoming increasingly competitive. Modernisation could not be effectively implemented by antagonising workers, yet it had to be done. In industrial relations after 1981, the company adopted a policy of settling all issues with the union. 'Participatory management' became the keyword in industrial relations. After 1964 there had been no wage revision in the company for ten years as the issue was pending adjudication before courts. The next wage revision which was due in 1979 was settled bilaterally after agitation by the union. In 1981 the workers agitated for bonus, as over 50 per cent of the workers were outside the scope of the Bonus Act, their wages being above Rs 750 per month. This issue was also settled.

In 1982 a new wage revision became due. This time the company had decided to push the modernisation issue and barter modernisation and redeployment in exchange for wage increases. The charter was settled in September 1983. This settlement was qualitatively different from the previous ones inasmuch as for the first time the union agreed to modernisation on a limited scale and agreed to redeployment of 150 workmen in the modernised departments by mutual agreement. (The actual redeployment however was much higher as nearly 200 workmen were redeployed due to modernisation and 300 due to closure of certain departments.)

At this time it appears that the company had taken a long-term view of modernisation and had long-term plans stretching over 7 to 10 years—with another agreement like the 1983 settlement and the union agreeing to further modernisation and reorganisation, with another 300-350 workers due to retire, and with a voluntary retirement scheme inducing some 500 to 700 workers to go. So industrial relations could have gone along in conformity with the modernisation, restructuring and geographical relocation which was taking place in a big way.

Quickened Restructuring

By 1984-85 the pace of restructuring quickened. The company had completed the acquisition of Lipton India by May 1984. It planned to transfer production of all food products to Lipton. This meant closure of the vanaspati department in the Bombay factory. Between 1985 and 1987 the company set up a synthetic detergent factory at Sumerpur in UP, a toilet soap factory at Orai, also in UP, the installed capacity of the synthetic detergent factory at Chindwada was increased, a processed vegetable oils plant at the Kandla Free Trade Zone, it took on lease Union Home Products at Mangalore for manufacture of soaps and it acquired Stepan Chemicals and another company known as Shekar Engineering Industries. Later the Board of Industrial and Financial Reconstruction directed the company to take on lease Sunrise Soaps and Chemicals at Rajkot. The company had also set up a unit at Kamgoan. All this was in the field of soaps, detergents and vegetable oils—the industries to which the company had belonged in the past. Besides these the company also set up a garment factory at MEPZ and a functionalised biopolymers plant at Pondicherry for manufacture of footwear. The Haldia factory, which was basically a chemical factory, now came to be expanded for the production of Zeolite and synthetic detergents. Except the Haldia project, most of the other projects have already been completed or are likely to be completed and commissioned by the end of 1989 and the beginning of 1990.

By combining restructuring with 'participative management', i e, by a process of bargaining for modernisation and redeployment, introducing voluntary retirement schemes and banning all new recruitment in place of retired employees the company could have brought down its workforce in the Bombay factory to 1,000 by 1990-91, i e, by two-thirds of its present strength without any major showdown with its workers. But by 1986 the company's products began to face serious challenges in the market. Nirma took on Surf, then the bar soaps came to be challenged, and with Nirma coming out with soaps along with other smaller companies, the company seems to have been gripped with a sense of market insecurity. Added to this insecurity were certain policies and perceptions of the situation by the union. It is necessary to pause here and turn to the union and the developments within it.

The Union: Distinctive Features

Two important features of the trade union organisation in the company stand out clearly. One, the company has always had an internal union. The union was never part of any general union at any time since its inception. Second, the internal leadership was invariably influenced by persons who politically sympathised with the most radical trends in the communist movement in the country. In the fifties G Sundaram of the undivided Communist Party was the general secretary of the union. He was also the most militant and influential trade union leader then. During the early sixties, even though the union president was Raja Kulkarni of INTUC, the internal leaders and other office-bearers continued to be persons influenced by communists. When the CPI split, CPI(M) leaders emerged as militant left leaders and CITU's influence spread in Bombay. The Hindustan Lever Employees Union came to be presided over by the leaders of the CITU. Then CITU's influence in the trade unions waned and Bombay was gripped by the Samant phenomenon. By 1981, D R Samant became the president of the union but at least some of the internal leaders were either influenced by or sympathetic to the CPI(ML). All this had left the union with a certain strong tradition and ethos. Compared to other unions it was democratically run and at all times relatively free of corruption. Unlike many of the newer unions in the city, it was run at all times by persons who knew the basics of collective bargaining and trade unionism, and to that extent were more professional. Above all, whatever internal disagreements and contradictions that existed within the union and its active members, these never led to a split in the organisation. Hence there was never any overt trade union rivalry amongst the workers

By the early eighties it became clear to the union that job losses were going to emerge as the most important issue. In 1983 it was compelled to give some concessions regarding modernisation and redeployment. In 1986 the company decided to reduce the production of 'Rin' soap by more than half. The leaders at the Bombay factory were once again compelled to negotiate the issue and settle it in return for certain concessions in the form of grades and increments. It may be mentioned here that while the leaders of the Bombay factory against whom the company carried out a hysterical campaign during the lock-out, calling them extremists, naxalites and what not, settled the issue of partial closure of the Rin

department, in the Garden Reach factory in Calcutta, where also the production of Rin came to be stopped partially, the workers went on a prolonged agitation leading to wage cuts, dismissals and retrenchment notices by the company which was turned down by the government. In both cases the company achieved what it wanted objectively, namely, cutting down Rin production. In Bombay it was organised and smooth while in Calcutta it was through a show down with the union and workers.

Fear of Federation

By now it was clear that even if the restructuring of the company was smooth and done in a manner acceptable to the workers presently employed, at the end of it all the bargaining power of the union would be drastically reduced. The contribution of the Bombay factory would be reduced to 25 per cent of the company's profits at its best. It was at this stage that the union decided to activise the federation of Hindustan Lever employees. The federation had already existed, but had been ineffective. The Garden Reach factory, which was the second largest, had been outside the federation. The Bombay factory union established links with the Garden Reach factory. The Bombay factory and the Garden Reach factory together accounted for nearly 70 per cent of the company's production. The federation meetings in 1987 were euphoric. When the company imposed wage cuts and dismissals in Garden Reach, the Bombay workers went on a token strike and organised protest marches to the head office of the company.

A strong federation was considered to be fatal by the company. It could be a major obstacle to its restructuring plans. The nature of the company's products was such that it could not give out major production processes to smaller factories. Superior technology and economies of scale were needed to maintain its lead over its rivals in the market. It was therefore necessary for the company to set up its own capital intensive plants in backward areas with cheap labour, state incentives and savings on transportation costs. A federation would mean rise in wages and more bargaining power for the workers all over the country. Caught between market insecurity and the federation factor, the company seems to have decided to go in for a decisive show down with the Bombay factory union.

The first signs of this change in strategy became clear with the changes in top factory management personnel. Adherents of 'participative management' ideas gave way to hardliners in industrial relations. From 1987 the company began preparing for a show down. Production was diverted to other sources and units. The pace of subcontracting production to other industrial units was stepped up. In 1987 Rin production was stopped completely.

The immediate reasons for the lock-out were quite obviously provocative. In April 1988, the company directed some of the workers who had been rendered surplus due to closure of Rin department to do 'mathadi' work, i e, loading and unloading work. Loading and unloading work in Bombay is regulated by the Maharashtra Hamal and Other Manual Workers (Regulation of Employment and Welfare) Act under which Grocery Markets and Shops Board for Greater Bombay is established. The 'mathadi' workers are workers registered with the board and their service conditions are regulated by the board. The Mathadi Act prohibits employment of non-registered workers where registered workers are allotted by it. The company's demand was bound to be resisted and the company knew it. It may be mentioned here that the negotiations for wage revision had come to a dead end. The last wage settlement expired in June 1986 and a new settlement was being negotiated. For three years the company procrastinated over the issue. During the negotiations held in this period the differences had been reduced to minor issues. On all major issues it had been possible to arrive at some understanding. Yet the finalisation of the settlement dragged on, leading to discontent amongst workers.

Calculations Gone Awry

With effect from June 21, 1988 the company declared a lock-out. The principal object of the lock-out was to smash the union as an organisation. The decision to lock-out was founded on three important calculations. First was the company's assessment of its workers. The company did not think Hindustan Lever workers were capable of a prolonged fight. A few months of economic hardships would compel them to return to work, even if it meant bypassing the union and the leaders. If a large group returned, the company would have locked out the rest for as long as it wanted, since the internal restructuring had made it possible to carry on profitably with a minimal workforce. Even the most highly paid worker is in the final analysis a worker. To succumb and return, bypassing the union, is always a painful decision which every worker will try to avoid as far as possible. And none of the workers returned.

The company's second calculation was that there was bound to be some violence somewhere. Once this happened all the leading union activists could be implicated in criminal cases and detained in custody. The workers would then be without leadership and direction. The focus of the union's activities would shift from tackling the lock-out to defending their leaders. The company carried out a high-pitched propaganda against the important leaders in the press and particularly in government circles branding them as extremists and naxalites. In retrospect it appears that this was done so that if the leaders came to be arrested getting them released on bail would become extremely difficult. Even the chief minister made statements at his 'Janata Darbars', press conferences and public meetings that he would not intervene unless the workers had rejected the naxalite leadership. This calculation too failed. The company's aggressive campaign had made the union leadership extra cautious about violence. For this it was essential that the active workers did not get restless and go beyond the bounds of organisational discipline, which invariably would happen after a few months. It was essential that they were kept pre-occupied. It was at this stage that the union quite accidentally struck upon the idea of manufacturing and selling a symbolically parallel detergent powder which was given the brand name 'Lock-Out'. This move sustained the union in several ways. It kept the active workers pre-occupied with some activity and helped maintain union discipline. It created a great deal of sympathy amongst workers in the other factories in Bombay who enthusiastically welcomed 'Lock-Out' detergent. And it had great propaganda value amongst sections of the middle classes and the press.

The company's third calculation was that a rift between Datta Samant and the internal leaders given their totally different perceptions and policies was inevitable at some stage. Between Samant and the internal union, Samant was the lesser evil in the company's perception. When the rift occurred the company would deal directly with Samant. That would affect the credibility of the union and the internal organisation would become ineffective. This calculation too failed.

Stalemate

By the end of December 1988, the lock-out was reaching a stalemate. In December 1988 the company closed down its catalyst plant. Even though the company had arranged alternative sources and means for keeping its production lines going, the company was in no position to do without the Bombay factory altogether for an indefinite period of time, more so when competition in the market was very keen. The union was also under pressure by this time, but in December 1988 the workers re-elected the same internal leaders and decided to stand by the union. This boosted the morale of the union, but the pressure remained.

In February 1989 the company introduced a voluntary retirement scheme. The company calculated that workers would start leaving on a big scale and the union would buckle under the pressure of this large-scale exodus. The retirement scheme however proved to be another shot in the arm for the union. For all those workers

who had lost their staying power, this was an opportunity to get out honourably. About 450 employees out of 3,000 accepted voluntary retirement. As a result those that stayed on were workers who were willing to see the lock-out through till the end.

It was only at this stage that the company began to seriously seek the intervention of the government for resolving the dispute. Until then, though numerous discussions had been held before the labour commissioner, most of them were at the instance of the union and the company did not make any serious effort to meet the union half-way. By the end of May the chief minister began to take interest in the lock-out for the first time. By this time, numerous litigations came to be filed in various courts regarding different aspects of the lock-out and there was the added fear that somewhere some court order may go against the company. The workers coming back to work waving a court order would have been an impossible situation for the company.

Since the thrust of the lock-out was to smash the union, there were hardly many irreconcilable points when it came to negotiations. In June 1988, at the commencement of the lock-out, the union had approached the labour commissioner for intervention. At that stage the company had imposed nine conditions for the lifting of the lock-out. Of these the first one was that the 1983 settlement would be adhered to and the second the 1985 production levels would be maintained. Others related to redeployment, maintaining discipline in the factory and performance of jobs pending fresh job evaluation. Of the nine conditions the union had accepted seven. The one unacceptable condition was linking wages to productivity. This was opposed by the union. Such a practice does not exist anywhere in the country and is against the well established principles of region-cum-industry as the basis of fixation of wages. The other condition related to permanent workers doing 'mathadi' work which the union had agreed to resolve in consultation with the Mathadi Board. The company's demand for withdrawal of court cases the union was willing to consider upon some part of the lock-out wages being paid to the workers.

About-Turn

After one year of lock-out the chief minister himself came out firmly against productivity-linked wages. The company now insisted that they would not sign any settlement until the composition of the union committee had been changed and the president Samant, the vice-president and the general secretary had been excluded. Finally, even on this point it had been agreed that these three persons would not sign the settlement. At this stage the company did a complete about-turn. It abandoned tripartite negotiations and settlement altogether and made one last ditch attempt to throw the union out of gear. From June 21, 1989 it decided to unilaterally lift the lock-out, bypassing the union altogether. The pre-condition was that the workers were to sign an undertaking in the form of an individual settlement. The terms of the settlement were substantially what had been agreed to by the union in June 1988.

Once again the company's calculation was that a big section of the workers would immediately rush to the factory gate. Others would oppose the workers going back under the conditions imposed by the company and there would be confusion and chaos. Police had been mobilised in a big way at the factory. On the first day of the lifting of the lock-out the union too had fixed a general body meeting. All workers reported at the general body and none at the factory gate. The second day too none reported. The third day onwards groups were formed and workers reported in organised groups. At the general body meeting, workers decided everyone should go back and continue with the cases and challenge the individual undertaking, in the form of settlement, taken by the company. Though all workers returned, the union as an organisation had not been compelled to sign any compromising settlements. At the end of it the union remained and the leaders remained. Except one leader none had been dismissed. The litigations continue. For the worker it was no doubt a big come down to have to submit to individual undertakings. But looked at from the point of the purpose for which the lock-out had been imposed, namely, to smash the union organisation, things have come a full circle. Three days after lifting of the lock-out there was a morcha to the head office over a small issue.

Only Option?

The restructuring of the company which was the context of the lock-out continues even after the lifting of the lock-out. More than eight departments have been closed since then. The hard soaps and toilet soaps departments are partially closed and the process continues. But the wounds inflicted by the lock-out are likely to fester for a long time.

The Lever lock-out poses a crucial question for the trade unions, viz, can the trade unions, which are merely defensive organisations of workers within the existing framework, contain or reorient the development of larger economic forces in society? The answer is an obvious no. Then what policies ought unions to adopt during such phases of transformation as the present? Is surviving to fight another day the only available option?

Politics of Electoral Rolls

Congress (I)'s Two-Faced Role

On the issue of revision of electoral rolls in Assam, the Congress(I) is playing a two-faced role—appeasing Assamese sentiment in the Brahmaputra valley and simultaneously stoking the apprehensions of the so-called 'illegal foreigners'.

THE current controversy over the revision of electoral rolls in Assam shows how there are virtually no limits to the cynicism of the Congress(I) which is playing a double-faced role—of appeasing Assamese sentiment in the Brahmaputra valley and simultaneously inciting the passions and apprehensions of those sections of the state's population viewed by the majority of the people in the Brahmaputra valley as 'illegal foreigners'.

The revision of electoral rolls now going on according to a set of guidelines provided by the Election Commission has been attacked by virtually all opposition parties in the state—the Congress(I), the two factions of the United Minorities Front (UMF), the Congress(S), the CPI(M) and the Janata Party. Though all these parties have formally lodged protests with and submitted memorandums to the Election Commission, it is the protest by the Congress(I) (which has also threatened to seek legal redress in the Guwahati High Court) that deserves a closer examination.

The guidelines were issued by the Election Commission which, given the state of the institutions in the country, surely could not have acted without clearance from the union home ministry (read Congress(I)). And yet, the Congress(I) has been among the most vociferous in protesting against these guidelines. The Asom Gana Parishad (AGP) government which assumed office on the wave of the euphoria generated by the signing of the Assam Accord is sitting pretty over this simulated outrage of the Congress(I) leaders in the state, sure in the knowledge that the more the Congress(I) leaders foam at their mouths (even if only for the record), the greater will be its claim to be viewed as a party which had made advances in the implementation of the Assam Accord. But the AGP leaders too know very well that the guidelines cannot be fully followed in the revision of electoral rolls because of some grave lacunae: the crucial 1966 electoral rolls, which the Election Commission's guidelines say ought to be the reference point in establishing who is a foreigner and who is an Indian citizen in the cases of persons enumerated but about whose Indian citizenship the Electoral Registration Officers may have 'doubts', simply do not exist in their entirety.

The 'Guidelines'

But first, what are these 'guidelines' that have created so much of some genuine but mostly simulated indignation by the political parties of the opposition and only slightly less simulated sense of satisfaction by the AGP government?

As is well known, the Assam Accord provided for identifying two streams of illegal migrants into the state: one, those established to have entered the state illegally between January 1, 1966 and March 24, 1971; and two, those established to have entered the state illegally after March 24, 1971, the date on which erstwhile East Pakistan declared itself independent Bangladesh. Those in the first stream are to be *detected* in accordance with the provisions of the Foreigners Act, 1946 and the Foreigners (Tribunals) Order, 1964, after which their names are to be *deleted* from the electoral rolls in force; and "on the expiry of a period of ten years following the date of detection, the names of all such persons which have been deleted from the electoral rolls shall be restored"—in other words, *disenfranchised* for a period of ten years.

The second stream of illegal migrants, (post-March 24, 1971) "shall continue to be *detected, deleted* and *expelled* in accordance with law".

In other words, every illegal foreigner who entered Assam after January 1, 1966 is to be 'detected'; every such foreigner's name is to be 'deleted ' from the electoral rolls—those coming under one category (January 1, 1966 to March 24, 1971) for a period of ten years and the post-March 24, 1971 category permanently; and the latter category is also to be 'expelled'. It should be noted that the 'expulsion' of the second stream of illegal migrants is to be done according to the provisions of the Illegal Migrants (Determination by Tribunals) Act, 1983 (IMDT Act) while the first stream of illegal migrants (who are only to be disenfranchised for a period of ten years) are to be tackled under the provisions of the Registration of Foreigners Act, 1939 and the Foreigners Act, 1946, and the rules framed thereunder. These acts which were effectively (perhpas over-effectively) being applied to cover all the illegal foreigners in Assam till 1983 were deliberately made applicable selectively after that date by the passing of a new legislation, the IMDT Act, which is applicable only to illegal foreigners in Assam. Thus, an illegal foreigner who has to be detected and expelled is covered by the IMDT Act while a person in exactly the same situation in neighbouring Meghalaya is covered by the provisions of the Foreigners Act, 1946. The rationale behind such a transparent anomaly, involving the political calculations of the Congress Party in Assam and its traditional vote banks in the state (appropriated by the UMF briefly before the December 1985 elections but now in the process of being regained), is too large a subject to be gone into here.

AGP Reconciled

Predictably, the Assam agitation leaders who within weeks of signing the Assam Accord transformed themselves into leaders of a new regional party, the Asom Gana Parishad (AGP) and soon thereafter captured political office, found the going tough when it came to implementing the Assam Accord, especially those provisions of it covering the detection, disenfranchisement and expulsion of the impugned foreigners. They had anyway already made substantial compromises in signing the Accord and agreeing to 'regularise' all the presumed illegal foreigners established to have arrived before January 1, 1966, though one of the stated demands of the Assam agitation was that all illegal foreigners from 1951 (later 1961) were to be 'deported' (no vague reference to expulsion). They had also agreed that the post-March 24, 1971 illegal foreigners were to be 'expelled' without any indication in the Assam Accord how, and more importantly to which part of the world, such detected illegal foreigners were to be 'expelled'—and knowing fully that this stream of illegal foreigners was by then covered by the already enacted IMDT Act whose provisions are such that virtually no one can be 'expelled' under them.

Most importantly, after maintaining throughout the Assam agitation that the electoral rolls in Assam had become hopelessly contaminated because of the inclusion of the names of 'lakhs and lakhs of illegal foreigners' (the beginnings of the Assam agitation have to be traced to the efforts of the All Assam Students Union,

with the help of sympathetic officials in the state administration, to secure the removal of the names of tens of thousands of such presumed illegal foreigners from the electoral rolls of the Mangalaoi Lok Sabha constituency, before the by-election in the middle of 1979 which anyway could not be held) and indeed after enforcing a boycott of the February 1983 elections to the state assembly on the same grounds—and further boycotting the 'illegal' ministry headed by Hiteswar Saikia that assumed office after the February 1983 elections, the AASU leaders as AGP leaders fought the December 1985 assembly elections when electoral rolls based substantially on the 'tainted' 1983 electoral rolls were used. Since assuming office, the AGP has fought three by-elections as well as elections to the district councils in the two autonomous districts in all of which the electoral rolls used have been based on the electoral rolls of 1983.

Thus it appeared as if the AGP government had more or less reconciled itself to the realities of political office and had learned to live with the 1985 electoral rolls, though the campaign for revision of the electoral rolls in such a manner as to exclude from them the post-1966 illegal migrants was kept on—by the AGP in the form of statements and by the AASU through some low-key agitation programmes. The state government had anyway more serious problems on its hand including the agitation for a 'Bodoland' by the All Bodo Students Union led by Upendranath Brahma (ABSU-UB).

It was in such a situation, while the revision of electoral rolls was going on in a routine manner accompanied by low-key protests from the AASU, that the Election Commission issued its 'guidelines' on May 17 for the revision of electoral rolls in Assam. AASU which had threatened to launch an agitation on the issue happily withdrew the threat.

The guidelines provide for the preparation of two lists of all enumerated voters in the state. List I is to contain the names of persons enumerated about whose Indian citizenship the Electoral Registration Officer (ERO) does not consider it necessary to make further inquiries. List II is to contain the names of persons in respect of whom the ERO has reason to entertain doubts, "that is, persons who cannot be directly or through their parentage linked to the 1966 electoral rolls". These 'doubtful' persons' claim to be included even in the draft electoral rolls will depend upon their producing any of the following four documents (none of which an ordinary Indian citizen carries or possesses): (1) citizenship certificate issued by competent authority; (2) certificate of date of birth; (3) copy of the 'National Register of Citizens', a document prepared at the time of the 1951 Census about whose validity or even existence there has been some controversy; and (4) extract from the 1966 voters list or any pre-1966 voters lists establishing links with that document. According to opposition political leaders in the state, the 1966 voters list are available in respect of only some 52 or 53 out of the total of 126 assembly constituencies in the state. The guidelines clearly lay down that "any other document which is not free from doubt should not be relied upon". But on recent representations by the opposition parties the Election Commission is believed to have modified this directive and allowed the EROs to consider other documents admitted under the Evidence Act (like ration cards, etc) also as proof of citizenship. It is against these guidelines, which have come as a sort of a windfall to the AGP government that the opposition parties including the Congress(I) are protesting.

Curious Protest

That the UMF or the CPI(M) or the Congress(S) would protest against these guidelines is no cause for surprise for their stand on the Assam Accord itself is well known. But the protest by the Congress(I), which fully supports the Assam Accord, is most curious. For the guidelines arise directly from the commitments made in the Assam Accord regarding the disenfranchisement for a period of ten years of the January 1, 1966-March 24, 1971 stream of illegal foreigners. Indeed, the Citizenship Act, 1955 was especially amended by the Citizenship (Amendment) Act, 1985, by the introduction of a new clause (6-A) which gave legislative sanction to the commitment made in the Assam Accord about such disenfranchisement. Clause 6-A provides that "every person of Indian origin who came to Assam on or after the first day of January 1966 but before the 25th day of March 1971 from the specified territory, and has since the date of his entry into Assam been ordinarily resident in Assam, and has been detected to be a foreigner, shall register himself in accordance with the rules made by the Central government in this behalf under Section 18 [of the Citizenship Act, 1955] ...and if his name is included in any electoral roll for any assembly or parliamentary constituency in force on the date of such detection, his name shall be deleted therefrom". The Election Commission's guidelines only provide the necessary administrative direction to enforce this constitutional obligation—however unfair and potentially further divisive the legislation and the constitutional obligation itself might be.

For, it is the union government under the Congress(I) which signed the Assam Accord; it is the union government under the Congress(I) which amended the Citizenship Act, 1955; and one has to assume that it is with the clearance of the union government under the Congress(I) that the Election Commission has issued these guidelines. For the Congress(I) in Assam now to raise a hue and cry about these guidelines, even while maintaining that it is committed to the implementation of the Assam Accord, can only mean two things: one, that it is anxious not to alienate the majority Assamese opinion in the Brahmaputra valley without whose support no stable government is possible in Assam (so the guidelines had to be issued); two, but it is equally important to retain its traditional vote banks among the migrant population, apart from being sensitive to the opinion in the Barak Valley to which the influential union minister of state for home affairs, Santosh Mohan Dev, who is articulating the opposition to the Election Commission's guidelines belongs (and so the guidelines have to be opposed).

Now that the issue has become alive, some sort of a modification of the guidelines has become inevitable. But the guidelines cannot be modified unless the 1985 Amendment to the Citizenship Act, 1955, itself is further amended, if not scrapped. It is to be seen whether the union government will introduce such a controversial legislation in the current session of parliament (almost certainly the last session before the Lok Sabha polls). Any action in this regard will naturally depend on the Congress(I)'s assessment of the relative gains and losses to be made in Assam by letting things be, but allowing its unit in Assam to make some more noise, or tinker with the guidelines and once again rouse passions in the Brahmaputra valley.

Perhaps a slightly modified form of the old English saying would best explain the stand of the Congress(I) in Assam: that it is hunting with the hare and hunting with the hounds.

Medicine at Risk

Health Professional as Abuser and Victim

Amar Jesani

Health professionals are often involved, one way or another, in incidents of state torture. By participating in such acts they grossly violate several national and international codes of ethics. How can this abuse of human rights by health professionals be prevented? Equally importantly, how can doctors be protected from being coerced by the state to participate in torture? A report of the recent Amnesty International seminar on the subject.

AFTER the second world war the Neuremburg Trial exposed and punished scientists, including health professionals, who willingly or under duress participated in the large scale murders and torture and the cruel experiments on human beings in the Nazi concentration camps and elsewhere. It also highlighted the grim predicament of health professionals in the modern systematic organisation of oppression and repression by the state power. Just as the fascism scarred human history beyond repair, the findings of the Neuremburg Trial shook the health profession because it remained no longer possible to argue that inhuman misdeeds of these doctors were exclusively committed under duress. In fact research done later on established that a majority of doctors had thrown ethics overboard and had willingly accepted the fascist ideology of 'racial hygiene' which actually had inspired many to collaborate in inhuman acts at that time. Now we know that the period of fascism in Germany was marked by three types of doctors: The first category of fascist doctors dominated the scene; the second succumbed to the physical might of the fascist state and ended up as unwilling participants in the inhuman acts; the third resisted the pressure and paid for it with their lives, spent long years in jails while a few could escape out of Germany. Clearly, medicine under fascism shows the dual predicament of the health professional—the abuser and the victim.

Following the second world war, in the wake of the Universal Declaration of Human Rights by the United Nations, several codes of ethics related to human rights were adopted by various international organisations of health professionals. For about two decades after that no improvement in these codes was effected, although some discussion on a need to improve them took place. However, from 1968 the world political scene underwent a sea change. The mass upheavals in the developed countries, the Vietnam war, the anti-war movement, the killing of Allende in coup in Chile followed by massacre, etc, once again sensitised broader strata of people to the question of human rights. In the strife-torn world the health professionals suffered as well and many of them got sensitised to the larger ethical issues concerning human rights. Thus, the discussion which had begun in the late 1950s and the early 1960s on the inadequacies of the existing code of ethics related to human rights started getting crystallised in the form of concrete proposals in the 1970s. In 1975, in Singapore, the International Council of Nurses (ICN) adopted a resolution on the 'Role of the Nurse in the Care of Detainees and Prisoners'. In the same year, the World Medical Association (WMA) adopted its famous Tokyo Declaration on 'Guidelines for Medical Doctors Concerning Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment in Relation to Detention and Imprisonment'. The organisations of other health professionals, such as, psychiatrists, psychologists, etc, also formulated their own codes of ethics in this field at the same time. As a consequence, on December 18, 1982, the United Nations General Assembly adopted, 'Principles of Medical Ethics Relevant to the Role of Health Personnel, Particularly Physicians, in the Protection of Prisoners and Detainees Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment' (for full text of these codes see *Radical Journal of Health*, issue on Human Rights and Health, September-December 1988).

Several other organisations also carried out investigations concerning the role and problems of health professionals in relation to human rights. The Committee on Scientific Freedom and Responsibility, formed by the American Association for the Advancement of Science investigated the behaviour of health professionals in relation to the violation of human rights in Chile, South Africa, the Philippines and Uruguay. The Anti-Apartheid Movement highlighted, among, other things, the death of Steve Biko, a leader of the Black Consciousness Movement, in th[e] hands of the South African authoriti[es] and the gross negligence and collusion o[f] doctors in his death. A team of doctor[s] appointed by the British Medical Associa[-]tion compiled an informative and posi[-]tional document titled 'The Tortur[e] Report'. Doctors and forensic scientist[s] assisted numerous human rights investiga[-]tion teams to unearth and reconstruct th[e] torture and deaths of thousands of indi[-]viduals—who had 'disappeared' in Lati[n] American countries. The Chilean Medica[l] Association's (CMA) fight against th[e] fascist regime of Pinochet and the inter[-]national campaign to save the CMA'[s] office-bearers from repression made the health professionals acutely aware of thei[r] vulnerability while upholding ethical principles. The Amnesty International (AI) in its worldwide campaigns helped bring into focus the behaviour and problems of health professionals in the face of human rights violation.

These developments posed two major problems for the health professionals at the national and the international level: (1) How to prevent human rights abuse by health professionals? What is to be done to get the codes of ethics in relation to human rights implemented in various countries? How to identify and punish health professionals violating these codes? (2) How to protect health professionals who are victimised for upholding ethical principles? How to develop the necessary mechanism to express solidarity with such victims and to bring pressure on the concerned governments? That is, the health professional must be addressed to as the abuser of human rights as well as the victim of human rights violation.

A recent seminar in Paris on 'Medicine at Risk: The Health Professional as Abuser or Victim' organised by the medical division of the French section of the Amnesty International (AI) from January 19 to 21, 1989 discussed some of these issues. For the AI, this seminar was in a way a major step forward after its earlier such effort in 1978 in Athens, in which some 100 health professionals from 13 countries had discussed, 'Medical Detection and Effects of Torture, the Need for Treatment, Rehabilitation and Compensation of Torture Victims and Other Work of Medical Profession Against Violation of Human Rights'. In the Paris seminar, over 100 health professionals from more than 20 countries participated. Underdeveloped countries were represented by participants from Chile, Uruguay, Pakistan, India, South Africa (Black doctors), Sudan, Tunisia, Turkey, etc.

The seminar began with a plenary session and broke up into groups discussing one of the four topics: (1) A universal and unequivocal definition of the principles of medical ethics; (2) finding an interna-

tional cure for medicine at risk; (3) finding a cure for medicine at risk at the national level; and (4) ethics, education and information.

Defining of Ethical Principles

In the world of differing ethnic and political characteristics, each harbouring its own traditions and prejudices, to evolve universal principles of medical ethics and their unequivocal definition is a formidable task. It took nearly 40 years after the Nazi genocide to develop and get accepted the existing codes of ethics related to human rights by the international organisations of health professionals and the United Nations. Now the task is to make them more meaningful and precise so that they can encompass numerous and specific situations in various and possibly in all countries. Therefore, the aim of the participants was to identify relevant issues and to develop, wherever possible, consensus, through organised discussion on certain contentious issues, so that some advances could be achieved.

A major debate took place on the Islamic Code of Medical Ethics. The Declaration of Kuwait (January 1981) on the subject was circulated as background document for the seminar. The problem with this declaration, as some participants pointed out, is the same as most of the codes of ethics devised at national level. Such codes are worded in a manner that does not go grossly contradict the 'universal principles' of medical ethics. However, they remain silent on the customary and the state-sponsored practices which are violative of human rights. For instance, in the Islamic countries, the so-called Islamic punishments such as, flogging, stoning, amputation, etc, are given official sanction by custom, religion and the state power.

The Declaration of Kuwait satisfies 'universal principles' by stating that "the physician shall not permit any of his special knowledge to be used to harm, destroy or inflict damage on the body, mind or spirit, whatever the military or political issues". However its interpretation and definition in the context of the concrete situation prevalent in Islamic countries is kept, to say the least, ambiguous. That is, it does not specifically forbid health professionals from participating in any way in the Islamic punishments.

Some participants on the other hand argued that the Islamic code is a comprehensive document and it is concerned with all aspects of Islamic society. Secondly, according to them, under genuine Islamic laws, these Islamic punishments cannot be passed indiscriminately. There are severe restrictions and conditions to be fulfilled before an individual can be subjected to such punishment. In the light of these arguments it should be noted that the Declaration of Kuwait, despite its liberal use of religious terminologies and invocation of god in every paragraph, does cover the doctor's duties and rights in many aspects of health care, including preventive and promotive aspects. But the coverage does not justify the content. The point is, if the general principle forbids a doctor to use his or her special knowledge to harm, destroy or inflict any damage on the body, mind or spirit, it cannot under any stretch of the imagination allow the doctor to be a party to or assist in the execution of any Islamic punishment, irrespective of whether such punishment has fulfilled all Islamic criteria or not. Therefore, as some participants strongly felt, the general principle should be defined in the context of the concrete situation in the Islamic country by specifically opposing Islamic punishments. One participant argued that in such interpretation the religious sentiments should not come in the way and in any case, historically, these punishments are not strictly and specifically Islamic in the sense that they existed even much before Islam was born.

Some participants from underdeveloped world criticised the western countries for not taking a very firm stand on this issue. One participant criticised the BMA's 'Torture Report' wherein the issue of a doctor administering anaesthesia before the amputation of hands of the prisoner is kept open under the plea that such action would at least help minimise the pain suffered by the prisoner.

Despite heated debate in the group meeting, during the plenary session it become clear that since the majority was not ready to force the issue, no concrete and unequivocal interpretation would emerge. Ultimately, the consensus remained universal but not concrete and equivocal for it was simply agreed that the health professional should not participate in the corporal as well as capital punishments.

Two other important issues which were not so controversial also came up for discussion. The first was the doctor's role in the forced feeding of hunger strikers. In general, the participants agreed that the health professionals should never participate in the forced feeding and no authority must force the doctor to force-feed the hunger striker. The second issue was regarding the independence of health professionals from the authorities. That is, health professionals must have the right to uphold their professional ethics when the rules of authority conflict with these ethics. Such a right could well be exercised only when they have real independence from public authorities and penal institutions. It was felt that organisations of health professionals should actively strive

for such independence of the health personnels.

International Cure for Medicine at Risk

Experience shows that international remedies are useful in stopping the use of medicine in violation of human rights and to help health professionals under arrest or facing difficulties due to their resistance to such use of medicine. Several international campaigns and other actions carried out in the past were briefly reviewed and it was felt that more could be done in this respect. For such collective endeavour, it is essential to upgrade and disseminate information on opportunities for international action. In this context, some participants felt that there is a need to improve liaison between governments and between non-government organisations (NGOs). The medical NGOs have an important responsibility in playing an active role in the international efforts. Here too it was felt that for all such actions to survive and be effective at the national as well as international level, the independence of the health professionals and their organisations from the governmental authorities is a necessary pre-condition.

While reviewing past actions it emerged that visits by international teams to the detention centres are having a positive impact in improving the situation. Therefore, it is necessary that such efforts are continued and to make them more effective two suggestions were made. Firstly, such effort should not get restricted to a few countries; our aim should be to cover as many countries as possible and its regularity should make it a universal system. Secondly, we should create conditions so that we are able to organise such visits any time to any detention centre in the world.

Punishment to the torturer cannot be left to the country's government and law. Our reference point should be the international law under which torture is a crime. Thus our campaign should uncompromisingly demand severe punishment to the torturer. The health professionals and their organisations at the national level should not merely wait for the governmental and legal actions. They should also impose professional punishment on the health professional who colludes in any way in the torture. Similarly torture linked to medical and other scientific experimentation is also outlawed by the UN covenant. Further, it was felt that we should pay more attention to train health professionals to equip them to diagnose and treat torture victims. Such training should help in bringing more cases of torture to light and make known the information on who participated in such cruelty.

For organising international actions and campaigns, it is necessary that information is received from countries concerned. Further, the health professionals would know where to send information and specific complaints. Thus, there is an urgent need to set up some international mechanism to receive complaints from individual countries, disseminate them as widely as possible and to organise necessary action. The participants decided that the World Health Organisation (WHO) should be approached and persuaded to undertake responsibility to set up such a mechanism to process complaints at the international level.

Some issues of immediate concern in certain countries were also raised. The situation in Turkey was discussed and it was decided that some representation to the Turkish authorities should be made through the World Medical Association (WMA). The situation in Algeria also came up for discussion. However, the issue that generated heated debate and led to sharp exchanges was the doctors' collusion in torture in South Africa. This was an important issue which once raised in this group meeting kept on generating passionate debate till the seminar ended.

National Cure for Medicine at Risk

Whatever may be the usefulness of international actions, they cannot substitute the need for concerted action at the national level, to rescue medicine from the risk of human rights violation. Further, international actions are more effective if they come in addition to the actions at national level. Moreover, international advances in ethics would come to naught if we fail to translate them in actual practice at the national level. Indeed there is a wide gap between the international principles and their implementation at the national level, more so in the underdeveloped countries. In fact, the underdeveloped countries, where medicine is at the greatest risk, are yet to incorporate these principles in their legal systems and in their official codes of medical ethics.

Since these ethical principles go against the state's tendency to inflict torture, at the national level they can be upheld in the best manner provided there are strong local and national organisations of health professionals working independent of government controls. The talk of medical ethics related to human rights perhaps may not have desired effect on the health professionals if the code of ethics related to medical and health care practices is not strictly followed and implemented by these organisations. Further, for general democratic environment in the organisation freedom of information is a must. In addition, the health personnel should be adequately educated and trained to diagnose and treat torture victims. The organisations of health professionals at the national level should incorporate codes related to human rights, establish severe penalties to punish their violators and also devise necessary mechanism/machinery to efficiently implement such penalties on the erring members.

The group discussing this topic also made very significant contribution by devising certain objective criteria for suspecting human rights violation in the prison. In all, the group could put together seven criteria, the existence and occurrence of any one of which should raise suspicion on possible human rights violation in any prison anywhere in the world. Not only that, these criteria could become important indicators for evaluating and judging the penal system of individual country from the perspective of human rights. These criteria are listed below:

(1) The standard of health care inside and outside the prison should be uniform. Any indication that health care available inside the prison is substandard should raise suspicion that the prisoner's human rights are being violated. On this criteria we should add certain reservation of our own. In the countries where inequalities in health care are very sharp and extreme, as is the case in most underdeveloped countries, it would become very difficult to talk about uniformity inside and outside the prison. The problem might be solved by talking about the average standard of health care prevalent outside the prison being made available to the prisoners. But the averaging of standard of health care itself would create lots of practical and ethical problems. This criteria needs to be concretised further.

(2) In every prison there should be strict regulation for conducting autopsy (postmortem) on every death in the prison, whether natural or otherwise. Any death in the prison not followed by autopsy should indicate the possibility of human rights violation.

(3) The autopsy of such death should be conducted by an independent doctor, i e, the doctor not in the employment of penal institution.

(4) Certification of death in the prison must be by an independent doctor. If the death certificate is issued only by the establishment doctor, one should suspect human rights violation.

(5) The prisoner should have absolute right to consult a doctor without requiring even the presence of the establishment staff.

(6) At the time of the doctor/health professional and the prisoner encounter, if the health professional is unable to identify himself or herself, and conversely, if the full identity of the prisoner is not disclosed to the health professional, one should strongly suspect human rights violation.

(7) There is a very high potentiality of

abuse in research and experimentation on prisoners. While research and experimentation can be conducted in the prison, ethical provision of full informed consent must be strictly implemented and the burden of proof of the ethicality should be solely on the authorities.

ETHICS, EDUCATION AND INFORMATION

The group discussing this topic dealt with the issue of human rights and ethics in minute details. It was asserted that the human body and mind must not be violated under any condition, for any purpose and by any individual or authority. Any penalty or situation which violates human body and mind must be unacceptable. Thus, ethics should be understood in the broadest perspective and should be a concern of not only health professionals but of all in the society. The enforcement of ethics should be a task shared by everybody in society.

Beginning from such idealist and all encompassing premise, it was natural that issues from death penalty and corporal punishment to debt trap were raised. One participant even contended that when we are against all terrors, the debt burden of the third world countries acting as an international terror mechanism could not be ignored.

Death penalty which was discussed in another group where the consensus had emerged that a doctor should not examine victim's body to issue death certificate until several hours after the execution had been carried out, came up for discussion in this session too but from a different angle. In this group it was agreed that health professionals should not participate in any way and in any capacity in the capital punishment of any type. The group went beyond that by stating that we should not remain a passive non-participant but also involve all others, namely, the maker of rope for hanging, makers of electric chair, etc. That is we should actively strive for the acceptance of our opposition to death penalty and torture by everybody in the society. In short, we should treat our ethical principles in an active way for getting them accepted in the society as a whole rather than just confining to our profession.

Not only that, human rights and ethics cannot be confined to 'exceptional' cases of torture and death penalty, but should encompass day-to-day ordinary cases of human rights violation. For, such cases form the real bulk of cases and they have not received sufficient attention. For instance, use of coercion in family planning programme or denial of medical care to an individual who is not able to pay, etc, are day-to-day violation of human rights in health.

How can the health professionals be educated and trained on the human rights issue? Many suggestions were made: (1) The study of ethics and human rights should be introduced from the first year of training in the medical and nursing schools; (2) The Tokyo Declaration, the UN principles of ethics, etc, should be used for teaching human rights; (3) The trainees should be imparted adequate skills to diagnose and manage torture cases. For this purpose, lectures, discussions and case presentations should be organised; (4) In refresher courses and continuous training, human rights and skills to manage victims should be incorporated; (5) The associations of health professionals should educate their members about human rights and train the trainers; and (6) People should be informed about the type of education and training given to doctors so that they can set up expectations and thus reinforce training.

CONTROVERSY ON SOUTH AFRICA

Sometimes a small incident tells us more about the individuals and organisations concerned than the long drawn sophisticated discourse. Something similar happened in this seminar and it served as an eye opener to many participants. In the group discussion, 'International Cure for Medicine at Risk', issues regarding the current situation in many countries were discussed. Here, the participant from Turkey mentioned reports on doctors' collusion in torture in South Africa. There are two medical associations in South Africa. The Medical Association of South Africa (MASA) is the oldest and it has dragged its feet over supporting the fight against apartheid. In 1982, after the MASA failed to properly investigate and punish doctors involved in the murder of Steve Biko, the anti-apartheid doctors formed a separate association called the National Medical and Dental Association (NAMDA). Due to concerted efforts by the NAMDA, an increasing number of cases pointing to doctors' collusion in torture in South Africa have been brought to light. The MASA has, of course, consistently denied that its members are participating in torture.

In this seminar, the secretary general (SG) of the World Medical Association (WMA) participated in this group. In fact he had earlier agreed that the WMA would make a representation to the Turkish authorities on the question of human rights violation and doctors in Turkey. However, he felt most upset when

the question of South Africa was raised. For, the WMA is already facing a rough time over its association with the MASA. After the MASA was readmitted to the WMA a few years back, the WMA has come under increasing criticism. To this was added a new rule which gives the member national medical association of the WMA votes in proportion to its membership. This rule has replaced the earlier one country, one vote system. As a result many countries have withdrawn from the WMA. Currently, the WMA has a membership of associations from only 42 countries. From western Europe, only the French and German medical associations have still maintained their membership. The Indian Medical Association has also withdrawn from the WMA. Against this background, when MASA was criticised and the WMA was taken to task for not enforcing its own declaration on the MASA, it was natural that the SG of WMA reacted in a very hostile way. Fuel was added to the fire when the Turkish participant converted his submission into a resolution on South Africa for discussion in the seminar. The issue, of course, could not be resolved in the group discussion and so came up for discussion in the plenary.

This must have irked the SG more. For he reacted very angrily. In the plenary, initially he opposed any discussion on the issue. However, in response, one participant strongly objected to this suggestion of not discussing the resolution and said that it would be in gross violation of the democratic rights of the participants. The SG of WMA in turn issued a threat by saying that if the resolution was accepted, he and the WMA would dissociate completely from the proceedings of the seminar as the resolution criticised the WMA. He also challenged the mover of the resolution to prove with documentary evidence that MASA members were colluding in torture. While most participants deplored the threatening attitude of the WMA, on the challenge to prove 'allegations' there were some difficulties. First of all many participants found it shocking that they were asked to 'prove' something that should be obvious given the situation in South Africa. Secondly, it was clear that the challenge was directed at the black doctors who are members of NAMDA and were participants in the seminar. This was done knowing that the emergency laws in South Africa forbid the black people to divulge information about the domestic situation to the outside world. That is, if the South African participants were to open their mouth to substantiate 'allegations', they would face criminal charges and immediate arrest on their return home. In spite of these difficulties, it was proposed to the SG of WMA that if WMA was ready to provide protection through its good office in the MASA, a case-by-case report with names, places and dates could be openly provided in the seminar. The WMA, however, was not interested in doing any such thing.

At this juncture a representative of the Amnesty International (AI) intervened. He contended that on this issue sufficient documentation was not available. Secondly the AI's mandate is to deal with individual cases while the country-specific resolution cannot be accommodated in it. Thirdly, the AI does not sign any statement or resolution along with any other organisation or individual. That is, the AI always issues a statement of its own but never in association with others. From this standpoint he tried to persuade the supporters of the resolution not to press for its acceptance in the seminar.

After this debate on the second day the discussion was cut short due to lack of time and it was decided that the issue would be decided upon on the last day. However, later on the participants came to know that the last day plenary was an open meeting which would make it difficult to discuss contentious issues. This situation really disappointed supporters of the resolution. They however continued to press for its acceptance in the evening in informal discussions. Ultimately a consensus emerged that the resolution would not be placed for voting in the seminar but could be retained with an explanation by the WMA for the signature of participants who wanted to support it.

In the meanwhile two more participants had put their names as movers of the resolution. The final resolution that was signed by large number of participants read as under:

> Instances have been illustrated where doctors are either passively or actively involved in torture and degrading or inhuman treatment or punishment in South Africa. In light of the above, we, the undersigned participants of the seminar, resolve and call upon:
>
> —All NGOs, including WMA of which the MASA is a member to implement the Declaration of Tokyo and other related declarations on human rights with regard to its membership in WMA.
>
> In addition, we call upon
>
> —All governmental organisations to actively address this problem and sanction South African doctors involved either implicitly or actively in the maltreatment of detainees.
>
> We propose that an appropriate body be requested to monitor torture and participation actively or passively by medical doctors in South Africa.
>
> Resolution moved by: Umit Kartoglu, MD, Turkish Medical Association, Turkey; Amar Jesani, MBBS, Medico Friend Circle (Bombay), India; Mahboob Mehdi, MBBS, Voice Against Torture, Pakistan.

This controversy on South Africa and the failure to allow the resolution to be voted upon in the seminar brought to light many uneasy questions which such international gatherings will have to resolve in future. One of them is the vulnerability of participants from the underdeveloped countries. At home they face a particularly oppressive, dictatorial and even apartheid or fascist state. At best, they have very weak democratic governments. Thus, their need to receive international support for long-term survival in their fight for human rights is the greatest. In this situation when they face an international gathering on human rights participants who do not have a strong will and need to take positions on the contentious issues, they become doubly vulnerable. In my personal discussion with the participants from such countries I was particularly struck by the fact that they were over-cautious about alienating international groups which are providing them support through international campaigns.

Another important limitation of this seminar was the almost complete lack of discussion on women's issue. Not that women were not present in the seminar. In fact almost half of the participants were women. In addition, some of the central organisers of the seminar from the French section of the AI were women. Yet, not a single co-ordinator of the group discussion and the presidium of the plenaries had representation from women. Further, in one of the background papers circulated by an Egyptian participant, there was a derogatory reference to women and when it was brought to the notice of the participants in the group discussion, no discussion ensued. This particular passage in the paper stated that "For every individual in the Islamic state, the government should provide: suitable house, clothing for summer and winter, wife to satisfy his desire, social and medical care"

Despite these limitations, the seminar was another step forward in the international effort to stop the use of medicine in human rights violation. It is indeed necessary that these ethical advances are implemented at the national level both to prevent the health professional falling a prey to the ideology and actions of repression and to protect those who are fighting against the violation of human rights.

In our country the participation and specific medical input in the human rights efforts by health professionals is very negligible. Given the manifold rise in instances of human rights violation and even the victimisation and killing of doctors upholding human rights, the need for progressive health professionals and human rights organisations to come closer on this issue is becoming urgent.

Glamour Abroad, Troubles at Home

Babar Ali

Benazir Bhutto gives the impression of having been bowled over by the receptions she has got in China, Turkey and the US. But foreign tours rarely help avoid dealing with the real problems at home. As if to drive home the point, the day Benazir left on her US trip, the opposition parties got their act together and formed a Combined Opposition Parties group against the government.

IF the American people were part of the Pakistani electorate, Benazir Bhutto could have become prime minister of Pakistan for life. She has been presented to the American people, at times as a glamorous woman of the east and a sex symbol, and at others as a very brave woman who fought against severe odds, was incarcerated, lost members of her family and eventually won the hard-fought battle against tyranny and oppression and emerged as the leader and torch-bearer of democracy in Pakistan. The reception she got on her recent tour to the United States was indeed historic and the US media went out of its way to dazzle the American public with this daughter of the east. The US government was charmed by her eloquent address to the Congress. President Bush must have been amused when he was told by Benazir Bhutto that both of them were born under the same astrological sign, and given the adherence of the most recent ex-president of the US to his daily star chart, both Bush and Benazir would have gotten along like a pair of twins, knowing and understanding why the other was behaving and feeling in such a way. The tour was an unparalleled success. She has even set the stage for a designer *gharara* and *shalwar kameez* revolution amongst the glitterati of the United States.

Sixty F-16s have been ordered by Pakistan along with other military hardware. Economic 'aid' has been approved and attempts by the US government to help Pakistan rescue its economy, and thus the government of Benazir, are to be given priority. US business concerns have been given all sorts of guarantees and have been encouraged to come and invest in Pakistan. "An identity of views" have been found on the troublesome Afghan question, where both parties want Najib and his government ousted, to be replaced by a "government of the people" to be elected by the people. The controversial nuclear issue seems to have been discussed in the open for the first time and reassurances by Benazir seem to have hit the mark and there now seems to be some belief amongst US policy-makers that indeed Pakistan does not have grand designs of building nuclear weapons and intends to use nuclear technology for "peaceful purposes". This belief and confidence in Pakistan's nuclear programme is an important stepping stone to more confidence and thus more aid, assistance and goodwill. Indeed, Benazir has made a mark on the US people and on their government. But foreign tours rarely help avoid dealing with the real problems at home. Benazir should have learnt that from Rajiv Gandhi.

The day she left for her US trip this year—her third major foreign tour in six months, along with a few smaller pit-stops—the opposition parties got their act together and formed a Combined Opposition Parties group with seven parliamentary parties united against the government. (Of the seven, the largest, the IJI consists of nine parties, some of which do not have a representative in parliament.) The COP is a collection of parties with little ideological coherency amongst the different groups and the only thing which unites them is the fact that they are not in government at the federal level. The COP claims that it has at best a handful of seats less than the People's Party and could, after some lobbying, be in a position to topple the government, although for some very strange reason, the spokesmen of the COP have been saying that it has not been formed to topple the government but to act as a pressure group. One assumes that politicians are in politics to assume power.

The main reason for this pressure-group nonsense could be that the third biggest party in the National Assembly after the People's Party and the IJI, the Mohajir Qaumi Movement (MQM), the Karachi and Hyderabad based chauvinistic organisation, is not part of the COP. The MQM has 12 seats from Karachi and 2 from Hyderabad, a city 160 km from Karachi. In the provincial assembly in Sindh, the MQM has 31 seats to the People's Party's 68 and the two have worked together in government in the province. The MQM and the PPP have had a rough and troublesome liaison in Sindh, thanks mainly to the Sindhi-Mohajir ethnic divide where the PPP represents only the Sindhis and the MQM the Mohajirs of Sindh. The Sindhi-Mohajir strife, now a routine affair in Sindh, has had major consequences on the relationship between the two parties. Nevertheless, for the moment at least, the MQM has decided not to join forces with the IJI and become the most important member of COP. If it does indeed join, Benazir should be prepared to face an uncertain future.

The province of Sindh from where the People's Party derives its greatest strength is also the most troublesome region for the PPP. The ethnic divide has grown wider and the law and order situation in this province has deteriorated. Dacoities and kidnappings have become a common occurrence, and as unemployment has grown, resentment amongst the people who elected the People's Party has also increased. Extremist nationalists within the People's Party are clamouring for a harder line against the Mohajirs and against the MQM. Indeed, the economy and the political situation in Sindh are causing great worries to the Benazir government. An attempt to appease the Sindhi nationalist lobby in her party means annoying her main ally in Sindh and the centre, the MQM. Attempts to 'bridge' the ethnic divide means that a large disgruntled section of her party looks towards the Sindhi nationalist groups in the province, weakening the position of the People's Party. One does not envy Benazir; against a few moments of glamour on the American screen, there are severe and serious problems confronting her constantly.

The latest addition to her problems is the imminent fall of the PPP government in the province still called the North West Frontier Province (NWFP), now that the once progressive Awami National Party has decided to join the Combined Opposition Parties at the federal level and the Islami Jamhoori Ittehad at the provincial level. With some wheeling and dealing, the People's Party could be out of office in the province. If this move succeeds, three of the four provinces will be governed by non-People's Party governments and the fourth, Sindh, is so strife-ridden that it has no effective government in the first place.

The result of these new alliances and moves means that the People's Party will begin to be reduced to a provincial power and the country will become even more ungovernable. If the COP pressurises the PPP, there is a possibility that one could see a mid-term election by mid-1990 and given the fast moving changes on the political canvas in Pakistan, the likely possibility would be a further weakened People's Party government in Islamabad, with nationalist trends getting transformed into electoral seats in the provinces.

Pakistan is an extremely difficult country to govern and Benazir must confront major issues more boldly and maturely if she is to stay in power. At times one gets the feeling that she is not doing so and has been smitten by the receptions she has got in China, Turkey and the US. She will have to give Pakistan more time and interest in order to ensure her own survival.

Feminists, Women's Movement, and the Working Class

Ilina Sen

It is only right that we constantly question the form and content of women's organisations and the directions the women's movement is taking. But when the process of rational questioning is suspended and distrust substituted in its place the result is not merely confining, it is misleading as well.

ABOUT a year ago, a document titled *Feminists and Women's Movement* authored by Vimal Ranadive and published by the All India Democratic Women's Association (AIDWA), became available to the reading public. Because Vimal Ranadive is known to have been working in the cause of women's rights for a long time, and since AIDWA is a federation with a large base of working women, one expected that the document would explore and comment on the relationship between the working class movement and the women's movement.

Having gone through the document however, one is bound to admit that one is disappointed. For not only has the author not recognised the positive aspects of the relationship between the working class and the women's movements, she has chosen to focus almost entirely on feminism's 'destructive' potential. Her presentation contains so much obvious prejudice and betrays such distrust and fear that some of the valid questions she raises—about the role of funding in women's organisations for example—lose their impact. The women's movement, at least in our country, is new. The dangers and pitfalls facing it are many. It is only right that we question the form and content of women's organisation constantly. But when the process of rational questioning is suspended, and distrust substituted in its place the result is not merely confusing; it is misleading as well.

Ranadive's main arguments are as follows:

(1) In the nineteenth and early twentieth centuries, women in Europe, Britain and America faced blatant discrimination in wages, employment, and received unequal treatment in several spheres. The feminists of this period justifiably fought for rights to education and the vote, for equality under law in matters of marriage, property rights and child custody. Feminists of this period turned the edge of their attack against the policies of discrimination of capitalist society which wanted to utilise women's cheap labour while denying them their rights. While the demands of the feminists were justified in those times, they are today directed against men and hence are uncalled for. It is of course perfectly true that the demands for women's equality were first articulated in a modern context in Europe and America in the aftermath of the general democratic currents raised in society in the aftermath of the industrial revolution. Western women in the late 19th and early 20th centuries fought for the vote, for the right to legal equality and education. The constitutional equality that Indian women (and women in many other countries) today enjoy is the result of the struggles waged by these women. The constitutional guarantees that women in socialist countries enjoy also originate from these struggles, and many of the early socialists were also strong fighters for women's rights and saw the two struggles as linked. The names of Engels, Bebel and Zetkin come most obviously to mind in this context, but there were many others.

At the same time not all those who fought in the cause of women's rights were necessarily socialists. The liberal feminist current was strong in the England of 1880 and subsequent years, and middle class women agitated for higher education, the vote, legal changes and birth control. The women from the Pankhurst family—Sylvia, her mother and sister—Marie Stopes and Margaret Sanger were among those in the vanguard of this movement, and the issues these women raised could not be ignored by the socialists. The extent and nature of the interaction between feminists and the various socialist groups affected both. Sylvia Pankhurst in a later phase attempted to link up women's issues with those of the working class and was rejected in the process by her family and many of her former comrades.

While this long history has helped to achieve in practice many of the demands of women for equality in liberal democratic and socialist political structures, can the same be said for the situation in our own country? Is it not true that in our country these rights exist often only in name? Do women have here, in practice, equal access to education? Do personal laws for women in different communities see them as equal under law? Is it not true that for the majority community in our country the natural guardian of the child is assumed to be the father? And as for exploitation of cheap labour, is it not true that women's paid work in agriculture and most sectors of unorganised industry (where over 80 per cent of 'working' women toil) is undervalued, and that sex-based wage discrimination is rampant? What then is Ranadive saying? Is she saying that it is unreasonable to struggle against such discrimination? These are the issues feminists in India are taking up, and precisely such struggles she finds justifiable in the west in a historical context. Or does she say that these struggles are not justified outside the sphere of left and trade union politics? In which case one can ask whether these structures have breadth and depth enough to take these issues up fully, or if not, whether one should ask Indian women to shelve their demands until such time as left structures are capable of shouldering the complete responsibility for voicing them?

Patriarchal Dominance

(2) Ranadive says that feminists today, while they have differences among themselves, are united in attributing the exploitation of women to patriarchy. This, she goes on to explain, means that unless women fight men, they will not achieve emancipation.

It is true that feminists today have many differences among themselves. What they do have in common however is a commitment to equality and social justice for women. The analysis of patriarchy and the structures of patriarchal dominance has developed through feminist practice, but once again details and precise positions vary depending on positions the feminists take *vis-a-vis* the rest of society. To define it as 'fighting men' is both malicious and ridiculous and hardly befits the author's attempts to be taken seriously. As a matter of fact here, and elsewhere in the document Ranadive shows her extreme discomfort with the term 'feminist' and appears to interpret it in an oversimplified way to mean radical feminists only. At least in India radical feminists are a minority.

(3) Feminists are synonymous with action groups who work among backward sections of women with the idea of disrupting the left and the organised women's movement.

It is true that many 'action groups' are today working among backward sections of the population. Many of them began with religious affiliation or as charitable organisations and developed through their experience and acquired a gradual understanding of the structural reasons for social injustice. Many of them were and are funded by foreign donor agencies, and from what one knows of the ways of Uncle Sam, it is quite possible that some are bolstered to play the proverbial destabilising role. The scale of their operations is, however, often of laughable proportions before the might of the Indian state. What often brings these groups into conflict with the organised left is not that

they are working in the interests of the ruling class, but that many of them, while they use a Marxist methodology and analysis, remain for historical reasons outside the party fold. Class action launched by such groups from non-party platforms challenges the hegemony that the organised left feels it has in these areas, and the result is often confrontation and hostility between the official left and the 'pretenders'. To come back to the question of feminists and action groups, there are, of course, many action groups which do no work on women, and many feminists outside of action groups. It is true, however, that small non-party groups are often more supportive of work with women. This is both because the groups' small size enables them to be more open and flexible than large monolithic structures, and also because women activists in such groups often push for and achieve a distinct space for their work with women. Such actions often pose further problems for the left, for the official left is often structurally unable to adapt to these newer issues and can only respond by branding them as heresy and proclaim that such actions are launched with an idea of disrupting the left, etc, etc... more or less exactly on the lines of Ranadive!

(4) Ranadive accuses the feminists of being critical and distrustful of left parties and trade unions, and especially of being critical of patriarchy in these organisations.

The official left's hostility to the articulation of women's issues from independent platforms has been commented on above. Feminists, including socialist feminists do sometimes respond with counter hostility. Once again the practice of left parties and trade unions provided them with ready ammunition. For, the uncomfortable fact is that for many years left parties and trade unions have ignored and suppressed the women's question and assigned a peripheral role to women activists. These structures have thus become open to charges of patriarchy. It must not be forgotten that the promises of socialism extends to women as much as to men and that women have just as many expectations from socialist liberation as men do. Hence the criticism levelled at left formations by women and women's groups should not be regarded as disruption but rather as the anger born of disappointment and frustration.

On Autonomous Organisations

(5) Ranadive is critical of the feminist demand that women should organise independently, that their organisations should be autonomous, and that decision making in such organisations should be in women's hands.

The issue of the 'autonomy' or otherwise of the women's movement and of women's organisations is an old one. It dates back to the early days of both socialism and feminism. Revolutionary theory has had a strange dichotomous position on this, and this is nowhere more clearly illustrated than in Lenin's famous interview with Clara Zetkin. For, Lenin says at one point, "Our ideological conceptions give rise to principles of organisation. No special organisation for women. A woman communist is a member of the party just as a man communist with equal rights and duties." But more or less in the next breath he adds "The unpolitical, unsocial, backward psychology of ... (women)..., their isolated spheres of activity, these are facts. It would be absurd to overlook them. We need appropriate bodies to carry out work among women, special methods of agitation and forms of organisation. That is not feminism, that is practical revolutionary expediency." This illustrates beautifully both the fear and the felt need of separate forms of organisation for women. These two trends have continued to guide the thinking of left organisations on the women's question, and have stunted the growth of political work with women from a class perspective. Decisions on how far to take or not to take the women's question at any particular time have been taken in accordance with 'larger' considerations.

Socialist states have similarly taken extremely contradictory positions on state policy regarding women. In the Soviet Union the stress on releasing women for social production and decreasing her family responsibility in the early years of the republic contrasts with the pro-natalist policies following the devastations of the second world war. All this has meant in practice that the democratic women's movement has not proceeded smoothly in association with revolutionary politics, and that revolutionary organisations have continued to be myopic about women's issues. Part of the reason also why such organisations have continued to be dominated by men is that their half-hearted attempts to bring the masses of women into the fold of revolutionary politics have not been too successful. The demands for autonomy and independence of decision making arise from here. However, while acknowledging its historical importance and relevance, it is important to keep in mind that this can only be a principled stand. It is equally important for feminism to clarify its relationship with broader social movements and political currents. If all women took all decisions only for and by themselves, the only political solution for them would be a lesbian state, and this certainly does not form part of the vision of every feminist for a just society.

(6) Ranadive criticises feminists for making the question of women's unpaid labour in the home an issue and finds their attempts to ascribe value to it laughable. While some of them presumptiously attempt to rewrite Marxist theory to ascribe value to housework, others demand wages for housework.

Is it possible that she means this as a serious criticism? Women's exclusive responsibility with housework has been recognised as a major reason for her unequal participation in social life by all those who have put in even an iota of thought on the present situation of women. Lenin refers in his interview with Zetkin to women growing "worn out in petty, monotonous household work, their strength and time dissipated and wasted, their minds growing narrow and stale...". And, of course, the most sensitive exploration of this issue from within the socialist tradition is to be found in the writings of Alexandra Kollontai. In several places she discusses these issues, for e g, "The wife, the mother who is a worker sweats blood to fill three tasks at the same time: to give necessary working hours as her husband does, in some industry or commercial establishment, then to devote herself as well as she can to her household and then also to take care of her children. Capitalism has placed on the shoulders of the woman a burden which crushes her: it has made of her a wage worker without having lessened her cares as a housekeeper and mother. We, therefore, find the woman crushed under her triple insupportable burden, forcing from her often a swiftly smothered cry of pain..." (Kollontai, A, *Communism and the Family*, 1918, Bookmarks, London, 1984). That communism has no readymade solution to these problems is also acknowledged by Kollontai, viz, "These problems... derive from the fact that the question of motherhood is being tackled but has not yet been completely solved" (Kollontai, A, *Selected Writings*, Allison and Busby, London, 1977).

Once we accept the fact that women's exclusive and unrecognised preoccupation with housework is a problem, the next question is what our stand on this should be. Women have taken many different positions, depending on their understanding. The wages for housework position is only one of several stands on this issue. Other feminists have tried to ascribe 'value' to domestic work theoretically. Ranadive ridicules this effort, but the argument is at least worth listening

to seriously. Yet other feminists have demanded equal and joint responsibility for domestic work by domestic partners, and yet others have advocated a rejection of heterosexual family life. Feminists have all recognised the problem, and have worked towards ascribing freedom of choice and dignity to household work that is crucial for sustenance and survival.

Participation in Social Production

(7) Ranadive accuses feminists of denying the educative and liberative importance of the participation by women in large scale social production.

Given the sacramental relationship of women with housework and domestic labour, it is really an open question to what extent public productive labour liberates her and to what extent it crushes her further. Nevertheless equality of employment opportunity and access are no doubt important demands. As such it is amazing how, with the left and trade unions supposedly committed to this equality, the shrinkage in the female labour force has taken place to the extent that it has. Leaving aside for a moment all estimates of female employment in the agricultural and unorganised sectors, large scale reduction in the female workforce has taken place in independent India in mining and textiles, the traditional female-intensive industries, along with the workforce in general.

Vimal Ranadive's own writing (Ranadive, V, *Women Workers of India*, National Book Agency, 1976, chapter II 'Dwindling Job Opportunities') documents this trend. Between 1963 and 1972, the percentage of women in total employed in factories decreased from 10.36 to 8.73. Jhabvala has shown how women's retrenchment in the Ahmedabad textile industry was preceded by an agreement in 1933 (to which the majority trade union was party) which stipulated that the unemployment resulting from rationalisation would selectively apply to married women whose husbands are benefited by the rationalisation process. (Jhabvala, R, *Closing Doors: A Study of the Decline of Women Workers in the Textile Mills of Ahmedabad,* SETU, 1985.) Similarly it has been documented that the percentage of women workers in the entire mining sector declined from 20.1 to 11.9 between 1951 and 1971. Even today, in the captive mines of the Bhilai Steel Plant, details of the voluntary retirement scheme are circulated to women workers by the recognised union which is affiliated to the AITUC. If equal participation in public productive labour is liberating for women, what is one to make of a left trade union's stand on this? On the other hand, much of the defence of women's rights to paid employment has come from non-party women activists, the feminists.

(8) Another point that is raised is that feminists ignore the major advances made by women in socialist countries. Feminists also ignore major enemies like imperialism and the danger of war.

Not only women, but all people in socialist countries have achieved major advances and tremendous improvement in their levels of living. If feminists or the upholders of any other cause negate this, it is of course incorrect. However, socialist countries have by no means solved all the problems in the way of awakening humankind to a truly liberated existence. They are themselves trying out new strategies. In the past, self-righteous dogmatism has led to tremendous human misery and oppression in several socialist states, and if it is not constructive to ignore positive developments, it is not constructive either to eulogise the socialist states as paradise on earth. And since the democratic duty of the women's movement is to struggle for women's rights, one should not fault it or feminists for criticising the socialist states if they feel the socialist states have fallen short of expectations on the women's question.

Imperialism and war are today major dangers facing humankind and its survival. Not only feminists but all people should fight these trends but the platform of the women's movement is meant to fight women's oppression, and even if feminists confine their struggles to women's issues from this platform, nothing is seriously wrong. There can be other organisations to oppose imperialism and war, which feminists may join or support. Can one fault the feminists for taking their own work seriously?

(9) Ranadive contradicts herself when she says on the one hand that feminists are not willing to join united fronts of toiling people and they raise issues of the relationship of the women's movement to wider revolutionary politics, and on the other hand accuses them of trying to disrupt organisations like CITU and AIDWA by entering them and subsequently trying to subvert their work. Contrary to what Ranadive says women from many walks of life and from several organisations did take part in mass movements like the anti-price rise agitation. Mutual wariness between feminist and class organisations is, of course, very much there, for all kinds of reasons, which we have been discussing above. Ranadive goes on to add that feminist groups like the ones based in Bombay and Delhi limit themselves to taking up individual cases of women in distress and discourage mass action and politicisation of these issues. This allegation has greater substance, but one must remember that the city-based groups represent a particular type, and that they do, through legal forums and the media, achieve a different kind of political action.

(10) The coverage that the activities of the feminists receives in the media comes in for criticism next. The motives of the bourgeois press in giving such coverage are questioned, and Ranadive goes on to add that feminist magazines like *Manushi* are expensively produced, indicating access to (dubious) funds.

When we are talking of media coverage, is it not the publicity that certain issues g that is important rather than which grou gets a mention in the press? If city-base feminists have done a service to the interest of women by drawing public attention t issues like amniocentesis and uneven per sonal laws, what should our problem be wit such a situation? The questions of fundin and the 'professionalisation' of activist in tervention in the cause of women are, o course, serious issues. But the particular ex ample chosen is not a good one. *Manush* focused attention on Indian women's contri butions and struggles at a time when n other such paper existed. To deny credit t *Manushi* for this is churlish. And can on seriously criticise *Manushi* for being well produced, for doing its job well? It mus have had to do this on a thin budget and th Hindi edition of *Manushi* has had to clos down for financial reasons.

(11) And finally one is puzzled at the wa Chhaya Datar has been personally single out for attack as a (deviant) feminis theorist. The last two decades have seen i India a large body of theoretical and em pirical writing on the women's question. Chhaya Datar has been one of the many such writers, and one may agree with some of her positions and disagree with others. But she is certainly entitled to develop her arguments just as her writing is open to discussion and debate, in the context of the debates going on today on the women's question.

The pity is that today there is very little open debate going on these issues. What we do have is hardline attitudes, and reactions and counter-reactions. Even the present reply to Ranadive's document reads necessarily like a reaction whereas it should really have been in the spirit of a dialogue. The relationship between feminism and socialism is an old one, but the modalities are not defined on either side. The issues of family, sexual relations and organisational structures for women are important and must enter public debate. At the same time it is not possible to confine women's politics to 'the personal'. The tasks are incomplete, and both have a long way to go. Being living ideologies, both contain within themselves much variety, diversity and room for growth. The dialogue between them has as much potential for mutual enrichment, provided we are able to enter into it with honesty and openness. If this paper goes even a small way in setting such a process in motion, it would have been more than justified.

TATA STEEL

Chairman's Statement

Controls — A Retrograde Anomaly

The following is the statement of Mr. Russi Mody, Chairman of The Tata Iron and Steel Company Limited, for the year 1988-89.

The spirit of commitment and harmony, which continues to exist in the Company, has for the eighth successive year played a large part in achieving the highest ever production of 1.944 million tonnes of saleable steel during the year.

PROFITS

2. This performance has also resulted in the highest ever profits, enabling the Company, with a measure of confidence, to launch yet another programme of modernisation. To support this, the Company introduced the largest ever debenture issue in the private sector a few weeks ago and the response has been overwhelming.

PERFORMANCE

3. Performance in all the divisions of the Company was very good, with the blast furnaces improving upon the previous year. The further lowering of the coke rate achieved substantial energy savings. There was a substantial improvement in the operations of the Raw Materials Division. The Marketing Division did not lag behind and played a notable part in achieving the profits that the Company has earned. I would like to take this opportunity of bringing to your attention the outstanding performance of our Export Division, which showed a three-fold increase in turnover over the previous year, reaching a figure of Rs. 93 crores of which Rs. 10 crores were deemed exports. Our next year's target has been set at Rs. 130 crores. Whatever the Government may feel about the poor performance of Big Houses and large companies, the accusing finger can now no longer be pointed at Tata Steel. I would like to add that the time has now come for the Commerce Ministry to evolve a scheme whereby exporters of this and greater magnitude are given an incentive in the form of being permitted to retain a very small percentage of their export earnings for their own unfettered use.

TRAGEDY

4. Our happiness at these achievements is, however, marred by a tragedy the like of which we have not experienced before. You must all know of the fire that broke out on Founder's Day and which claimed 59 precious lives, largely women and children. We are doing everything possible to alleviate the sufferings of the affected families and a permanent and suitable memorial to those who have perished in the fire will be erected in the form of a Burns Unit in our medical complex. The people of Jamshedpur rose to the occasion and rendered every possible assistance, led by our magnificent medical team. This effort has been acclaimed by everyone, including the families of the sufferers. I have no doubt that Jamshedpur will carry on as usual, but it will be many, many years, if ever, before we can efface the effects of this tragedy.

SUPERSTRUCTURE

5. Your Company has launched a Rs. 1500-crore Modernisation Programme which, together with the continuing Investment Programme, over the next five to six years, will see the Company invest a total of Rs. 2600 crores in additional steel capacity, in the implementation of new technologies, additional power and a host of infrastructural facilities. It will be our endeavour throughout this massive programme of modernisation/expansion to carefully husband our financial resources so that our debt:equity ratio continues at the present very satisfactory level and the ability of the Company to pay dividends is safeguarded. Government approval in principle was received in October 1988 for increasing the saleable steel capacity from 2.1 to 2.7 million tonnes. Government's approval was also received for the import of a Blast Furnace from Portugal and the agreement with the International Finance Corporation, Washington, for DM 35 million was signed in May of this year.

DIVERSIFICATION

6. Apart from our main preoccupation with the production of more and better quality steels as also enhancing skills and training methods, your Company has been steadily pursuing a programme of diversification, which includes a new slag-based cement project now underway, and the setting up of a separate company, namely, Tata Metals and Strips Limited to roll out special quality strips in Western India. Side by side, Tata Steel's men, materials and expertise have been engaged in stabilising and turning around various associated units in which the

PERFORMANCE

	Increase
1. Gross Revenue Rs. 1861.77 crores	21.9%
2. Profit before Tax Rs. 180.34 crores	60.8%
3. Profit after Tax Rs. 154.34 crores	67.5%

Company holds a substantial interest. As regards the Kharagpur Bearings Plant, while the technical collaboration agreement with Steyr of Austria for expansion could not be implemented, an interim investment plan for increasing the Plant's capacity from 4.24 to 5.20 million numbers has been recently approved and is under implementation.

PROSPECTS

7. Confidence in the future, however, must be tempered with a measure of cautious optimism because costs are continuously rising largely due to factors beyond our control. Whilst it is appreciated that State Governments must raise resources, an over-emphasis on royalty and cess on coal for this purpose eventually puts undue pressure on the consumer of steel. Costs are also rising because of the slow implementation of policies and continuance of unnecessary controls over the pricing of steel products. India's new policy of liberalisation, launched by the Prime Minister in 1984, has been held back in many instances by vested political and other interests who do not relish change. Collectively, these interests have managed in the past, and may manage in the future, to slow down the progress of many of Rajiv Gandhi's more forward-looking policies.

HAMPERING PROGRESS

8. In the socialist world, particularly in the USSR, the loosening of State control is now equivalent to a directive principle of State policy, vigorously implemented by the top leadership. Contrariwise, in the world's largest democracy, State control over the means of production and over distribution continues to hamper our progress and it is a sad commentary on our thinking processes that socialist dogma should continue to prevail over our desire to end poverty.

ABSURDITY

9. All of you are aware of my views in regard to controls. I am not against controls if they are necessary, but controls for the sake of controls are retrograde steps in a progressive society; for instance, at the present moment – with our economy performing the way it is – there appears to be no need for most controls, except perhaps those necessitated by our depleting foreign exchange resources. Certainly, there is no need for an Iron and Steel Control. The absurdity of the present position in regard to the Iron and Steel Control can best be understood if I quote the relevant portion of the Annual Report for 1988-89 of the Department of Steel, Ministry of Steel & Mines:

Distribution of Iron & Steel

There is no statutory control on distribution of iron and steel.

There are shortages in certain categories of iron and steel material. Therefore, to ensure equitable distribution and fulfilment of supplies to important sectors, the Joint Plant Committee (JPC) have laid down broad guidelines. These guidelines apply only to production from main producers, i.e. SAIL and TISCO. The secondary producers do not have to follow the guidelines.

Pricing of Steel

There is no statutory control on the prices of iron and steel. These are determined and announced from time to time by the Joint Plant Committee, a body set up under the Iron & Steel (Control) Order, 1956. The Committee is headed by the Development Commissioner for Iron & Steel and the main producers of iron and steel, i.e. Steel Authority of India Ltd., Tata Iron & Steel Co. Ltd. and the Ministry of Railways are represented on it as members. The prices announced by this Committee are applicable only to major items of iron and steel produced by the integrated steel plants in the country. The re-rollers, mini steel plants and alloy steel producers etc. fix their own prices for their products.

10. In spite of the professed nature of decontrol over distribution and pricing, the office of the Development Commissioner for Iron and Steel continues to exert pressure in various ways to deny free market conditions to major producers. Surely one is entitled to ask whether there is control or there is no control!

DISCRIMINATION

11. There is yet another unfortunate and discriminatory aspect of the above control. The present control applies only to SAIL and Tata Steel – in other words, the main producers. All others, such as mini steel plants, re-rollers and secondary sectors have no price or distribution control. Since they constitute roughly one-third of the total steel production in India, the discriminatory nature of the Iron and Steel (Control) Order is evident.

12. At present, quite a few varieties of steel are sold at high premiums; these premiums are denied to the integrated steel plants, but are allowed freely to be garnered by the uncontrolled sector of the Industry. In other words, Government are encouraging those who provide for themselves against those who would utilise the additional resources by ploughing them back into the development of this Industry. Without, however, labouring the point, I would most sincerely urge the Government to allow the Steel Industry to run itself, for we are fully alive to our responsibilities. I feel certain that the Chairman of SAIL feels no differently – and has said so.

POSITIVE ROLE

13. These policies apart, I would like to acknowledge the help we have received from the Government of India and the State Governments. The financial institutions have played a very positive role in our affairs and, as usual, the support of the shareholders has been our greatest morale booster.

14. I must also thank the Tata Workers' Union, and all our other Unions throughout the Company's operations for their understanding of our problems and for helping us to perform better and better. The reward has been the prosperity of the Company which enables all members to share in it.

(RUSSI MODY)
Chairman

Note: This does not purport to be a record of the proceedings of the Annual General Meeting.

R.W.S. JOLL
Chief Executive Officer—India

NOTES ANNEXED TO AND FORMING PART OF ACCOUNTS AS AT MARCH 31, 1989

1. Figures of the previous year have been regrouped to the extent necessary. However, as the amounts for the current period are drawn up for seventeen months ended March 31, 1989, corresponding figures of the Profit and Loss Account for the previous year ended October 31, 1987, are not wholly comparable.

2. In accordance with the usual practice, assets and liabilities in foreign currencies, other than forward exchange contracts have been converted at the bank's year-end mid rate.

3. Premises represent Banks share of 90.60% in a jointly owned property.

4. Bills received from constituents on their behalf are controlled through memorandum registers and are recorded in financial ledgers only when collected. These bills for collection outstanding as on March 31, 1989 have however been shown in the Balance Sheet as contra under the relevant heads of account.

PARTICULARS OF REMUNERATION RELATING TO THE CHIEF EXECUTIVE OFFICER IN INDIA FOR THE PERIOD ENDED MARCH 31, 1989

	17 months period upto 31.3.1989 Rs.	Previous Year Ended 31st October, 1987 Rs.
i) Salaries	2,89,000	2,04,000
ii) Allowances	NIL	NIL
iii) Sitting Fees	NIL	NIL
iv) Bonus	NIL	NIL
v) Employer's contribution to Provident Fund, Pension Fund or any other Superannuation Fund	NIL	NIL
vi) Payments made by way of gratuities, pensions or otherwise in excess of the employer's contribution or interest thereon	NIL	NIL
vii) Estimated monetary value of any other benefit or perquisites	1,90,210	1,93,947
TOTAL	4,79,210	3,97,947

THE BANK OF NOVA SCOTIA

AUDITOR'S REPORT ON THE INDIAN BRANCH OF THE BANK OF NOVA SCOTIA UNDER SECTION 30 OF THE BANKING REGULATION ACT, 1949.

We have audited the Balance Sheet of the Indian Branch of The Bank of Nova Scotia, Incorporated with Limited Liability in Canada, as at 31st March, 1989 signed by us under reference to this report, and the relative Profit and Loss Account of the Indian Branch of the Bank for the seventeen month period ended on that date annexed thereto with the books of account maintained and produced to us at Bombay and report as under:

a) the Balance Sheet and the Profit and Loss Account have been drawn up in accordance with the provisions of Section 29 of the Banking Regulations Act, 1949, read with Section 211 of the Companies Act, 1956;

b) we have obtained all the information and explanations which to the best of our knowledge and belief were necessary for the purposes of our audit and have found them to be satisfactory;

c) the transactions during the year which have come to our notice have been in our opinion within the powers of the Indian Branch of the Bank;

d) in our opinion, proper books of account as required by law have been kept by the Branch so far as appears from our examination of these books;

e) the Accounts of the Indian Branch of the Bank dealt with by this report are in agreement with the books of account;

f) in our opinion and to the best of our information and according to the explanations given to us, the Accounts together with the notes thereon give the information required by the Companies Act, 1956 in the manner so required for Banking Companies and on such basis, give a true and fair view in the case of the Balance Sheet of the state of affairs of the Indian Branch of the Bank as at 31st March, 1989 and in the case of the Profit and Loss Account, of the profit of the Indian Branch for the seventeen month period ended on that date.

New Perspectives on Women's Work

Sujata Gothoskar

Women and Work: An Annual Review edited by Barbara A Gutck, Ann H Stromberg and Lausie Larwood; Volume 3, Sage Publications, New York, pp 291; $ 35.

RECENTLY, there has been a great deal of research and debate on the issues relating to women's work, nationally and internationally. These have encompassed a very wide range of topics—women's paid and unpaid work; discrimination against women, especially certain sections of women; women's occupational health and safety; women and trade unions, the global economy and the international sexual division of labour and so on. The book under review, a collection of 11 articles, is among the more recent contributions in this area.

The three editors have brought out two earlier volumes on 'Women and Work'. While these largely restrict themselves to women's work in the US, this third annual review, published in 1988, attempts to cover experiences and analysis from other countries. The volume features a six-chapter symposium on 'An International Perspective: Widening Our Horizons'. The 'horizons' that the editors are concerned about are multi-dimensional. First, there are national boundaries, which despite the commonalities of experiences of working women, restrict their sharing. Second is the language barriers. Third is the disproportionate emphasis on some sections of the workforce, e g, executive women, and a relative neglect of other important sections. Fourth is the boundary of particular disciplines the researchers belong to. The underlying basis of this volume is that an international multi-disciplinary perspective is likely to help us in transcending some of these limits, "reduce the isolation of our scholarship and result in more collaborative and better-informed endeavours". There is also the increasing realisation, in this volume and in many recent contributions, of global interdependence between different countries and similar trends in the movement, the impact of capital and the implications of these on women workers.

An important area that needs a place in any attempt at 'widening the horizons' is a discussion on the 'subsistence production activities' women in almost every country are involved in. These include a myriad types of work from fuel and fodder collection, walking for miles to fetch water, preparation of food, cleaning, washing, house repair, childcare, animal rearing and so on. This crucial but 'invisible' work of women is unfortunately not very visible in either this volume or in earlier ones. This is especially important when one is looking at women and work and not merely at women's unwaged work. However, this volume does include some very valuable articles. Besides, each article has at its end a very useful list of reference books, articles, etc.

Within the broad framework regarding women's work outlined above, this book includes a very wide range of articles dealing with very diverse topics, ranging from a macro perspective on women's work in the global economy by Ward to getting very close to the workplace to examine the impact of the sex composition of the workplace on friendship, romance and sex at work, by Haavio-Mannila et al. With the latter concerns is also an interesting article on the horizontal and vertical relationships between women in the workplace by O'Leary. This wide expanse itself renders a simple straightforward summary or review very difficult.

An important debate that has raged recently and which has very concrete implications relates to the entire nature of multinational corporation employment and its short- and long-term impact on women workers in different countries—whether women have experienced these as economic liberation or economic subjugation. Do jobs in the 'global assembly line' mean some control by women on their labour power and their lives or do they merely result in reshaping women's subordination? Ward argues that in the long run "women's economic dependence on these plants, men, and their families is recomposed and perpetuated through low wages, limited job stability and untransferable training", making them all the more vulnerable when multi-natioinals ultimately move out.

The case-study of Hispanic women in the electronics and garment industry in the US discussed by Fernandes Kelly and Garcia, illustrates the point further. The experience documented here is an almost universal one. The electronics and the garment industry are two sectors that have been at the forefront of internationalisation since the early 1960s. Both these share a number of features at an international level—the very low wages they offer to industrial workers, their heavy reliance on sub-contracting, the predominance of small operations hiring fewer than twenty workers, their heavy dependence on women workers. While the garments and electronics industries have been pioneers in their drive for economic restructuring aimed at lowering production costs and maintaining a competitive edge in the domestic and international markets, other industries internationally have followed suit. Other strategies industry has employed include sub-contracting, encouraging home-based production and ceaseless modernisation. These trends have given rise to a shrinking of bl[illegible] collar employment in the organised sec[illegible] an increase in the service sector an[illegible] continual increase in the informal sect[illegible]

This picture criss-crosses with another[illegible] which women workers are subject to act[illegible] discrimination in the organised sect[illegible] because they are women. In this bo[illegible] Gwartney-Gibbs while refuting the theory[illegible] women's 'rusty skills' due to discontinu[illegible] in employment, underlines that it is rat[illegible] the discrimination and the structu[illegible] characteristics of employment, such [illegible] occupational segregation, etc, that detrim[illegible] tally influence women's earnings and ca[illegible] the male-female wage-gap. Another angle[illegible] discrimination perpetuated against wom[illegible] is discussed by Larwood *et al*, in th[illegible] analysis of the 'rational bias theory'. Th[illegible] conceive of discrimination as the co[illegible] sequence of self-interested managers maki[illegible] personnel decisions concerning subordina[illegible] based on the managers' own careers rath[illegible] than on the abilities of their subordinate[illegible] Our own research in India has indicated th[illegible] discrimination against women in industry [illegible] also based on the managements' calculatio[illegible] of costs versus benefits regarding t[illegible] employment of men or women. Before pr[illegible] tective legislation was enacted and before t[illegible] union movement gathered strength, wome[illegible] were equally, if not more, attractive propos[illegible] tions for the management. Howeve[illegible] gradually the picture changed. And toda[illegible] less women are employed in the organise[illegible] sector and more women relative to men i[illegible] the unorganised or informal sector.

This is often aggravated by the situatio[illegible] of the particular nation-state as e g, the deb[illegible] crisis in Bolivia and in many other develop[illegible] ing countries in Latin America and else[illegible] where. Women are burdened with increasin[illegible] workloads and less remuneration for it du[illegible] to economic stagnation, impoverishmen[illegible] and curtailment of welfare programmes[illegible] These factors push more women into th[illegible] 'informal' economy. The pressure of th[illegible] struggle for survival itself involves wome[illegible] workers in attempts to struggle for a bette[illegible] deal. As Nash comments in her article o[illegible] women in Bolivia, as the crisis deepens, "th[illegible] class struggle has moved from the sites o[illegible] production to the household, the community, and the right to survive becomes a revolutionary issue. Women's primary responsibility for the survival of family members puts them in the vanguard of political mobilisation around these claims to live."

These motivations and compulsions that impel women workers to struggle would also lead them to work for concrete alternatives that gradually but radically change their work and life situation. These attempts would be strengthened if there are changes in the economic policies of government development agencies and voluntary organisations. One of the perspectives suggested by activists working with women

orkers is an attempt at alternative community need-based production centres of omen, which would cater to the day-to-day eeds of specific communities and would ypass the market structures that devalue vomen's labour. The suggestions in the book owever, are largely at a macro level. Ward, n her article, quotes the International Centre or Research on Women. They propose that 'governments oversee TNC employment, provide alternative training for women, and enforce protective regulations on health and safety issues. Governments also should work with other nations to avoid the bargaining that leads to runaway plants. Further, abour-intensive plants that produce for local consumption should be encouraged so that capital stays in the country. Women workers should have access to equal employment opportunity, the right to organise, and opportunities for managerial experience." The articles have outlined many other broad suggestions. These however need to be much more concretised, as the problem seems to be assuming gigantic proportions and affecting greater numbers of women.

This is true not only of women workers in the capitalist world, but almost equally true of women workers in countries like the USSR, as the article in the volume by Lapidus indicates. The article on the interaction of women's work and family roles in the USSR makes interesting reading, as a sympathetic and comprehensive picture of the situation of women workers in the USSR is not always easily available. The article emphasises that some of the most crucial issues facing women workers are indeed universal today. One of them is the persistence of the sexual division of labour in the family and the labour market, which reflects the patriarchal assumptions about what constitutes men's and women's work, and an almost stubborn refusal to redefine male and female roles. Yet, the changes are also there, however miniscule. Not only has Alexandra Biryukova been appointed to the party's secretariat, the first such high-level appointment in 25 years, but there are promises that more part-time jobs will be provided for women, that child allowances for poorer families will be increased and that partly paid maternity leave will extend to 18 months.

One of the most important aspects of women's work discussed in many countries, most often by unions, is women's commitment to paid work and women's commitment to trade unions. In the last decade, almost every union in the UK for example has a women's chapter; there are regular women workers'/unionists' conferences, and training programmes for women unionists and stewards. In their article on trade union stewards in the US, Roby and Uttal have looked at women and men stewards and how they have handled their union, family and employment responsibilities. In the US, since the founding meeting of the Coalition of Labour Union Women (CLUW), which was attended by 3,500 women unionists from all parts of the country, many changes have occurred within the trade union movement, including a shift in union membership, leadership and some policies.

Research in many countries of the west and in Asia, as well as our own experience in India suggests that "unions have had an uneven history with regard to their treatment of women". Unions have excluded or ignored women as well as fought with determination for women's rights. And in the organised sector, the union is the only institution representing workers, including women in collective bargaining for wages and working conditions. However, though unions are vital organisations for women workers, women unionists have found it difficult to maintain their active involvement in unions. Some of the difficulties reported by women unionists in Roby and Uttal's study were, "the lack of recognition of women's domestic responsibilities as evidenced by the organisation of union activities", "problems with the way the union scheduled its meetings", "lack of childcare facilities during union meetings".

Our own research in Bombay indicates that these problems inhibit women from maintaining their active involvement in the unions, which gradually become male institutions and rarely take up issues that affect or involve women members, and a vicious circle is created which causes greater exclusion of women, alienating them further from the union.

However, in many countries, and as reported by Roby and Uttal too, women workers *have* taken the first step to end this exclusion. Many concrete suggestions have been given by them. And if the present leadership is sensitive to these, a very different picture may emerge in the 1990s regarding not only women and unions, but also with regard to the entire issue of women's work.

The present book is an important contribution towards attempting to understand this picture and change it. Hence it would help women unionists as well as researchers and scholars if these volumes were available at lesser costs in paperback editions.

Approach to Pricing Policy

Ram N Lal

Pricing Policies and Price Control in Developing Countries by K D Saksena; Frances Pinter, London, 1986; pp 240.

IT is now a settled fact that justification for interference of some kind in the market mechanism exists in all countries of the world, without exception. There are obvious reasons for this. Purely capitalist or purely socialist economies nowhere exist now. They remain only conceptual models. Conditions like market imperfections; situations of unemployment; necessity of regulating the behaviour of certain strategic macro-economic variables like consumption, saving, investment, etc, to realise certain rates of growth conforming to certain pre-determined economic structure; these and many other economic and social objectives necessitate, in non-centralised economies as well, proper regulation and control of prices constantly. In other words, the question of determining the objectives, nature and magnitude of appropriate pricing policies needs to be squarely faced both in developing as well as developed countries. For developing countries the question may, of course, be considered as far more complex and serious than in developed ones. A profound treatment of this subject had hardly been witnessed earlier and in practice there have been more or less only *ad hocism* and the methods of trial and error to be reckoned with. From this point of view the present book by Saksena is a welcome addition to a very meagre stock of literature on the subject. For developing countries it is bound to serve as a guide in formulation of price control policies. A rather tricky subject has been dealt with refreshingly with a fair degree of conviction arising out of a firm grasp of pricing theory and hard core experience of struggling with the formulation and implementation of pricing policies in a vast country like India.

Do we really need a theory of price control? To what extent can economic theory by itself explain factors and compulsions which necessitate price control policies? How far can price control measures effectively deal with distortions which keep on emerging in the process of growth in the relative price structure, resource allocations and income distribution caused by market imperfections? In what way do price measures differ from other economic measures like monetary, fiscal and physical policies? What should be the degree and forms of price controls? What considerations should enter into determining the levels of controlled prices? What administrative procedures would be necessary to make price control policies effective? What lessons can be drawn from experiences of different countries in this regard? These and many other related questions have been dealt with and answered with competence in the first 10 chapters. The important topics discussed are as follows: the case for price controls and price policies; the nature and objective of pricing policies; theory of price controls; some general issues relating to pricing policies; some problems and issues relating to the determination of controlled prices; marginal cost pricing versus average cost pricing; the problem of rate of return in relation to price controlled industries; duel pricing; some aspects of price controls and pricing policies in India; and growth, performance and pricing of public enterprise in India. In the end the book draws together the main conclusions and lessons of the study which are very relevant to the policy-makers in developing countries. Thus, it covers a very wide canvas and the treatment of each topic is penetrating.

There have been attempts to develop some kind of separate theory of price control in the past. Two such theories deserve mention: (1) *Theory of Price Control* by Von Mises (1968) and (2) *A Theory of Price Control* by J K Galbraith (1980). Von Mises undertakes a stout defence of the free functioning of the market mechanism. According to him, any price fixed by the external agency at any level, other than the one determined by the free play of market forces, will finally create conditions either of excess demand or excess supply, thereby defeating the very purpose of price control and may cause the economy to slip into the vortex of more and more price controls, leading to a long chain of controls. Galbraith, on the other hand, has tried to provide an interpretation of how price controls were actually conceived of and operated in some countries during the second world war and in this process he attempted some generalisations, suggesting a framework of economic policies which need to be followed. The present author skilfully demolishes the arguments of both the above authors and concludes that there is no need to develop any separate theory of price control; nor could such a theory possibly be developed because this subject falls in the domain of policy which may be based on political ideology or value judgments.

Once it is agreed that in the modern world no economy can escape price control measures, certain specific questions come up for consideration. When should price controls be resorted to? Which commodities and at what times need they be brought under price discipline? What should be the relationship between price control measures and the measures to control production and distribution? Do price control measures, need to be supplemented and reinforced by other measures? How long should price control last? What should be the nature and form of price controls? What should be the institutional arrangements necessary for the formulation, implementation and monitoring of price control?

Answering these questions with a clear understanding of economic situations and differing institutional arrangements in itself requires great ingenuity on the part of any author. The present author however, sails through these issues smoothly and is not bogged down by the complexities of the problems posed thereby. In his attempts to do so he has tried to learn greatly from the experiences gained in the EEC and other countries. This makes the study quite impressive and useful.

In a developing country, raising resources for development poses very difficult problems and creates anxious periods in the development process. It requires a very careful balancing of monetary, fiscal, pricing and direct physical measures at each stage of development. Pricing policy in respect of goods produced by public and other enterprises may have to be viewed in relation to the taxation (positive and negative) policies of the country. On occasions it may have to be used as a proxy for taxation measures also. To what extent pricing policies of public sector enterprises should be considered as substitutes for taxation policies has been the subject of debates, because both the measures have their plus and minus points. According to the author, raising the controlled price to include a contribution to the development funds might not always be advisable. There may be cases when prices of goods have to be kept sufficiently low to make it affordable by the bulk of the consumers. He rightly feels that any exercise to fix a controlled price has to be based on a study of the industry producing the particular commodity which covers all relevant aspects such as, the regional and overall demand and supply position; the estimated gap between actual and projected production and requirements; the causes of shortages and the remedial measures necessary for their speediest possible removal so that the control can be lifted.

The question of how to calculate costs to determine controlled prices by itself is confronted with many difficult and knotty issues. The questions relate to cost-benefit analysis, freight equalisation arrangemet, marginal cost pricing versus average cost pricing, measuring rate of return (with different bases for such measurements like capital employed, net worth, turnover, output, value added, etc), determination, procurement or the levy rate under a system of dual pricing—these and many other related thorny issues are faced by the policy-makers. Each of these issues requires to be attended to carefully as there is no unique answer for any of these. The answers would depend very much upon the situation confronted with at anytime. The author has discussed these intricate issues competently.

It is difficult to disagree with the author's view that pricing policies and price control measures raise enormous, complicated issues which change their character with changing situations. In order to deal with them effectively an appropriate institutional set-up is needed, which would be required to deal with formulation, implementation, enforcement and monitoring of price control measures. Various types of price-setting and management bodies have been tried in India and elsewhere. National prices committees in France, price commission in Belgium, erstwhile price and income board in Britain, agricultural price commission and bureau of industrial costs and pricing in India may be cited as examples of these. The author has discussed at length the importance, role and functions of these institutions. He feels that apart from setting up these institutions there is a need to streamline or evolve suitable administrative procedures, both in the internal procedures governing the institutions which are engaged in formulation, implementation and enforcement of price control measures and in the procedures within the government ministries or departments concerned. According to him it is imperative to minimise the delays and reduce the level of corruption at various levels and stages of the implementation of the pricing policy and enforcement of the price control measures.

Finally, he devotes attention to the growth, performances and pricing of public enterprices in India. In this context he makes a comparative study of public sector versus private sector in respect of growth, investment, rates of growth of gross domestic product, gross and net saving and capital formation, capital employed, cost-structures, net profit, internal resources, inventories, tax revenues, etc. On the basis of these studies he arrives at certain significant conclusions which are of far-reaching significance to the policy-makers. The available evidence show that controlled prices in India have moved more or less in line with the general price level. Secondly, growth in capacity, profitability, production, capacity utilisation and resource generation in price-controlled industries have not been lower than non-price-controlled industries. These conclusions go contrary to the commonly held belief that the performance of price-controlled enterprises has a tendency to lag behind the non-price-controlled industries. These findings are of great importance to those who are in charge of economic management at the aggregated and disaggregated levels.

In concluding, the author has a message to the managers of price-controlling bodies. He feels that there is a

> need to simplify the system of statutory price-controls; build up an efficient monitoring system; abolish the multiplicity of price fixing bodies; build up a powerful consumer movement and create voluntary organisations at the grassroots level to ensure the proper functioning of public distribution system; make the entire system of price controls productivity and efficiency oriented; and adopt a conscious policy to minimise the burden of subsidies and to taper them off overtime.

Similarly, on the basis of his analysis of empirical evidence he wants the readers to realise that profitability of public enterprises (which now occupies a prominent place in the Indian economy) has been very low indeed and he has indicated several remedial measures to bring about improvement in the situation. Evolving an effective price setting system and a system of accountability at different technical and managerial levels; active demand arrangement and regular periodic review of the performance by the administrative ministries or the departments concerned may be cited as some few important measures suggested by him.

Establishing an Offshore Financial Centre in India

Proposal Revisited

S K Verghese

It is appropriate to reassess the scope and nature of India's external financial market links in the light of the major changes that have taken place in the international financial markets as well as in India's own external financial position and to see whether any change in our policy on establishing an offshore financial centre in India is called for. This paper discusses whether the recent financial market developments have made it more opportune for India to establish an offshore centre and whether the potential costs-benefits of such a centre have become more favourable today than they were in the early 80s.

THE proposal for establishing an offshore financial centre in India, which attracted considerable attention in the early 80s has been revived in recent months. Substantial changes have taken place in the international financial markets in the meantime. The external financial position of India has also altered markedly. It is therefore appropriate to reassess the scope and nature of our external financial market links to see whether a change in our policy on establishing an offshore financial centre in India is called for. The objective of this paper is to explore whether the recent financial market developments have made it more opportune for India to establish an offshore centre and also whether the potential cost-benefit of such a centre have become more favourable today than in the early 80s. Section I delimits the scope of the subject under discussion while Section II analyses the developments in the international markets that have a bearing on offshore markets. The cost-benefit aspects of an offshore centre are dealt with in Section III.

I

Nature of Financial Linkages

In order to keep the discussion on the track, it is important to be clear about the nature of the financial linkages that can be envisaged. Due to the sharp decline in the role of direct financial intermediation by banks in recent years and the growing importance of non-bank financial markets, it is appropriate to enlarge the scope of this article under the broader title "offshore financial centre" rather than "offshore banking centre", which was the focus in the early 80s.

The nature of involvement between the domestic and international markets can take the form of financial integration (some commentators refer to this type of integration in the case of India), borrowing or lending or international banking business by home country banks, or renting of geographical location for undertaking international business or a combination of these functions. The legal and institutional framework, the direct costs and benefits to the host locale and also the wider implications for the domestic economy will vary significantly depending on the exact nature of the linkages between the domestic and international financial markets.

Financial integration essentially means financial inflows and outflows between the domestic and international markets unhindered by officially imposed barriers such as exchange controls, trade controls and fiscal and monetary disincentives. Other barriers, particularly exchange rate risks, institutional rigidities, differences in maturity and credit risks, etc, may still exist. But complete freedom for financial flows between countries will increase the degree of choice for asset substitution both to resident and non-resident asset-holders. Thus, in the decision-making process of individuals and corporations, developments in foreign markets constitute an important factor in an integrated market situation. At present only a few developed countries are financially integrated. Many European countries and almost all developing countries have officially imposed restrictions on capital flows, although current account transactions are relatively free. Even Japan had shut out her financial markets until the early 80s to conserve her domestic savings for domestic investment. Even now though Japan's money markets are to a large extent integrated with the European market, the long-term financial market remains unintegrated. At the present stage of India's economic development and the highly vulnerable balance of payments position, very few will seriously recommend the integration of the domestic markets with the international markets. This position is unlikely to change in the foreseeable future. India also, for the same reason, cannot aspire to be an investor (lender) in the international markets. Thus, the nature of the inter-linkages between the Indian and international financial markets narrows to a borrower status, role as international bankers and also an offshore financial centre. However, the proposal for establishing a centre has been made mainly to provide the institutional modalities for increasing Indian "market's linkages with the international markets",[1] i e, to borrow from overseas markets and to promote international banking business.

For a realistic evaluation of the scope for establishing a financial centre and its cost-benefit to India, it is necessary to take stock of the distinguishing features of offshore centres and their performance in recent years in the context of the basic developments that have taken place in the financial markets in the 80s.

II

Developments in International Financial Markets

Distinguishing Features of Offshore Centres

There is considerable heterogeneity in the range of functions performed and the regulatory privileges enjoyed by different offshore centres. No doubt, they are part of the growing eurocurrency markets. The classification of certain centres under offshore centres is rather arbitrary. But what distinguishes an offshore centre from other eurocurrency centres is that in offshore centres the host countries have artificially created international financial business by conferring monetary and fiscal privileges.[2] Besides, the external transactions of the banks and non-bank financial units engaged in offshore business are segregated from the general books and records of participating banks, primarily for regulatory purposes and also for insulating the domestic financial markets from offshore transactions. On the other hand, major financial centres like London, New York, Paris, Switzerland and recently Tokyo have been developed spontaneously by market participants converging there to take advantage of the natural business potential. In these

centres, external financial transactions are not artificially segregated on the books and records of the offshore financial institutions. On the eurocurrency business in major euromarket centres like London, reserve requirements, withholding taxes, etc, are not imposed, similar to that of offshore centres. Though the US and Japan are natural international financial centres, because of their economic importance in the world and the use of their currency and financial markets internationally, both have established offshore centres (International Banking Facilities or IBF by the US in December 1981 and Japan offshore market or JOM in December 1986 by Japan) through special schemes conferring regulatory privileges on participating banks and financial institutions. If it had not been for the IBFs which represent a "free banking zone" international transactions denominated in the US dollar would have not qualified for exemption from reserve requirements, interest rate ceilings then in effect, deposit insurance coverage, etc. JOM was established to enable financial institutions in Japan to undertake wholesale international banking business and it has been patterned on the IBFs model.

Among the offshore centres there are two categories, viz, tax havens and regional financial centres. It is the aspiration of all offshore host countries to develop into regional financial centres but that is contingent on greater interlinkages between the host financial markets and the offshore centres, as also the availability of allied services (lawyers, accountants, international broking services, etc) and potential borrowers and lenders in the hinterland. In Singapore and Hong Kong, the two regional centres, the bulk of the offshore business is still interbank transactions. Several of the offshore centres even today are tax havens which impose zero or low rates of tax and also offer a high degree of banking and commercial secrecy. The activities of some of the tax havens, also other euromarket centres, have become more 'seedy' in recent years due to the adeptness developed by bankers, lawyers and trust company operators in 'layering' the secrecy of transactions through highly complex arrangements involving offshore banks, trust companies, subsidiaries, etc. The sophisticated facilities of offshore centres are increasingly used for laundering concealed income from fraud, tax evasion, drugs and arms trafficking and kick-backs received by politicians and administrators. After extensive investigations, a staff study by the United States senate permanent sub-committee on investigations came to the conclusion that crime which exploits offshore haven banks, trusts and companies were extensive and expanding and "it challenges the basic assumptions regarding the ability of federal and state authorities to enforce the law".[3] The US continues to maintain its relentless pressure on offshore host countries for greater disclosure and supervision of international banking business.

The reason for the use of offshore centres for crime-related financial transactions is the existence of specific secrecy or blocking statutes or common law precedents or sanctioned practices which deny access to informations on bank accounts, money transfers and identity of beneficial owners of bank accounts and registered companies. The main tax havens are in the Caribbean region, the Bahamas, Bermuda, The British Virgin Islands, the Cayman Islands and the Netherlands Antilles, in Europe the Channel Islands, the Isle of Man, Liechtenstein, Luxembourg and Switzerland. (Switzerland is not considered as an offshore centre as no special privileges are conferred for promoting international business.) In the Asia-Pacific region, Hong Kong and Vanuatu are the main tax havens.

Recent Performance of Offshore Centres

The share of offshore centres in the external assets of banks in major selected financial centres declined from 25.2 per cent in 1983 to 22.4 per cent in 1988 and their growth rates have slowed down in recent years (see Tables 1 and 2). Part of the reason for the declining share of offshore centres has been the remarkable growth of Japan since 1985 as a financial centre and also the decline in the syndicated credit sector of the euromarkets. A close examination of the centre-wise business of offshore centres in developing countries shows that with the exception of Singapore and Hong Kong, the business of most centres either stagnated or has declined in 1987 and 1988 as compared to earlier years. The more adversely affected are the Bahamas (non-bank credit from Bahamas sharply declined), Panama and the Netherlands Antilles, Bermuda, Barbodos, Lebanon, Liberia and Vanuatu have hardly managed to secure any reckonbale business in recent years. External assets of Hong Kong and Singapore were about $ 309.7 billion and $ 248 billion respectively in 1988. In both these centres interbank transactions predominate, i e, they are 78-81 per cent on the asset side and 80-100 per cent on the liabilities side. Non-bank credit accounted for 18.5 per cent of the total offshore bank credits in Hong Kong and about 27 per cent in Singapore in 1988 (see Tables 1 and 2).

The assets of the IBFs of the US have increased at a lower rate after the initial spurt in the activity in 1981-83. According to a staff study of the board of governors of the Federal Reserve System (US) in 1988, "The consensus in the banking community is that the IBFs have not created substantial amount of new business. Rather, the business now on the IBFs' books was either shifted there from establishing entities or their foreign offices or would, in the absence of IBFs, have been booked at established entities or their foreign offices. In the case of large US chartered banks, most of the assets and liabilities shifted to IBFs were originally on the books of their foreign branches ... Because many of the transactions booked at Caribbean branches of US banks were actually conducted in New York or other financial centres in the United States, IBFs simply permitted a more rational and operationally efficient pattern of booking for such transactions. As a result, there do not appear to have substantial income or employment gains in the United States associated with the introduction of IBFs." The FED study concluded that "IBFs have not turned out to be the dramatic innovation that some had predicted".[4]

The experience of JOM (Japan) is not any different from that of the IBFs. The initial growth of business attributable to the shifting of business from overseas branches to the books of the JOM has not been maintained in 1987 and 1988. The nature of the "round tripping characteristic of offshore business is evident in the JOM also. For instance, a significant part of the $ 37 billion of new funds taken up by the banking units of the JOM in 1987 was on-lent to related offices, mainly in other Asian centres. These funds were in turn rechannelled through the Japanese banking system to domestic non-bank customers.

Current Features of International Financial Markets and Their Implications

International financial markets have undergone substantial changes in terms of the scale of operations (market size), global integration, innovative financial and derivative products and also regulatory measures on the part of supervisory authorities to manage the risk exposures of banks. Are these developments more favourable for the establishment of an offshore financial centre in India? It would be useful to examine carefully the current market features and their implications for the proposed Indian offshore centre. The following are some of the main features having a bearing on offshore centre business.

(1) The growing integration of financial markets and the ease for financial outflows and inflows unhindered by official controls, have in fact reduced the importance of offshore centres. This fact has been confirmed by the IMF's *World Economic Outlook* (1989) which observes that "the growing integration of financial markets and the sharp fall of data processing and telecommunication costs have encouraged investors in many countries to diversify portfolios across borders, thus reducing the importance of physical proximity to offshore centres".[5] There is an allied facet of the financial integration that further reduces the importance of offshore centre business. As domestic financial markets of a large number of developed countries have been liberalised, the business which earlier was driven offshore by domestic restrictions is likely to come back onshore to a large extent, except the business of centres which offers protection due to the provision of secrecy or significant tax advantages. Some banks have

already started closing down their business in those centres which offer little natural business. The centres affected so far include Bahrain, Bahamas, Panama and Bermuda.

(2) Similarly, the application of uniform rules for supervision of international banking business on a consolidated balancesheet basis, particularly those applicable on capital ratios, liquidity ratios, will remove some of the major incentives for offshore outfits. There is now greater evidence of a tendency for integration of offshore and onshore business and their location in home countries or in major financial centres.

(3) Another development which will have an adverse effect on offshore centres is the sharp decline of direct financial intermediation by banks, and the growth of securitised lending (capital market activities such as bonds euronotes, commercial papers, etc) and the increased use of financial packages involving currency and interest rate swaps,

options and multi-option facilities. For ra[ising] funds directly from the markets, prox[i]mity of investors, time-tested infrastructu[re] for primary sales of financial intstrument[s,] custody and transfer of instruments and op[-] portunity for developing active secondar[y] markets are necessary. Besides, major bo[r]rowers in the securities markets are the cor[-] porate entities from the developed countrie[s.] Even before the current boom of the secu[-] rities markets took place it became increas[-] ingly evident that central bankers an[d] wealthy individuals tended to bypass peri[-] pheral offshore centres like Bahrain an[d] preferred to deal directly with major centre[s] like Tokyo, London, Zurich, New York, etc because of their investment opportunitie[s] and expertise. The exaggerated expectatio[n] of becoming a significant collection centr[e] for OPEC deposits by Bahrain did no[t] materialise, even before the OPEC funds dried up.

(4) The changes in the pattern of source of funds and the home country of banks and securities firms dominating the financial markets will have significant implications for the future of offshore centres. Between 1983 and 1988 the external claims of banks (foreign currency and domestic currency claims on foreign residents) of selected major financial centres (the UK, the US, Japan France, Luxemburg, Germany, Belgium, Australia and offshore centres in developing countries) more than doubled from $ 2172.2 billion to $ 4509.4 billion. The share of Japan rose sharply from 5 per cent to 16.3 per cent whereas the share of the US declined from about 20 per cent in 1983 to 13.4 per cent in 1988. The share of the UK has also declined from 22.3 per cent to 19.9 per cent during the same period (see Table 2). Most European countries registered either declining or stagnant shares in international financial business. As far as the international banking market is concerned the Japanese market has already superseded London.

(5) A similar remarkable change has occurred in the source pattern and intermediation channels of net private financial flows. Japan and West Germany have emerged as the main sources of net private capital flows since 1985 as counterparts of their large and persistent current account surpluses. According to IMF, private capital outflows from Japan increased from $ 11.8 billion in 1982 to $ 50.6 billion in 1985 and further to $ 63.9 billion in 1988. Capital outflows from West Germany rose from $ 3.8 billion in 1982 to $ 36.4 billion in 1985 and $ 68.0 billion in 1988. However, the differences between the two countries in terms of maturity profile, types of instruments and intermediating institutions have been significant. In Japan, long-term portfolio investment outflows through non-bank institutions were predominant; direct investment also registered significant increase while bank intermediation was less. However, large inflows of short-term capital took place through the banks in Japan which they reinvested in ex-

FORM IIA

[See rule 4A(1)]

NOTICE

It is hereby notified for the information of the public that INDIAN ALUMINIUM COMPANY, LIMITED proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (2) of section 22 of the Monopolies and Restrictive Trade Practices Act, 1969, for approval to the establishment of a new undertaking/ unit/division. Brief particulars of the proposal are as under:

1. Name and address of the applicant : INDIAN ALUMINIUM COMPANY LIMITED
   1 Middleton Street, Calcutta 700 071.

2. Capital structure of the applicant organisation :

Share capital	Equity (Rs.)	Preference (Rs.)
(a) Authorised	79,60,00,000	40,00,000
(b) Subscribed and paid-up	41,49,66,580	—

3. Management structure of the applicant organisation indicating the names of the directors, including managing/wholetime directors and manager, if any : The Company is managed by a Board of Directors. Names of the Directors are:

   Field Marshal Sam Manekshaw —Chairman
   T.D. Sinha —Vice Chairman
   V.S. Sachdev —Managing Director
   C.W. Birkett
   G. Chidambar
   P.K. Choksey
   S.K. Dasgupta
   A.A. Hodgson
   R.K. Bhargava —Alternate for A.A. Hodgson and also wholetime employee
   A.L. Mudaliar
   P.K. Pal
   T. Mitra —Alternate for P.K. Pal and also wholetime employee
   H.T. Parekh
   B.R. Sule

4. Indicate whether the proposal relates to the establishment of a new undertaking or a new unit/division : The proposal relates to the establishment of a new undertaking by the name "Indal Exports Limited", a company incorporated under the Companies Act, 1956 for export of products manufactured by Indian Aluminium Company, Limited and other parties together with the business of import, trading etc.

5. Location of the new undertaking/unit/division : Registered office: 41 Chowringhee Road, Calcutta 700 071

6. Capital structure of the proposed undertaking

Share Capital	Equity (Rs.)
Authorised	20,00,000
Subscribed & paid-up	70

7. In case the proposal relates to the production, storage, supply, distribution, marketing or control of any goods/articles, indicate
   (i) Names of goods/articles : The proposal relates to the export of products manufactured by Indian Aluminium Company, Limited and other parties together with the business of import, trading etc.
   (ii) Proposed licensed capacity : Not Applicable
   (iii) Estimated annual turnover : Rs. 50 crores

8. In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc. : Not Applicable

9. Cost of the project : The proposal does not involve setting up of any project.

10. Scheme of finance, indicating the amounts to be raised from each source : The proposal will be financed out of internal cash generation.

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

INDIAN ALUMINIUM COMPANY, LIMITED
A. Sen
Vice President—Corporate Affairs and Secretary

Dated this 17th day of July 1989.

ternal markets by purchasing long-term securities. Thus Japanese banks have been engaged in recent years in maturity transformation in international financial markets, rather than intermediating between Japanese savers and overseas investors. In contrast, Japanese non-bank institutions (trust banks, life insurance companies, pension funds, etc) are active investors in overseas long-term securities. Bulk of Japanese non-bank investments are confined to high grade liquid assets bearing relatively higher interest rates. The investor profile of Japanese capital outflows and their bias for higher yield from long-term securities and for lower sovereign risks make it unlikely that these funds will move into offshore centres. However, with the recent changes (since November 1988) in the procedure for determining the prime rate and interbank money placements the ability of the banks to compete for funds with non-bank institutions may be enhanced. Thus, more funds from the Japanese markets may flow into the banks, which may in turn be lent to overseas borrowers, as well as medium and small firms in Japan at higher margins.

In West Germany, banks have been the main channel for recycling the country's current account surplus and they acted indirectly through overseas banks (inter-bank). Lending to other banks has increased steadily as a proportion of the assets of West German banks during 1982-88 period. Investment in non-bank foreign securities has declined as a proportion of total investment in securities, which is attributable to restrictions on the currency exposures of German banks. Inflows of long-term portfolio investment into West Germany have been higher than outflows since 1983, except for the year 1988. Thus, by and large German banks have been a source of inter-bank funds to overseas banks. Net private financial flows from the US has sharply declined reflecting the enormous current account deficit and the inflow of capital to finance it. There has been a virtual disappearance of outward fund flows through banks from the US.

(6) The emergence of Japanese banks and securities houses to top positions in international markets and the corresponding decline of the role of US banks (except in the derivative product market where American banks are predominant in foreign exchange trading and swaps) will have significant implications for offshore market development in the future. Japanese financial institutions are better placed to recycle her enormous current account surplus. For instance, Japanese banks are the largest nationality group in London today with 36.4 per cent of international assets at the end of 1988 despite the fall of their business in that year partly due to the growth of domestic foreign currency business in Japan and partly due to the transfer of business to JOM.[6]

Japan's net external assets have grown by 27 per cent in 1988 to $ 291.7 billion, the world's largest for the fourth successive year. Direct investment abroad in property (chiefly in the US), industry and commerce rose in 1988 by 43.8 per cent to $ 110.7 billion. Investment in foreign securities increased by 26 per cent to $ 427 billion. A related development is the sharp rise of Japan's share in net financial flows to developing countries to 47 per cent in 1986-87 from 11 per cent in 1980-81 (OECD source). The share of North America declined from 30 per cent to minus 12 per cent during the same period. Asia accounted for over 65 per cent and North America around 51.5 per cent of Japan's direct investment at the end of March 1988. Direct investment of Japan will necessarily increase in the future. As the exposure on the US, both in direct investment and US government bonds is already very high, Japan is likely to increase its involvement in the Asia-Pacific region, mainly for economic reasons rather than military or political designs, as in the case with the US investment and aid. Japan has already set up a quasi-private agency called Japan International Development Organisation mainly to promote investment in export industries in developing countries with half the exports expected to go to Japan.

(7) The increase in the total funds (bank loans, other medium-term borrowing facilities arranged by banks, and international bonds) is not an indication of the availability of funds, although it does signify the growing financial intermediation via international markets and therefore the business prospects of banks and non-bank institutions. A growing proportion of these activities constitutes the spilling over of traditional domestic financial intermediation on to the international markets. Private savers (individuals and corporations) through mutual funds, insurance companies and securities houses, place a larger proportion of their savings in the international markets to secure higher yield. At the same time corporations from the same country borrow abroad to secure funds at lower costs, and also currency diversification. Maturity and currency transformation are the chief benefits arising from the growing sophistication and growth of financial markets. The 'round trippings' which constitute a sizeable part of international financial business are not intended for real investment in plant and equipment but for 'playing the market'. For example, a typical form of fund-raising by corporate entities is equity-linked bonds, straight bonds in the international markets, swapping the proceeds for domestic currency, reinvestment of the same funds in a variety of instruments in the domestic or foreign markets. This feature is not confined to the financial markets but also equally applies to the foreign exchange markets. For instance, in 1988 foreign exchange trading activities contributed 17.7 per cent of the pre-tax profits of Midland Bank, 16.8 per cent of Bankers Trust, 18.7 per cent of Chase Manhattan, 15.8 per cent of Chemical Bank, 22.8 per cent of Citicorp and 14.2 per cent J A Morgan.[7] The daily turnover of the foreign exchange market is estimated to exceed $ 400 billion.

(8) The EEC plan for economic and financial integration of Europe by 1992, in which goods, services, capital and people can move freely, is likely to have a significantly impact on the activities of major financial centres, as well as offshore centres. As an initial step towards the financial unification, all member states of the EEC have already agreed to ensure the free movement of capital within the EEC by mid-1990. The unified European market may emerge as one of the large and dynamic financial markets in the world. The concern of major non-EEC banks about this prospect is evident from the public appeal by 18 leading international bankers, mainly the US and Japanese, for open access to the European markets after 1992. In the meantime

apanese banks and securities houses are roadening and strengthening their European networks to look as 'European as ossible'.

Another factor that may affect the international financial markets is the increased inancial requirements of European companies for consolidating and restructuring heir production capabilities to meet the intensifying competition in the unified European product market. Whether these levelopments will keep European funds vithin Europe and also draw funds from other countries are difficult to say at this tage. In any case, both European and non-European banks are likely to focus their attention in the next few years on their European strategy, particularly since the uniform Basle capital ratio and other regulatory measures will not permit a run-away expansion, as had happened in the 70s.

(9) The uncertain role of the private international markets in allocating resources efficiently is another important consideration relevant while evaluating the functions of the offshore centres. Experience so far has not been convincing in this respect. The external debt crisis itself speaks much about the tendency of banks to over-lend based on several wrong assumptions. With considerable prescience Antonio Ortiz Mena, in his inaugural address to the 15th meeting of the board of directors of the Latin American Development Bank in April 1974, warned about the danger of too much reliance on private capital markets. His warning was '...the eurocurrency market has provided a large volume of financing for the region in the last two years, but...this financing is being obtained on conditions that, without careful planning, can frustrate orderly management of the external debt and even weaken the internal savings efforts of our countries. ...These operations are transacted with scant knowledge of the feasibility of the projects, since brokers are commonly used to promote lending operations, especially in developing countries. Obviously, such practices can lead to the excessive use of credit and an improper allocation of financial resources. ...This observation is even more to the point if it is kept in mind that the countries sometimes resort to the eurocurrency market to finance the total cost of an investment."[8] A similar warning was also sounded by William Gaud, executive vice-president of the IFC in November 1973 when he said, "There are those who welcomed this growing recourse to the private capital market by the developing countries as a desirable trend... I see real risks in the developing countries borrowing so heavily in a market with no established standards and no overall surveillance to prevent unsound practices".[9] Now since the borrowings by most developing countries from the private financial markets have disappeared, except China and India, the revived syndicated loan market is directing a significant part of the lendings to finance mergers and leveraged buy-outs (M and LBOs). The latest OECD report (1989) indicates that syndicated loans associated with mergers, mainly in the UK and the US, exceeded $ 34.5 billion in 1988 accounting for 30 per cent and in the first quarter of 1989 $ 21.8 billion accounting for over 66 per cent of all new borrowings on the international financial markets. Commenting about the perils of the growing M and LBO related financing, Henry Kaufman warned recently that mergers and LBOs have contributed to a decapitalisation of US industry, with debt of non-financial corporations going up by an estimated $ 840 billion (15 per cent annual growth) while equity position has contracted nearly $ 300 billion. "Interest payments by these companies swelled to 26 per cent of internal cash flow, an all-time high... Financial calamity may occur during recession—the unfortunate truth is that all parties involved in M and LBO have a strong vested interest in their continuation. Members of corporate management, shareholders, commercial banks, investment bankers and lawyers, all find these deals so lucrative that it clouds their objectivity. Losers will be the bond-holders, they lack the strong constituency and legal standing needed to fight back". He added, "I think most of us would agree that we don't want the kind of free enterprise system in which we ostensibly put our faith in market discipline but whisper in the closet that the government will always bail people out if anything nasty happens. But that's what we will end up with if we don't curb the leverage that's threatening our economy".[10]

III
Cost-Benefit Aspects of an Offshore Centre in India

Against the foregoing international financial market developments and the changed domestic situation in terms of a more liberalised financial market and economy, let us evaluate the cost-benefit of an offshore centre in India. An analysis of these aspects undertaken by the author in 1981 under the then existing conditions came to the conclusion that in terms of increased access to overseas funds, employment generation, earnings from fees, taxes, etc, and opportunity to develop international banking business or expertise, an offshore banking centre would confer no significant advantages to India. On the other hand, the adverse effects of the centre on exchange rates, interest rates, domestic money management and also costs for telecommunication facilities and supervisory system would be substantial.[11]

No doubt, a financial centre like London, New York or Tokyo confers substantial benefits on the host countries. In fact, the financial service industry is one of the largest sources of foreign exchange earning of the UK. As already indicated, these are natural centres due to their economic and financial importance in the world. Although adequate information is not available, regional financial centres like Singapore and Hong Kong also confer some advantages on the host locale, say, around one per cent of GDP; considering their limited resource position, small population, etc, these are important for them. In an IMF study, Ian MacCarthy has pointed out that eurodollars when booked offshore, the monies never leave the major financial centres. When banks are in fact shells or brass plates "there is little employment opportunity. One lawyer agent can 'operate' 20 banks. Since tax havens do not tax, the only revenue gain is from licensing. Hence, gains calculated as a portion of the national budget can be small indeed."[12] A similar study of the Bahamas offshore centre by R Ramsaran also found that "banks engaged exclusively in offshore operations are of no consequence as loan generators to local government or commerce. In the Bahamas, for example, government borrowing is largely supported by those international banks which operate locally as well as internationally".[13] Referring to the benefits to host countries, the study by the US Senate Permanent Subcommittee on Investigations observed that "in seeking to attract offshore banking, local authorities in less devloped regions may exaggerate anticipated benefits. There is no simple answer to the intricate question of the value of offshore banking to haven jurisdictions. At the very least one must specify benefits and cost—to whom, what kind—take note of trends over time, and be sensitive to the general rule outlined here to the effect that each offshore jurisdiction and financial centre must be examined on a case-by-case basis. Equally important, one must recognise that the sanguine expectations or evaluation on the part of local authorities may fail to consider the complexity of the issues involved, especially long-term risks."[14]

The benefits India may derive from an offshore centre can be evaluated under the following broad groups: (i) increased access to international funds and better terms of borrowings; (2) better facilities for managing our external debt efficiently; (3) earnings from taxes, fees, employment and other local expenditure; and (4) opportunity to develop international banking business and expertise. The costs/risks of an offshore centre arises from implications for monetary management, nexus between crime and offshore financial operations, competition to banks in India and the costs of setting up telecommunication facilities and bank supervision system.

(1) Increased access to international funds and better borrowing terms: Before we take up this issue, it is important to assess the scope for borrowing, i e, the demand side of the funds.

According to the World Bank's *World Debt Tables* (1989), the outstanding external debt of India was $ 46,370 million at the end of 1987. The debt service burden on public and publicly guaranteed long-term debt was $ 3,296 million and on private non-guaranteed debt $ 901 million at the end of

1987. The projected debt service burden on long-term debt alone has been placed by the World Bank at $ 4,626 million in 1989. OECD, *External Debt Statistics* (1988), has estimated India's debt and liabilities outstanding at the end of 1987 at $ 50,375 million. This includes non-bank trade related claims, guaranteed bank claims, other bank claims, non-bank deposits, multilateral loans, other claims and use of IMF credit. Since India has borrowed substantial amounts in 1988 ($ 2,507.4 million in the private international financial markets) and in view of speedy utilisation of aid commitments, the total external debt of India now would be around $ 60 million. With an outstanding debt of this magnitude and the persistent and large trade deficit and debt service payments, the debt service burden of India has become a matter of serious concern both in India and abroad. The OECD's *Report of the Development Assistance Committee*, 1988, observed that "For both China and India, debt service burdens are now increasing quite sharply. (The debt service/exports ratio is at a much higher level in India than in China however.) Although in neither case is any major problem imminent there is a clear need to follow policies which will maintain and increase debt servicing capacity in the future."[15] Although the OECD's prescription is more economic liberalisation and boosting of exports, our exports will face increasing challenges not only in the US (which has listed India among the countries pursuing unfair trade practices to apply 'supper 301') but also in the unified European markets. It is, therefore, undesirable to take recourse to an active market borrowing strategy at this stage. Instead, India should make all efforts to secure more bilateral assistance to tide over the short-run requirements, while at the same time take long-term measures to reduce dependence on foreign capital. It is equally an inopportune moment to bring about an institutional change in India's external financial linkage by establishing an offshore centre for the purpose of increased borrowing.

Even assuming that India launches an active borrowing strategy, it is unrealistic to expect international banks and private investors to respond in any significant measure to our increased demand for funds. It is also important to note that out of the total $ 2,358.7 million in 1987 and $ 2,507.4 million in 1988 raised by India in the international markets, as much as $ 1,397.7 million in 1987 and $ 1,185.2 million in 1988 were from the internationl bank loan markets. In other words, the non-bank capital market access which is confined basically to high quality borrowers, to which India made some forays in the past, may not absorb more of India's debt papers. Institutional investors in the capital markets are highly sensitive to country risks. Due to exhaustive and up-to-date collection and dissemination of information on external borrowings of developing countries and greater transparency of country exposures, the type of excessive lending by banks that took place in the 70s and early 80s is unlikely to recur in the future. Whatever exposure limit a bank fixes for a specific country (including loans, guarantees, acceptances, foreign exchange trading, inter-bank fund placements, etc) is allocated among its branches and fully owned subsidiaries spread over all financial centres. Therefore, the presence of an offshore centre in India will not in any way enhance our ability to borrow more funds.

Due to the availability of excellent telecommunication facilities and the sharp fall in their costs, physical proximity to a borrower is irrelevant for lending by a bank, or borrowing by a borrower. In the initial stages of the development of the syndicated credits, probably that was required to give a certain extent of confidence to the banks.

Offshore bank units, by the very nature of their business, i e, wholesale interbank money and foreign exchange trading, managing issues of securities, etc, are ill equipped to collect and analyse information on a country or individual borrowers in the host country. Since an offshore banking unit does not interact with resident entities in the course of its normal business, it is unlikley to establish contact with local firms, particularly small and medium enterprises. International banks operating domestically in India are in a better position to arrange loans and other facilities through their onshore or offshore branches. What is relevant to private cross border lendings is country credit rating. Institutional and country ratings are required to meet investor requirements. Unless borrowers in the capital markets carry a triple 'A' rating, access to the non-bank capital market is also difficult.

Similarly, those familiar with the *modus operandi* of loan pricing or determination of fees for securities issues will recognise that competition in the market has already driven the fees and margins very low and good borrowers are able to borrow below LIBOR. Fees for arranging securities issues are also very thin. What matters most in the market is the name of the borrower which will ensure the sale of the notes in the primary markets. Besides, the increased use of currency and interest rate swaps in the financing packages make major financial markets more suitable for securitised borrowings than an offshore market in India. Though in the late 70s and early 80s India used some offshore markets like Bahrain, in recent years almost all of India's borrowings had been made in major international financial centres or in the foreign sector of the domestic markets in Switzerland, Japan, etc.

The opportunity for small and medium companies to borrow has been suggested as one of the benefits that India would derive from an offshore centre programme in India. Obviously, big companies, whether public or private and also Indian banks do not require an offshore centre in India to avail of foreign currency loans. At present financial institutions in India, like the IDBI, ICICI, IFCI, and EXIMBANK, provide foreign currenc loans to small and medium enterprises a part of their capital investment financin programmes. Already such borrowers ar hard hit by currency and interest rate risks Facilities for converting future borrowing into rupee liabilities at 'basket rates' or 'com posite cost' with ceilings on the costs hav been worked out (effective April 1989 jointly by these institutions. At present direc foreign currency borrowing by small an medium firms from an offshore centre i India is neither desirable nor necessary a their foreign currency requirements ar already met satisfactorily either by India bank branches abroad or by the financia institutions.

India acting as a transit point fo neighbouring countries is also not a feasi ble proposition in the uncertain political an economic conditions in many countries i

he region. In this sense there is no foreign hinterland for an offshore centre in India. With a view to encouraging the growth of the Singapore offshore centre, the authorities have allowed borrowing by resident companies. Similarly, Australia (offshore centre established in 1986) has permitted resident deposits in offshore units provided they are utilised for offshore lending. India has limited scope for boosting an offshore centre by permitted large borrowings/lendings by Indian companies.

(2) Better facilities for managing external debt: The need for managing our external debt for reducing costs and securing a more appropriate maturity and currency profile cannot be over-emphasised. This is an ongoing activity. An active debt management strategy will include debt renegotiations, pre-payments, currency and inerest rate swaps and options, etc. For these activities centres with depth and breadth and also active foreign trading in foreign exchange swaps, options, futures and also broad and deep secondary markets are required. An offshore centre in India can hardly provide adequate facilities for sophisticated liability management of medium and long term debts. Even Indian banks in overseas markets would not be of much help in providing such facilities, except as agents for arranging hedging facilities from the markets.

(3) Earnings from taxes, fees, other expenditure of offshore banks, etc: The earnings from an offshore centre arise mainly from operating expenditures of offshore financial units in the host locale, and licensing fees, profit tax, stamp duty, etc. The local expenses of offshore units are so insignificant in relation to the Indian government's budget and also in relation to the employment problem of India. Such earnings are somewhat important from the point of view of small island states like Panama, the Bahamas, Cayman Islands or Singapore. In Bahamas, for instance, there are about 360 banks and trust companies. Together they employ about 3,000 persons. Earnings from tourism related to banking services (annual meetings of banks, etc) also contribute to the economy. In most centres the only levy imposed is licensing fees as offshore business is exempt from corporate income tax and withholding tax, if at all levied, is very low. Taxation policy is an important factor in the choice of the centre where international business is booked. Taxes on gross interest (withholding tax) is a major deterrent to offshore banking than direct taxation on profits.

(4) Opportunity to develop international banking business and expertise: There are many who envision that the presence of an offshore centre in India will enable Indian banks to expand their profitable international banking activities. This hope is rather misplaced due to several reasons. First, the scope for developing offshore business in India is extremely limited. The time zone advantage and proximity to borrowers (borrower proximity is itself doubtful) are not of much relevance in current international financial markets. Political and economic conditions in Asian and Middle East countries have belied earlier expectations of these countries emerging as big borrowers/lenders. Tokyo, Hong Kong and Singapore are more conveniently located, and complement each other, mainly due to the ethnic links with the business community in Indonesia, Philippines, Malaysia, and China. India's own borrowing capacity is very limited for supporting an expensive offshore centre. If lending opportunities are not there, there would be no demand from banks and finance houses to set up an expensive offshore presence in India. Just for the purpose of undertaking interbank operations, which they can as well manage from their existing centres by stretching the operating time, they may not establish offshore outfits in India.

Even if there is scope for the growth of an offshore centre in India (which itself is doubtful), the ability of Indian banks to profit from it would be limited. The inadequate capital-base of Indian banks and inability to raise adequate working capital from the home-base stand in the way of the increased involvement of our banks in international markets. The decline in lendings by American banks and the remarkable growth in the share of Japanese banks and non-bank financial institutions during 1983-89, particularly in London, offer ample proof that unless the home country's external base is comfortable, banks can hardly hope to play a significant role in the international financial markets. When Japan faced an uncertain balance of payments situation in the wake of the second oil price hike, Japanese banks were held on a tight leash by the Japanese ministry of finance. Their remarkable growth since 1985 is a counterpart of Japan's persist current account surplus. The Basle framework to impose uniform risk-weighted capital ratio on banks operating internationally (8 per cent risk-weighted capital/asset ratio) will come into effect in 1990. Major Japanese and European banks have already managed to strengthen their capital to meet the capital target ratio, either by raising subordinated debts or equity-linked bonds or by revaluing their assets (particularly stocks and properties). Capital ratio of Indian banks are much below the Basle standard. Under the present budgetary and balance of payments position of India, a substantial increase in the capital ratios of Indian banks does not appear likely.

On the business side the main growth areas are treasury operations and investment banking activities. Treasury operations mainly consist of interbank money and foreign exchange, trading and other market-related trading operations (securities on bank's own account or for customers). These are high risk, high profit business. Due to their inability to take risks and also lack of financial resources and expensive expertise, Indian banks can ill-afford to engage in treasury operations in a big way, except to manage their own currency and interest rate exposures or funding requirements. Similarly investment banking covers an assortment of new business such as issue management, placements, secondary market-making, trading in stocks and money market securities, swaps, options, futures, leasing, etc. These are the growing market sectors, but an effective presence will require not only expertise but also absorption and placement capabilities of securities and other financial instruments. A significant market involvement of Indian banks in these sectors at the moment does not appear feasible. Whatever small role they will be able to play depends on major institutional restructuring of their overseas branch network. Since Asia-Pacific and Continental Europe are emerging as the dynamic market centres, Indian bank's presence in these centres needs to be strengthened. Only two or three Indian banks should be encouraged to plan an effective presence in all major centres for undertaking wholesale international financial activities. An offshore centre is not the appropriate strategy for promoting India's international banking business or expertise.

Costs-Risks of an Offshore Centre in India

An offshore centre isolated entirely from the domestic financial market, like the IBFs and JOM, is unlikely to have any significant impact on the conduct of monetary policy. Supervision of the offshore units will present problems, but the nature of such problems is different from a centre with partially an integrated offshore and onshore business.

When the 'free banking zone' proposal was first mooted in the US, though the Federal Reserve Board was concerned about the effects such a scheme might have on the conduct of monetary policy or for bank supervision, its staff study in 1988 has come to the conclusion that "to date, the operation of IBF has not presented a problem either for the conduct of domestic monetary policy or for bank supervision".[16] On the other hand, in Japan loopholes led to considerable arbitrage operations between the domestic money markets of Japan and the euroyen markets in 1987 and 1986 and the Bank of Japan reversed the outward flows by liberalising the money markets which raised the domestic short-term interest rates and aligned them with the international rates. Singapore had frequent problems but by combining incentives with rigid enforcement of disciplinary action on ACUS (offshore banks engaged in offshore financial activities are called Asian currency units) Singapore manages to limit the impact of offshore financial business on the domestic economy. Philippines which tried to develop an offshore banking centre in the 70s also experienced hot money flows in and out of the country and also large borrowings by its companies "which did not help either its

development or stability" and was forced to reschedule the external debt.

While discussing the approach of the Bundesbank to setting up an offshore centre in Germany, Kohler, a member of the Directorate of the Bundesbank, observed in 1985 that "very careful consideration has to be given to the question as to whether a country with its own system of credit policy and banking supervision instruments should compete with an offshore centre that does not conduct a credit policy of its own and hence has no need of effective instruments of monetary policy".[17]

Supervision of offshore units, if the same institutions are undertaking both onshore and offshore business, is difficult. The close monitoring and surveillance of the variegated, complex and changing business of offshore units will require very high professional expertise and an elaborate supervision and reporting system. There is also need for adequate mechanisms for dealing with potential run on banks (lender of last resort facilities), particularly since the bulk of offshore business constitutes interbank operations.

A related aspect of an offshore centre is the country credit rating of India. The Citibank's Manila episode in 1983, when it froze $ 600 million of interbank deposits, has raised serious doubts about the nature of country risks on offshore banking. Even now there is no unambiguous answer to it, but banks do attach importance to the risks attached to sovereign and interbank risks of their business locations.

A sophisticated offshore centre requires very large investments in telecommunication facilities, much in excess of the requirements of the domestic banking industry. Whether such expenditures on telecommunication and supervision systems are justified by the return from an offshore centre must be considered carefully. As already indicated, the benefits by way of earnings from fees, taxes and local expenditure of offshore banks (discounted earnings) may not justify the enormous initial capital expenditure on infrastructure facilities

Crime and offshore centre: The growing nexus between crime and related fund transfers, and the increasing inability of supervisory authorities to control and supervise offshore banks' operations have already been highlighted. An offshore financial centre in India, by providing conveniently located facilities, is likely to make such activities more extensive. It is important to note that the nature of operations in an offshore bank is so complex that the real identity of the beneficial owners of the accounts is difficult to establish. In the case of Bahamas, the observations made by R Ramsaran is worth recalling. According to him, "insofar as intimate ties develop between fraudulent operators and an elite, the leadership as a model for integrity is lost, with the consequence that the very character of the people becomes associated with fraud and dishonesty".[18]

To sum up, the international as well as India's domestic economic and financial environment and recent developments are not conducive at present for establishing an offshore centre in India. The integration of the major financial markets, the sharp decline in the cost of processing financial activities, the development of excellent telecommunication facilities and the growth of natural financial centres and their linked offshore centres have reduced the need for peripheral offshore centres. Under the existing situation, only those centres which offer secrecy, and also make it a non-negotiable fact, can hope to attract a reasonable volume of business. The scope for an offshore centre in India emerging as a regional financial centre is extremely limited due to the vulnerable economic and political conditions of south, south east Asian and Middle East countries and also the limited scope of India to permit resident borrowing and deposits in the offshore banking units. The balance of advantage for India lies in taking appropriate measures to forge greater economic and financial links with the dynamic Asia-Pacific rim and continental European financial markets. Indian banks' presence in these centres should be strengthened in planned phases. For this the restructuring of their institutional set-up and a large induction of capital to a selected group of two or three banks are necessary. What India should aim is the establishment of mutually beneficial economic and financial relationships with countries which have a long-term and durable economic strategy in the Asian region and also have comfortable balance of payments position to underwrite such a strategy.

FORM IVA

[See Rule 4A(1)]

NOTICE

It is hereby notified for the information of the public that **Indian Aluminium Company, Limited** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under sub-section (4) of section 23 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the take over of the whole or part of Indal Exports Limited.

Brief particulars of the proposal are as under:

(1) Name and address of the applicant

Indian Aluminium Company, Limited
1 Middleton Street
Calcutta 700 071

(2) Name and address of the undertaking the whole or part of which is proposed to be taken over and the manner of take over i.e. by acquisition of shares, acquisition of control or management, whether by the acquisition of the ownership of the undertaking or under any mortgage, lease or licence or under any agreement or other arrangement

Indian Aluminium Company, Limited proposes to invest in Indal Exports Limited, 41 Chowringhee Road, Calcutta 700 071 by subscribing to shares being offered by that company.

(3) Management structure of the applicant

The Company is managed by a Board of Directors. Names of the Directors are:

Field Marshal Sam Manekshaw — Chairman
T.D. Sinha — Vice Chairman
V.S. Sachdev — Managing Director
C.W. Birkett
G. Chidambar
P.K. Choksey
S.K. Dasgupta
A.A. Hodgson
R.K. Bhargava — Alternate for A.A. Hodgson and also wholetime employee
A.L. Mudaliar
P.K. Pal
T. Mitra — Alternate for P.K. Pal and also wholetime employee
H.T. Parekh
B.R. Sule

(4) Capital structure of

(a) The Applicant

Share Capital	Equity Shares	Preference Shares
Authorised	79,60,00,000	40,00,000
Subscribed and paid-up	41,49,66,580	—

(b) The Undertaking proposed to be taken over

Share Capital	Equity Shares	Preference Shares
Authorised	20,00,000	—
Subscribed and paid-up	70	—

(5) Line(s) of business of the undertaking which will or is likely to emerge as a result of the proposed take over

Export of products manufactured by Indian Aluminium Company, Limited and other parties, business of import, trading etc.

(6) Consideration for the take over

The applicant will acquire the entire 1,39,993 shares of Rs.10 each, at par against payment in cash, by way of subscription to the fresh capital to be issued by the undertaking.

(7) Scheme of finance indicating the source(s) of finance for the proposed take over

The proposed take over will be financed out of internal cash generation.

Any person interested in the matter may make a representation to Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, Dr. Rajendra Prasad Road, New Delhi within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Indian Aluminium Company, Limited
A. Sen
Vice President — Corporate
Affairs and Secretary

Dated this 17th day of July 1989.

Panchayati Raj at Crossroads

Indira Hirway

This paper studies the concepts of panchayati raj, examines the inadequacies of these concepts and the potentia of panchayati raj in our economic-political system. It analyses the experiences of panchayati raj in different states and draws lessons from these experiences. It then critically examines the 64th Constitutional Amendment Bil and makes some inferences about the implications of strengthening panchayati raj in the country.

SINCE the Balwantrai Mehta Committee recommended panchayati raj System in India way back in 1957, several attempts have been made, at the national as well as state levels, to strengthen the panchayati raj system in the country. After struggling for about 30 years, however, the government of India suddenly seems to have found 'the solution', in the form of the Constitutional (64th) Amendment Bill, to all the weaknesses of panchayati raj. It is argued that "this bill seeks to enshrine democracy at grassroots", as it intends "to give power to people"; and it will "end corruption, and fight and finish power brokers and middlemen" in politics. The prime minister has claimed that this bill is "a historic and revolutionary bill" and its introduction in the Lok Sabha is "the single greatest event after the enactment of the Constitution".[1]

What is so special about this bill? Is it likely to strengthen panchayati raj in India? The present paper intends to answer these questions carefully. Its main objectives, therefore, are (1) to study the concepts of panchayati raj used in the country over the years, examine the inadequacies of these concepts as well as the potential of panchayati raj in our economic-political system; (2) to examine the experiences of panchayati raj in different states and draw lessons from these experiences, and (3) discuss the proposed amendment bill critically in the light of the above and infer the implications for strengthening panchayati raj in the country.

I

Concept of Panchayati Raj

Evolution of the Concept

When Mahatma Gandhi discovered that there was no mention of panchayati raj in the earlier draft of the Constitution, he insisted on its inclusion in the revised draft, because panchayati raj was an important component of his vision of future India in which economic and political power was decentralised and each village was self-reliant economically. He felt that people's voice should be reflected in our independence through panchayats, and therefore, 'the greater is the power of panchayats, the better it is for the people'.[2] Article 40 of the Constitution, which was included (at Gandhiji's insistence) in the chapter on Directive Principles of State Policy said that 'the state shall take steps to organise village panchayats and endow them with such powers and authority as may be necessary to enable them to function as units of self-government.[3]

The Balvantrai Mehta Committee attempted to translate this article in a major action when it recommended introduction of panchayati raj system in India in 1957. While explaining its philosophy the committee remarked that 'PR system establishes a linkage between local leadership enjoying confidence of local people and the government, and translates the policies of the government into action'.[4] The committee thus saw PR system as a means of involving people and their representatives in development programmes of the government.

When it was observed by several state level committees as well as by regional studies that the PR system was suffering from a number of weaknesses, an all-India committee, namely, Ashok Mehta Committee, was set up in 1978 to look into its working in various states and to make recommendations for strengthening it.[5] Ashok Mehta Committee viewed the role of PR system slightly differently. According to the committee, PR system was not only meant for decentralisation of power and people's participation, but it was also for supporting rural development and strengthening the planning process at the micro-level. The committee therefore wanted PR institutions to participate in development activities in the areas of agriculture, forestry, cottage industries, welfare activities, etc. The major recommendations of the committee therefore included two-tier PR system consisting of zilla parishad and mandal panchayats (covering about 15,000 to 20,000 population), reorganisation of zilla parishad and its membership, open participation of political parties in PR elections, constitutional protection for further decentralisation of power, etc. A few of these recommendations were accepted by some states, but most of the recommendations were not implemented.

With the expansion of anti-poverty programmes and setting up of district rural development agencies and other related organisations at lower levels, the need for integration of PR system with development programmes and administration was felt. C H Hanumanth Rao's Working Group on District Planning [1983][6] and G V K Rao Committee which was set up to review the existing administrative arrangements for rural development and poverty alleviation programmes [1985][7] have given recommendations for this purpose. The G V K Rao Committee, for example, has recommended strengthening of zilla parishads and distri level planning, as well as better integratic of block and lower level planning with low level PR institutions. Recently, Singhvi Cor mittee [1986-87] has prepared the Conce Paper on Panchayati Raj[8] which wants P institutions to be closely involved in plai ning and implementation of rural develop ment programmes at lower levels. Th Singhvi Committee has recommended th village panchayats (of groups of sma villages if necessary) should be made viab (by combining 2-3 villages in one panchay and by strengthening their finances). It ha also supported the recommendations of th G V K Rao Committee for integrating ad ministrative structures with PR institutions The Singhvi Committee as well as Asho Mehta Committee suggested suitable cor stitutional amendments for the purpose.

It seems that the concept of panchayat raj has undergone some changes over th years. Though it started as a narrow concept it has expanded to cover areas of rura development and economic planning t some extent. In spite of this expansion however, the concept still suffers from a number of limitations. First of all, the concept is still very narrow as it does not view PR bodies as bodies which can play an important role in the overall development of our rural areas. In other words, the present concept does not see a PR body as a planning as well as implementation agency of various rural development programmes, and as an agency that can take care of routine administration, infrastructure and socio-economic welfare of rural population. Secondly, there is not much clarity about the inter-relationship between PR bodies and development administration. As there is no separate cadre of administration for PR bodies, the dual responsibility of the administration (towards state departments and towards PR bodies) creates lot of confusion and complications. Thirdly, there is no clarity about how to involve the weaker sections in the functioning of PR bodies. On one hand, there is a feeling that PR leaders do not involve the poor in PR bodies and therefore administration has to intervene to reach the benefits of growth to the poor, while on the other hand the involvement and control of PR office bearers in rural development activities is increasing continuously. There is therefore considerable confusion about the role of PR bodies in rural development programmes—specially anti-poverty programmes. And lastly, there is no clear trend emerging in the context of decentra-

lisation of power. On one hand, there is a lot of talk about decentralisation of power to district and lower level bodies, while on the other hand central schemes are increasing both in number and size. One cannot really make out what kind of decentralisation we are heading for.

In spite of these limitations of the present concepts underlying PR systems in India, one cannot deny the potential of panchayati raj in a country like ours. One can say that panchayati raj has to play a very important role in the overall development of the economy and policy of the country.

ROLE OF PANCHAYATI RAJ IN INDIA: THE POTENTIAL

It can be said that PR institutions are essentially meant for democratic decentralisation below the state level—at the district and lower levels. These institutions, which are formed by the members—elected directly or indirectly by people—are expected to enable people to govern themselves.

1 The first important role of PR institutions is to encourage participative decision-making at micro-level by involving people and people's representatives in decision-making process in various areas of activities which fall in the purview of the district or lower level micro-level units. PR institutions are also expected to involve people as beneficiaries in these activities so as to enable them to participate in the main stream of economic activities.
2 PR institutions should take care of the day to day administration of the local areas by mobilising local resources and by managing administration of local facilities like drinking water, other sources of water, primary school, cleanliness, primary health, etc.
3 As local bodies, these institutions should strengthen the planning process by formulating micro-level plans on the basis of the constraints of development as well as the potential of development for the local area. These plans are expected to strengthen the planning process at the micro-level and optimise development. It can be said that PR institutions should contribute to planning and implementation of programmes in sectors like agriculture, minor irrigation, animal husbandry, household industries, public works, input supply and their distribution, etc.
4 PR institutions should also take care of local physical infrastructure (roads, other transportation and communication facilities, electricity, energy, etc), social services (health, nutrition, sanitation, hygiene, housing, primary education, adult education) and social welfare activities for women, children and the poor.
5 And lastly, these organisations should also work for awakening people—specially the poor, and make them aware about their plight, their rights and their role in rural development.

It is clear from the above discussion that we have to go a long way to tap the potential of panchayati raj in India. The important question, however, is how do we develop the present system to reach the goal? The answer to this question will have to be sought from the experiences of panchayati raj in India.

II

Panchayati Raj in Practice

The working of PR institutions has been studied by several scholars in various states and also by some state level and all India committees.[9] A major conclusion of these studies has been that in spite of some sporadic achievements, PR system cannot be rated as a very successful system. First of all, PR institutions have not been able to involve the poor in development activities either as beneficiaries or as decision-makers on any significant scale. In fact, it is shown that these institutions have harmed the interests of the poor. Secondly, these institutions also have not contributed much towards strengthening the planning process at the micro-level. In other words, these institutions have not been involved enough in formulating block or district level development plans. And thirdly, therefore, these institutions have not played the expected role in the development process in rural areas in the sectors like agriculture, minor irrigation, household industries, socio-economic infrastructure, social services and social welfare.

It is frequently argued that the PR system has succeeded in some selected states like Gujarat, Maharashtra, Karnataka, Andhra Pradesh, etc. We would, however, differ as some intensive studies in these states have shown that these success stories are not afterall as glorious as they are made out to be. Indira Hirway's intensive study of the working of four village panchayats in four different types of villages in Gujarat[10] shows that (1) the panchayats serve the interests of mainly one group, namely, the group of big farmers and rich traders usually belonging to higher castes. The members of this group hold the power of decision-making in the panchayat (and the same group holds this power in other village organisations, such as farmers' service society, milk co-operative society, etc) and use it in furthering their own interests, (2) the SC/ST members of the panchayat are 'selected' by the elite group and they do not really represent the interests of the poor in the panchayat, and therefore, (3) the masses of the poor have practically no say in the decision-making process in the panchayat, with the result that the activities of the panchayat do not serve the interests of the poor. In fact, the PR institutions create obstacles in the participation of the poor in development activities including the special programmes for the poor.[11]

The Karnataka experiment of PR system is frequently quoted as a success story. It is argued that the zilla panchayats in the state are really emerging as a power centre below the state. However, studies by George Mathew (ed)[12] has shown that the power in the districts is enjoyed mainly by dominant castes belonging to the top power groups, and the interests of the poor are sacrificed for strengthening the vested interests of the district leadership.[13]

In the same way, Gurumurthy's study in Karnataka also comes out with similar findings.[14] It shows that the weaker sections are not benefited much by the village panchayats as they are neither fully aware about the functioning of the panchayats nor are they able to participate in their activities. And the other studies also clearly show that the socio-economic power structure in rural areas does not allow the benefits of PR system to flow towards the weaker sections.[15] It seems that though panchayati raj appears to be working well sometimes, it is working so mainly for the elite group or the group of big farmers and rich traders. The masses of the poor not only do not gain much out of the system, but are also exploited by the PR leaders.

CAUSES OF LIMITED SUCCESS

The available literature lists a number of factors responsible for these failures, which can be broadly divided into the following groups:

(1) *Structural Inadequacies*: It is argued that the PR structures that have been adopted by the state governments are just not capable of performing the role that is expected of them. First of all, the distribution of functions and responsibilities among PR institutions and the departments of state and central government has not been made on the basis of any sound rationale. For example, management of resources like land, water, forests, grazing lands, etc, should be in the hands of local institutions. In reality however, these are controlled by state/central authorities. Such an approach has created a wide gap between what PR institutions are empowered to do and what they should do. Secondly, PR institutions have limited support of expert staff for planning, implementation or monitoring of various development programmes. They hardly have any expert staff that can formulate plans, or monitor them systematically with the result that they are unable to play any significant role in strengthening the planning process at the micro level. Thirdly, there is a strong tendency towards centralisation in the country though there is a talk of decentralisation of planning. The scope of central schemes has increased tremendously during the past 20-25 years, and it is still increasing. Such a process of centralisation is just not compatible with the talk of decentralisation of planning. In fact, the plethora of rural development programmes and schemes implemented under the control of central and state governments has left a very limited scope for the functioning of local PR institutions. And lastly, the financial powers

of PR institutions are extremely limited. Number of studies have shown that village panchayats are very weak financially, and even taluka samitis and zilla panchayats have limited funds at their disposal to carry out their own programmes. It is observed therefore that the PR system has not been tried out seriously in the country. As L C Jain puts it, the PR institutions in our country have remained 'empty boxes' without much stuff in them.[16]

(2) *Socio-Economic Political Structure of the Rural Society*: The second group of factors responsible for the limited success of PR institutions are pertaining to the exploitative structure of our rural society. It has been shown by a number of regional studies as well as by all India committees that the elected members in PR institutions and the office-bearers are normally from the elite group (or the rich) of the rural society. As they have vested interests in preserving the exploitative structure, they are not likely to do anything that strengthens the position of the poor in their areas. In fact, their actions will go against the interests of the poor and increase their exploitation further.

It seems that the assumption that representative participation of the people at micro level will ultimately lead to mass participation in development activities on a large-scale has proved to be highly unrealistic. The experiences have shown that the old theories of participation which emphasise democratic decentralisation and participation of elected representatives as a first step towards mass participation are no more acceptable.[17] The new theories now consider beneficiary participation as the first step towards mass participation which ultimately leads to participation of the poor at the highest levels.[18] In other words, it is argued that PR institutions do not seem to be capable of bringing about mass participation of the poor in the development process in our stratified and hierarchical society where the weaker sections are almost completely unorganised. The failure of PR institutions in this context is almost inevitable.

(3) *The Role of Bureaucracy*: The third group of factors are pertaining to the assistance provided by government administration. We have seen above the PR institutions are assisted by government administration at various levels. The head of zilla panchayat administration is frequently an officer from the Indian Administrative Service, who is assisted by other lower officers and staff at district, block and village levels. Studies have shown that there are serious problems regarding this assistance and regarding the relationship between the bureaucracy and elected PR bodies. There is frequently a lack of mutual faith which results in mutual suspicion: Officials feel that PR members use power to further their vested interests and harass them (by threatening them of transfers) if they do not fall in line; while PR members dislike the 'superiority' of officials. Also, it is felt that officials have loyalty to their respective state departments and do not always co-operate with elected members. There is some truth in both these arguments, which deserve serious attention. First of all, the system line of hierarchy in administration makes the officials and staff feel that they are primarily accountable for results to the state government and to their bosses in the developments in the government. The staff therefore, does not feel fully accountable to PR institutions. Secondly, the plans and programmes implemented by the administration come from above and are prepared either by central and state level authorities or by the bureaucrats at the district and lower levels. The intervention of PR institutions, which is frequently *ad hoc* and abrupt, is considered as undersizeable by the government machinery. And thirdly, PR institutions do not have adequate expert support available to them in the field of planning, implementation and monitoring of various schemes and programmes. The final result of the dual loyalty of the bureaucracy and the lack of clear demarcation of their roles is confusion and misunderstanding.

(4) *Constitutional Constraints*: The fourth set of factors are the constraints which emerge from the Constitution of our country. It is observed (for example, by Ashok Mehta Committee) that many state governments have not introduced panchayati raj in their respective states; some have not held regular elections for panchayats and some have superseded PR bodies. It is argued that the Constitution should be amended (Ashok Mehta Committee) or a central legislation should be passed (Sarkaria Commission) to make it obligatory for state governments to implement panchayati raj, effectively. It is important to note the constitutional amendment recommended by the above committees was only for the limited purpose.

(5) *Unwillingness of Governments to Share Power with Lower Bodies*: The last set of factors, though not at all the least, are regarding the unwillingness of higher governments to share power with lower bodies. Many scholars have noted that there is an unhealthy trend of centralisation of power at the centre in our country: With the progress of development planning the number and size of central schemes have increased manifold in the last two decades or so. Also, the importance of 'High Command' in Congress(I)-ruled states has increased tremendously over these years. The reasons for this centralisation could be political insecurity, greed for power, lack of faith in lower governments, or increasing faith in central planning. Whatever are the reasons, the fact of reality is that there is less and less willingness on the part of the centre and state governments to share power with lower elected bodies.

An important consequence of this centralisation is that though there is a lot of talk of decentralisation, there are few evidences of lower bodies getting economic or political power. It seems that as long as this trend continues, panchayati raj will not be implemented with any seriousness.

Pre-Conditions for Success of Panchayati Raj

We shall now list some pre-conditions which seem to be necessary for the success of panchayati raj. The first important pre-condition is evolving a comprehensive concept of panchayati raj. Panchayati raj should not be treated as one more programme for rural development. It should also not be treated merely as a political concept as it has important implications for development and planning. It can be said that panchayati raj has to play three important roles in the country. Firstly, it has to bring about decentralisation of administrative and political power in the sense that it has to encourage self-governance and mass participation in its working. Secondly, panchayati raj has to contribute towards strengthening the planning process at the micro-level and overall rural development, and thirdly, it has to improve the access of the (poor) masses to the highest level of decision-making bodies. Such a concept obviously cannot be evolved merely by a constitutional amendment, it also calls for efforts in other areas like developing multi-level planning framework including strengthening of micro-level planning processes, integration of PR bodies with planning and administration, etc.

The second pre-condition is strengthening the poor so as to protect them from the exploitative behaviour of the rich. It is clear that the power structure which exists today in our rural areas is likely to exploit the poor—with or without panchayati raj. If the benefits of panchayati raj have to flow to the poor and if the poor are to be enabled to participate in PR activities, it is necessary that their position is strengthened by various means. Some of the steps which are likely to strengthen the poor against the rich could be listed as follows:

(a) Attacking the dependency of the poor by plugging the points of their exploitation. Efficient public distribution system, seed banks, grain banks, social security measures etc, are important in this context.

(b) Giving right to work to the poor so as to ensure them minimum employment and incomes to live on.

(c) Redistribution of assets in favour of the poor by implementing land reforms, and if this is not feasible at least by giving ownership of newly created assets to the poor and by developing common property resources for the poor.

(d) Encouraging organisations of the poor and recognising the role of trade unions and voluntary agencies in rural development and panchayats *explicitly* and *formally*.

We think that unless such steps are taken the poor will never be able to assert themselves to demand their rights and to

participate in panchayati raj activities.

The third pre-condition for the success of panchayati raj is to train PR members for their new role. PR members today are not trained formally and systematically with the result that they have very limited knowledge about (a) Panchayat Act and its provisions, (b) the objectives and functions of PR bodies, (c) the dynamics of rural society, (d) growth potential of their areas, and (e) skills of planning for overall development of their respective areas. It is necessary to train them if they have to make panchayati raj successful.

And the last pre-condition is about preparing development administration for panchayati raj. First of all, it is necessary that bureaucracy is committed to panchayati raj. PR bodies should be provided with administrative help which has a primary loyalty towards them, and which has the required expertise to support their activities. In this context two suggestions can be made: (1) The double loyalty of the present should end. A new cadre of panchayats should be set up separately for this purpose, and (2) A concept of specialisation should be included in development administration along with a strong component of training. An officer who moves from space to welfare and from tribal development to heavy industries cannot really deliver the goods that are needed.

It should also be added that measures should be taken to protect bureaucracy from undesirable political pressures. Such measures could be strict implementation of transfer rules, upgradation of lower level posts, etc.

III

Proposed Constitutional Amendments: Are These Necessary?

Let us now examine the proposed constitutional amendments in the light of the discussion in the two previous sections. It appears from the speeches of leaders and newspaper reports that the government has felt the need for these amendments mainly because of two reasons: (1) It is felt that state governments are not very enthusiastic about implementing PR in their respective states as they are not prepared to share power with lower level bodies. In fact, it is argued that some state governments have grabbed the power back from PR bodies gradually. There is therefore a need to amend the Constitution to ensure power to PR bodies. (2) Local self-government and panchayati raj bodies are in the state list in the present Constitution, with the result that the centre cannot pass any legislation in these areas unless the constitution is amended for the purpose.

The main provisions of the proposed Constitution (64th) Amendment Bill can be listed as follows:

(1) All states will have three tier panchayati raj system which will include panchayat bodies at village, intermediate and district levels. Small states with less than 20 lakh population may not, however, have the intermediate tier.

(2) Regular mandatory elections will be held every five years for these PR bodies under the control and supervision of the chief election commissioner. If a PR body is dismissed for some reason, it must be reconstituted through a proper election within six months.

(3) All seats in all PR bodies will be through direct elections, and office bearers will be from the directly elected members only. State legislatures may appoint MPs, MLAs and others on PR bodies for their representation in the panchayats.

(4) 30 per cent seats in PR bodies will be reserved for women. Reservation of seats for SC/ST will be in proportion to their population in the total population.

(5) PR bodies will receive their finances from state governments (in the form of grants). They will also be able to earn revenue by imposing taxes, duties, tolls and fees on the commodities falling under their purview. State finance commissions will review the finances of PR bodies every five years.

(6) PR bodies will prepare plans for economic development, social justice and social welfare of their population as per the given guidelines. These plans will be incorporated later on in state plans.

(7) Strict accounting procedures will be laid down to control corruption and misuse of funds by panchayats. Comptroller and Auditor General of India will supervise the accounts.

Some of the provisions of the amendment bill are welcome: Setting up 3 tier (in some cases 2 tier) PR bodies, insistence on regular elections, ensuring finances to PR bodies, involving PR bodies in local level planning, etc, are afterall desirable provisions. One can say that the bill has certain positive points.

The crucial questions, however, are as follows:

(1) Does the bill support and encourage decentralisation of power or decentralisation of decision making at all the levels in the country? In other words, does the bill, which aims at strengthening local self-government in the country, strengthen the position of the governments below the centre, say, the state governments?

(2) Are the proposed amendments capable of removing the weaknesses of the present PR systems in the country? Has the bill identified the important constraints of PR structures in India and attacked them so as to ensure development of panchayati raj in the country? And if not, is the bill accompanied by other steps which will ensure healthy growth of panchayati raj in the economy?

(3) Does the bill fulfil the requirements of Article 40 of the Directive Principles of State Policy of the Constitution? It is argued by the government today that the proposed amendment emerges from this article. But is it really so?

The following paragraphs attempt to reply to these questions:

Decentralisation or Centralisation?

It seems that the proposed bill tends to increase the power of the centre and reduces the same of state governments: First of all, the bill has taken panchayati raj out of the state list and put it in the concurrent list so as to allow the centre to pass legislations in this area. Secondly, the provision of holding panchayat elections under the supervision of the chief election commissioner and not under state government once again gives more powers to the centre. Thirdly, the provision of providing finances to panchayats through the finance commission and not through state government also reduces the power of states. (Giving funds for Jawahar Rozgar Yojana directly to panchayats is indicative of the same trend.) Fourthly, the power of dismissing panchayats now vests with governors, which also increases central control over panchayat bodies. And lastly, the provisions like 30 per cent representation to women, proportionate representation to SC/ST, etc, which are decided at the centre without consulting state governments is another encroachment on powers of state governments.

We think that this amendment goes much more beyond the required level of intervention. This kind of reduction in the power of states and increase in the powers of the centre is an unhealthy trend leading to more and more centralisation in the country. It not only strengthens the present trend of over-centralisation of power but it also endangers the federal character of our union. Also, there is no evidence of the past that suggests that centralisation leads towards more decentralisation at the micro-level. In fact, our experiences in the past suggest that the motives behind this step may not be very healthy. Afterall, the centre that cannot even grant an autonomous TV centre to state governments is hardly likely to share power with lower bodies!

Barking at the Wrong Tree?

We have listed above some pre-conditions for the success of panchayati raj on India on the basis of the past experiences in this area. We have seen that evolving a comprehensive concept of panchayati raj, strengthening the position of the poor, preparing PR members for the new task and some reorganisation of the bureaucracy are some of the important requirements on the foundation of which the superstructure of panchayati raj can be built.

The proposed amendments, however, touch upon only a part of the requirements and does not fulfil the pre-conditions. For example, we do not see much evidence (I mean concrete evidence) of decentralised planning with strong micro-level planning

process in the country. Though a large number of committees (such as Working Group on District Planning, CAARD—Committee for Administrative Arrangements For Rural Development, etc) have recommended strengthening of planning process at district and below district levels, very little has been achieved. Even the newly floated Jawahar Rozgar Yojana is not to be integrated with a sound planning exercise at the micro-level. In short, there is no evidence to suggest that government is evolving a comprehensive concept of panchayati raj encompassing economic, political and welfare dimensions.

It is also worth noting that the proposed amendment takes no notice of the highly exploitative power structures in our rural areas. It completely ignores the fact that the powers of panchayats today are in the hands of those who have not only no concern about the needs of the poor, but who are also exploiting the poor very badly. It also ignores the reality that the poor and highly unorganised masses are in no position to use their vote for their own benefits. Giving them powers without doing anything about the exploitative structure is surely going to be a futile exercise.

We think that the approach adopted in the proposed amendment, is at best partial, which may not serve much purpose.

Article 40

It is argued by the government that the proposed amendment emanates from Article 40 of the Constitution, which as we have seen, was added to the Constitution almost as an after thought. The article says that "the state shall take steps to organise village panchayats and endow them with such powers and authority as may be necessary to enable them to function as units of self-government".

We think that this article does not necessarily call for the proposed amendment in the Constitution. First of all, the word 'state' stands for centre and state both, and when 'local self-government' is a part of the state list, the word 'state' here may mean state government rather than the centre. And secondly, it will be more appropriate to entrust state governments with the development of panchayati raj and to protect autonomy of states than empower the central government with this task if the ultimate objective is decentralisation of power in the country.

Concluding Observations

It is true that panchayati raj structures set up in our country are not doing very well and that there is a need to revitalise them. There is basically a need to evolve a comprehensive concept of panchayati raj which clearly spells out as to what kind of role is expected from it. The othe steps, then, should follow to introduce and develop the new concept.

It is also necessary to get disillusioned about the role of representative participation in the country. It is important to realise that representative participation may not lead to mass participation in our kind of socio-economic power structure. Changing this structure or at least strengthening the position of the poor against exploitation is an important requirement for the success of panchayati raj.

The proposed Constitutional (64th) Amendment Bill, when viewed in this background, is at best a partial and weak attempt to save panchayati raj. We think that it is more likely to be misused by the centre than help the process of decentralisation.

NOTICE

It is hereby notified for the information of the public that **UB Limited** proposes to make an application to the Central Government in the Department of Company Affairs, New Delhi, under Sub-Section (2) of Section 22 of the Monopolies and Restrictive Trade Practices Act, 1969 for approval to the establishment of a new undertaking as a division of the Company. Brief particulars of the proposal are as under:

1.	Name and Address of the Owner of the Undertaking	: **UB Limited** 1, Vittal Mallya Road, Bangalore 560 001
2.	Capital Structure of the Applicant Organisation	: Authorised : Rs. 400 lacs Issued & Fully Paid up : Rs. 400 lacs
3.	Management structure of the Applicant Organisation indicating the names of the Directors, and Manager, if any.	: a. Mr. Vijay Mallya b. Mr. F.W.J. Penn c. Mr. S.V. Divecha d. Mr. S.K. Diwanji e. Mr. Morris Mathias f. Mr. G.S. Ramachandra g. Mr. A.R. Wadia h. Dr. E.O. Baltin
4.	Whether the proposal relates to the establishment of a new undertaking or a new Unit/Division	: New Unit, as a Division of the Company
5.	Location of the New Unit	: Khammam District Andhra Pradesh
6.	Capital Structure of the proposed undertaking	: The proposed undertaking will be a unit of the applicant organisation and therefore will not have a separate capital structure
7.	In case the proposal relates to the production/storage, supply, distribution, marketing or control of any goods, articles, indicate:	
	a. Names of the goods/articles	: Beer
	b. Proposed Licensed Capacity	: 250,000 HL/annum
	c. Estimated Annual Turnover	: Rs. 15.0 Crores
8.	In case the proposal relates to the provision of any service, state the volume of activity in terms of usual measures such as value, income, turnover, etc.	: Not applicable
9.	Cost of the project	: Rs. 10.06 Crores
10.	Scheme of Finance, indicating the amounts to be raised from each source	: Partly from Internal Accruals and the balance by raising Loans and Leasing

Any person interested in the matter may make a representation in quadruplicate to the Secretary, Department of Company Affairs, Government of India, Shastri Bhavan, New Delhi 110 001, within 14 days from the date of publication of this notice, intimating his views on the proposal and indicating the nature of his interest therein.

Inter and Intra Occupational Differences in Income and Level of Living

Manabendu Chattopadhyay
Robin Mukherjee
Ashok Rudra

Using a sample of West Bengal state employees the authors analyse the nature and extent of differences in income, service conditions and levels of living across occupational groups. This is the third in a series of articles aimed at analysing inter- and intra-occupational differences in income and standard of living.

THIS is the third in the sequel of papers with focus on the nature and extent of differences in income, service conditions and level of living of people across different selected occupation groups based on results of a sample survey covering employees in different organisations located in Calcutta. In the first two papers (April 22 and June 10) we presented results pertaining to employees of banks and the LIC and central government offices respectively. The present paper is devoted to an analysis of results for West Bengal state government employees. The motivation for undertaking the present study and the importance of the kind of information being thrown up has already been elaborated upon in the first paper of the series.

I

Survey Design

The sample selection of the state government employees was done by following the same procedure as used for the central government employees. To be precise, we used a two-stage sampling method, in the first stage of which a number of state government offices located in the Calcutta municipal corporation area were selected by the method of simple random sampling without replacement from a list of state government offices prepared from the Calcutta telephone directory. For the selection of second stage sampling units, i e, employees, five lists of workers were prepared from the selected offices. Since our interest was to study the differentials between employees belonging to the occupation groups at the supervisory levels and the clerical cadre, a clear distinction was made between these two groups while preparing the lists. However, observing that both these groups of employees are placed in pay-scales diverging widely even within the group, it was decided to further sharpen our results by dividing each of these groups of employees into sub-groups. Thus, the clerical staff was divided into two groups C and D while the supervisory staff was classified as belonging to group A or group B. The group A workers were further divided into two sub-groups I and II. The classification of these workers into the five groups/sub-groups was made in such a way as to conform, as far as possible, to the classification made for the central government employees.

The stratification of the workers into five groups ensured representation over the whole range of income earners in the respective selected offices. Furthermore, even within each group the workers were arranged in the list according to their date of joining the state government so as to cover workers in the sample having different levels of seniority. In the second stage therefore employees were selected half-samplewise from each of these five lists independently by following the circular systematic sampling procedure. The total number of employees thus selected was 40. The group-wise distribution of sample employees is given in Table 2.

II

Results

Service Conditions

It may be recalled that in our first paper we held out the view that a certain degree

Table 1B: Some Ancillary Receipts and Deductions

II, Employees in the pay scales of Rs 1500-2500 and Rs 1600-2250.
Group B: Employees in the pay scales between Rs 610-1270 and Rs 1100-1900.
Group C: Employees in the pay scales of Rs 425-910 through Rs 550-1470.
Group D: Employees in the pay scales of Rs 230-424 through Rs 380-910.
(ii) In this and all the subsequent tables the index is defined as the ratio of the amount spent on an item by employees in any particular group/sub-group to the amount spent by employees in the lowest group (i e, group D). The figures in brackets indicate ranges.

of inequality is unavoidable whether between occupations or within occupations even under any rigorously worked out and implemented income policy and therefore that degree of inequality has to be regarded as legitimate. It is only that part of the inequality which is more than that legitimate degree which is the subject of our concern. However, it is difficult if not impossible to form any quantitative ideas about that legitimate degree. The importance of our results lies in the fact that they not only throw up estimates of the differentials that exist in the income of people of selected occupation groups but also show how the differentials for the same occupation group vary as the employer changes.

TABLE 1C: OFFICIAL TOURS DURING LAST YEAR

Group C	39654.70 (21313.40-83851.40)	8473.23 (6295.69-20033.23)	0.95	21.27 (0.00-39.62)
Group D	38544.63 (13203.40-107112.40)	8881.25 (2983.03-18878.62)	1.00	58.28 (0.00-86.26)

We have already presented in our two earlier studies estimates on the extent of income differentials between the supervisory and clerical staff in the banks, LIC and central government respectively. While analysing the results for the state government employees one would naturally like to compare the same with those of the other groups particularly with the central government employees.

Our results in Table 1A considered along with the corresponding table in our earlier paper confirm the general belief that the central government employees are better paid than the comparable state government employees though the difference is not at all that very marked. This can be verified by looking at the average income of the comparable groups of workers in the two governments. This is not really a new piece of information. What is much more striking is the fact that income differences within the state government employees are found to be considerably more pronounced than those within the central government employees. While for the central government, the ratio of the average income between the highest and the lowest groups was found to be little over 2.5 that for the state government employees is close to 4.5. Even if we leave out the highest paid employees in the state government (i e, group AI) on the ground they belong to the IAS cadre and are subject to the revised pay scales of the central government, the differential income between the second highest (group AII) and the lowest paid (group CII) workers is considerably more compared with even that between the two extreme groups in the central government.

It may be noted that the figure for ranges associated with individual figures for averages is smaller for state government employees than for the respective figures for central government employees. It can therefore be concluded that the smaller dispersion among the average figures for the state government are not due to sampling fluctuations but represent a smaller dispersion in the population figures.

Both in the central service and state government service, employees having salary below a certain level are paid stipulated amounts as annual bonus. For the state government employees, however, this constitutes an insignificant proportion of their annual income. More interesting information are however, obtained with respect to voluntary deductions and repayment of loans and advances. The percentage of annual gross salary which is 'saved' by way of voluntary

deductions is extremely low for all the groups. This may partly reflect the fact that those who are higher up in the income ladder do not need fancy savings through voluntary deductions excepting for getting income tax deductions, whereas low salaried employees simply cannot afford to go in for large deductions. The corresponding percentages for the central government employees were found to be higher but only marginally.

The same is true of repayment of loans and advances. The proportionate importance of these deductions is a little higher for central government employees than for state government employees and that also probably represents nothing other than somewhat higher salaries enjoyed by state government employees.

Many government officials have to make frequent tours on official work. The figures presented in Table 1C provide some interesting information on various aspects of such tours. The table shows that the frequency of tours and the average amount paid as TA and DA per employee increase progressively as we go up from the lowest to the highest paid employees and this of course is in conformity with our expectation. This pattern was less clear with central government employees. Incidentally the average expenditure on travel of top officials of state government service represents nearly double their monthly salary whereas the factor is 3 for central government service. These figures should permit us to make estimates of the astronomic amounts that are spent on tours by officials.

Family Composition and Family Income

In respect of family composition there seems to be a clear pattern depending on level of income. Lower the income higher seems to be the number of earning members in the family other than the respondent. The employees of the lowest income group, on the other hand, have considerably larger families with as high as 2.31 earners per family. About one-third of these families have more than one male earning members and the same proportion are with working wives. More importantly, in the bottom group more than fifty per cent of the family income is contributed by other members of the family. It would appear that it is, to a large extent, the economic necessity which forces the members to live jointly. There is however, no clear pattern about the incidence of female working members in the family with income level.

A comparison between central and state government employees indicate that the contribution by other members to the

Notes: * The items other than the 8 listed, are radio, VCR, record-player, gas-stove, water-filter, bicycle, motor car, motor-cycle, emergency light, generator, slide projector and sofa set. None of the families in our sample possessed either a motor car or VCR.

family income is generally lower among central government staff. We have seen before that the dispersion in the salary incomes between state government employees is larger than amongst central government employees. This relation remains unchanged when we consider family income instead of salary income of the respondent.

LEVEL OF LIVING DIFFERENCES

While one may expect a reflection of the differences in the family income on the standard of living, our earlier papers in this series indicated that this is not generally true for the occupation groups considered in this study. To be precise, for certain types of expenditure, the relationship between income and level of living is very clear but for some others the correlation is found to be rather weak. This general conclusion remains valid for the families of the present group of respondents as may be noted from the detailed discussion of the results below.

In respect of living accommodation, excepting for employees in group AI, 50 per cent or more of the families live in their own houses. The per capita floor space enjoyed does not seem to bear any direct relationship with income. As far as rental per month for rented house is concerned we observe that it increases with income. The top group consisting of a sample of only two does not conform to the pattern but that is almost certainly due to sample fluctuations.

As to expenditure on transport for going to places of work one is once again faced with weak relation with income. The expenses for the top group for going to places of work is found to be nil. By the hazards of sampling these two sample families have no children staying with them. The respondents themselves use of-

TABLE 7: SAREES

Group D	1.88	13.15 (5.00-30.00)	14.85 (4.00-40.00)

fice cars to go to their places of work. By the hazards of sampling once again some other respondents in our sample live within walking distance of their places of work. All these factors contribute to weakening the relation between expenditure on transport and income which may be expected to be positive.

The influence of income is more clearly noticeable on educational expenses. The average expenditure on education during the last year is seen to increase as we move from employees in group D to group A. In fact the increase becomes exceedingly high particularly towards the upper end with employees of group AI spend many times more than what employees in the lowest group spend. In terms of average expenditure per student also the same thing is observed, though the differential is reduced to some extent. The break up of the educational expenses into the constituent items indicates a very striking pattern. The top and the bottom groups spend overwhelmingly high proportion on 'tuition and other fees' and little on private coaching. As to the highest category the respondents are of advanced age and their children have crossed the school stage as such tuition fees are high and coaching fees low. As to the lowest category, they spend less on coaching as they can afford less.

The state government employees receive no medical reimbursement but a fixed medical allowance every month of the highly impressive sum of Rs 16.10! Employees in group AI on the other hand belong to the central services and 50 per cent of them get reimbursement. This percentage, it should be noted, is significantly higher than that observed earlier for central government employees. More important information are, however, provided by our estimates of the annual family expenditure on medical treatment. No clear pattern of increase with income is observed.

Holiday travel is an item of non-essential expenditure which may therefore be expected to be dependent on income. This may be expected to be all the more so with state government employees who do not benefit from leave travel concession schemes. The data however, show that response to income is high only with employees of group A. With employees of lower categories there is no clear pattern.

Durables however, reveal a pattern conforming to expectations. The number and value of consumer durables turns out to be a sensitive indicator of income level. For the individual items also we find the assertion to be by and large valid. Again one notices that employees of group AI appear to be a class distinctly different from the rest. The differences among the three bottom groups are not sharp and it

TABLE 8: SOME SELECTED NON-FOOD ITEMS OF CONSUMPTION

TABLE 11: CEREMONIAL EXPENDITURE

Category of Employees		Expenses on Ceremonials (During Last 5 Years) Per Family (Rs)	Puja Purchases (Last Year): For Own Family	Puja Purchases (Last Year): For Making Gifts
(1)		(2)	(3)	(4)
Group A:	I	8250.00 (6500.00-10,000.00)	1250.00 (0.00-2500.00)	3000.00 (1000.00-5000.00)
	II	50562.50 (6000.00-1,22,000.00)	1300.00 (300.00-2000.00)	1212.50 (150.00-2200.00)
Group B		10275.00 (0.00-60,000.00)	1314.38 (500.00-2800.00)	612.50 (250.00-1000.00)
Group C		19820.00 (0.00-1,47,500.00)	947.50 (0.00-3000.00)	385.00 (0.00-1500.00)
Group D		15180.16 (0.00-1,07,500.00)	923.75 (0.00-2300.00)	796.56 (0.00-2730.00)

would be justified to treat them as a single homogeneous group for the point of view of consumption aspirations.

The number of sarees possessed per adult female in the families of the respondents again show marked difference only for those belonging to group AI. Among the rest there is no pattern of dependence on income.

The items presented in Table 8 also reveal no pattern of dependence on income. The only comment called for by these items is about the extremely low expenditures incurred on these items which reflects one's valuation of cultural activities. It should be a sobering thought for all those who believe that the Bengali middle class attaches a great deal of value to culture.

The few selected items of food presented in Table 9 reveal a pattern of dependence on income which is normal. The deviation in the case of fish and meat consumption by the top group is obviously a matter of sampling fluctuation. Meat does not seem to be an item of regular consumption for any of the groups. So far as egg is concerned, the averages do not show very high rate of consumption. It should be noticed however that there are families at all levels which consume egg every day. Milk is an item of daily consumption for those belonging to groups A and B. They do spend a substantial amount every month for milk. The average is, however, much higher for group AI employees than the rest.

Employing domestic servants is, as in the earlier cases, seen to be a common feature with these families. Not all families in the poorest group, however, can indulge in such expenditures. The monthly or hourly wage paid to the servants is again found to be abysmally low. Dependence on family income is there but is not very sharp.

Expenses on ceremonials also do not bear any clear relationship with the level of incomes. Festival purchases reveal a clearer dependence pattern, more so for making gifts than for own family.

CONCLUDING OBSERVATIONS

A comparison of the results in the present paper with those in the second in the series confirm the generally held impression that central government employees are better off than the state government employees in terms of salary income. But the difference is marginal and gets even further dampened when we pass on to family income or level of living.

It was argued in the earlier papers that variations in expenditure on various items cannot always be explained in terms of variations in income. It was suggested that it is possible to demarcate some large income ranges within which the level of expenditure on many items are insensitive to variations in income. Our results for state government employees lend further support to this hypothesis.

Looking at the inter-occupational differences within the state government (that is, differences between the different categories into which they were divided), it is seen that employees in group AI, who are really the central government employees, are way above the rest not only in terms of salary income but also in many other respects. Judging by expenditure habits, employees of groups C and D seem to constitute a more or less homogeneous group. The homogeneity extends to include the group B workers for certain items of expenditure.

Sickness in Indian Textile Industry

Bagaram Tulpule

PRAFUL ANUBHAI (July 8) rejects percentage of workers displaced as an indicator of sickness and alleges that I am relying on that percentage in questioning his proposition that the composite mill sector is more affected by sickness than the spinning sector.

I believe that tens of thousands of workers being thrown out on the streets is the most dire consequence of industries going sick and closing down. Hence, I do not see anything wrong in taking the percentage of displaced workers as an indicator of the extent of sickness. I do not agree that proportion of capacity rendered idle is necessarily a more correct indicator. I give greater weight to the human consequences of industrial sickness than to the inert ones.

Anubhai further asserts that the proportion of displaced workers is higher in the spinning sector than in the composite sector because the closed spinning mills were overstaffed. That may be so. But it only explains the sickness; does not alter the fact of sickness of these closed spinning mills. For that matter, causes can, and indeed are, attributed for the sickness of the closed composite mills also, but they too will not alter the fact of the closure of these mills.

I do maintain that comparison of idle spindlages in the two sectors would be misleading since idle spindlage in a composite mill may be only a consequence of sickness of the whole mill and not indicative of the spinning operation itself being unremunerative.

So far as profitability is concerned, the ATIRA finding quoted by Anubhai that performance of spinning mills has been "relatively better" than composite mills may be accepted.

Anubhai's proposition that temporary idle capacity in powerlooms involves very "low cost" is difficult to agree with. When the idleness is of the order of about 67 per cent of the total, to say that "no overheads are incurred" is astonishing. Do the looms and their installation come for free? Are no interest and rent payable? And so far as not paying workers is concerned, have not many composite mills too defaulted in the payment of even earned wages, not to speak of idle time wages, and dues deducted against provident fund and employees' state insurance?

Operating costs of powerlooms are admittedly lower compared to looms in composite mills although there may be differences about how much lower. Regarding cost of yarn, even ATIRA grants an advantage to the composite mills of as much as 10.4 per cent which is not vastly below my own estimate of 12 per cent. Overall, cotton cloth woven on powerloom may indeed be cheaper by 5-10 per cent as ATIRA finds. But this advantage can be more than neutralised by other relative advantages enjoyed by the composite mills: cheaper bank credit, strong market presence, greater bargaining strength, higher technological expertise, better quality control, and so on.

According to Anubhai, even when cotton prices fell quite sharply, the industry could not produce more due to "emergence of large number of spinning mills and more cost effective powerloom sector". But composite mills' own cost of production could have come down if they had produced more which would have meant better utilisation of capacity and lower unit overhead costs. Neither the emergence of new spinning mills nor the cost effectiveness of powerlooms explains the fact that composite mills produced not more but less when cotton prices were falling.

Then, of course, we have the familiar argument that when cotton prices rise, cloth prices also rise, but when cotton prices fall, then also cloth prices rise because prices of other inputs rise. But let us look at this a little more closely. Reading Anubhai's Tables 10 and 11 together, we find that between 1984-85 and 1986-87, cotton prices fell by about 30 per cent which would bring down cloth costs by 12 per cent. On the other hand, during the same period prices of power and fuel rose by about 20 per cent, those of dyestuffs and chemicals by about 15 per cent and of stores and spares by about 17 per cent. All these three groups together would, therefore, raise costs by about 4.5 per cent. Assuming average wages to have risen by as much as 20 per cent over the period, that would add about 4.6 per cent to costs. All these together would mean a cost increase of about 9.1 per cent against a cost decrease due to lower cotton prices, a net advantage of 2.9 per cent. Yet, cloth prices, far from coming down, actually went up by over 5 per cent over the same period. Were the powerlooms or the emergence of large number of spinning mills to blame for this?

Regarding locational differentials, my main point was that states which together account for less than 10 per cent of productive capacity cannot be serious competitors to the incomparably larger centres regardless of substantial differences in costs of production. The locational shifts Anubhai is talking about, if at all they occur, will take long and involve heavy costs of their own, apart from the fact that if and when significantly large capacities are set up in these presently low-cost states, their costs also will inevitably go up.

Regarding the financial data presented in Anubhai's Table 21, I never took it as presented "sector-wise". I took it as representative of the entire industry since it had not been qualified in any other way. If it is representative of both private and public sectors together, as appeared to be the case on the face of it, then I do not know how my observation quoted by Anubhai can be called "misplaced". If the financial performance of one of the two sectors is worse than the combined performance, then the performance of the other sector must necessarily be correspondingly better than the combined performance. My observation could be faulted only if the sample covered by Table 21 was exclusively from the private sector and was stated to be so in the first instance.

I must confess that my statement about the value of imports of textile machinery was an error and I regret it.

About the importance to be given to exports and making the textile industry internationally competitive for that purpose, I have stated my views at length. I am aware that these views are not fashionable currently, but I hold them after full deliberation. I do not "reject the export potential of Indian industry" as Anubhai alleges. What I question is the wisdom of laying excessive stress on exports.

My doubts about accuracy of export statistics persist. According to Anubhai, "It appears that in Pakistan production of cloth in the decentralised sector is 8 to 10 times that of the organised sector". Even he is not sure. There is little evidence for this. The ICMF *Handbook of Statistics* says that there are "approximately 50,000 powerlooms in the decentralised sector" while in the organised sector there are 20,000 automatic shuttle looms and 3,000 shuttleless looms. Where from does the "8 to 10 times" output of the decentralised sector come? From handlooms? In that quantity? And does that account for the surplus of exports over the output of the organised sector? Would our own very considerable experience with handlooms warrant such a conclusion?

For yarn production too, I remain unconvinced that the factors listed by Anubhai can result in doubling of per spindle output. Our own spinning capacity is reasonably modernised, much of it is fairly new, and there is no reason to assume that its productivity is so poor in comparison with Pakistan's. Our utilisation was of the order of 70 to 75 per cent on a 3-shift basis in 1984 (ICMF *Handbook of Statistics*). About 60 per cent of the yarn spun was 30s and below, over 85 per cent, 40s and below. So neither higher utilisation nor productivity nor coarser counts could explain the yarn output per spindle in Pakistan being more than twice that in India.

The different sets of statistics, thus, do not appear to be mutually consistent. On the cotton balance now cited by Anubhai, I am not in a position to comment, but would invite attention to the fact that figures of export of yarn and fabrics given in the cotton balance differ considerably for those in the ICMF *Handbook of Statistics*. Which are to be relied upon and why?

"Is production capacity inflexible?" asks

Anubhai in the context of his plea for free exports of cotton yarn. One real limiting factor, of course, is availability of cotton in which we hardly have a large margin. But the more important question is: whatever increase in yarn output is achieved, should it go to exports rather than to satisfy the demand of our own weaving capacity which is large enough to absorb all the yarn we can coceivably produce in the foreseeable future. There is nothing "wrong in exports" as such, but everything wrong if exports are at the cost of starving our own loomage in the decentralised sector.

Earlier in his reply, Anubhai has stressed how the composite mills have to compete, and that on unequal terms, with the low-cost powerloom sector. If this is not sufficient pressure for the mill sector to take "a hard-headed look" at its costs, how will the slogan of becoming "internationally competitive" induce it to do so?

If Anubhai had read my piece carefully, he would have seen that I did not make any "a priori judgments" on the choice of technology but tried to spell out the considerations, primarily unit cost of production, that should guide the choice. Nor have I made any "sweeping generalisation" that all choices of technology have been wrong. My use of "choices" in plural should make it clear that I did not speak of one across-the-board choice, but viewed the choices selectively, some of which, especially some involving the "latest technology", have been, in my view, wrong, since they have not helped the concerned mills to reduce costs.

I am glad to note that although Anubhai begins this para by charging me with having made a sweeping generalisation, he ends it by agreeing that if modernisation is attempted without fully relating it to products and economies of operation, it could lead to disasters.

This is not the occasion to enter into an ideological debate on the place of profits in socially desirable activity. Anubhai and I are not likely to agree on this question. What is happening in the USSR is hardly relevant here. In an excessively centralised economy and regimented society as USSR was till recently, the corrective naturally had to be in the direction of opening up. But in an economy and polity which, despite all talk of planning, are almost chaotic, the corrective has to be in the opposite direction. The most recent events in China raise doubts about how much we really know about what is happening there. Nowhere in my piece did I suggest shutting market forces out. I was focusing on the anomaly that a country so favourably endowed in the field of textiles should find its textile industry, the largest and oldest in the country, in the doldrums. It is my conviction that an alternative strategy in dealing with it is feasible and desirable, and I made an effort to sketch it in outline.

Women Studies in India

Neera Desai
Maithreyi Krishnaraj

ASHOK RUDRA, it appears, has chosen to use his review of *Women and Society in India* (April 29) really to launch an attack on women studies. According to him, women studies in India is nothing but shoddy research and hack-writing and no 'heroic' attempt can salvage it. There are also several inaccuracies in his references to sections in the book but we will confine our reply to his general criticisms.

First let us clear one or two points. Rudra faults us on two counts simultaneously—for failing to live up to a claim we are supposed to have made and also for not having made such a claim. A text-book does not need to propound a theory. It usually presents different points of view and alternative theories that are current. To compare a text-book with Betty Friedan's polemical tract is to equate two non-comparable categories. If at all a comparison was in order, it should have been with a women studies text used in the west and there are several of them. The 'feminist perspective' in the book lies in the departure from the earlier humanistic arguments to a focus on women's own specific needs and interests. The Indian education system being what it is, there was need to put available material in one place and that is all we tried to do. It is not true that there is no serious, analytical work. The book under review draws primarily on articles in journals acknowledged to be of some standard. It is a step in the direction of better understanding, if not a full-fledged theory. It is incorrect to allege that it is the introduction of women studies by UGC in the universities that has given rise to a 'spate' of shoddy writing. The UGC has stepped in just two or three years ago and todate there is hardly any university which has a full-fledged women studies course. There is a paper in some discipline or the other in three or four places, not sufficient to evoke such a flood of hack-writers. Serious work by a dozen or so good scholars began in the late seventies when women studies had neither acquired a nomenclature nor much legitimacy. It is the effort of these early scholars and the interesting issues they have opened up that have induced a few mainstream academics to sit up and take notice and a few of them have since engaged in women studies research, when a decade ago they would have spurned it as not worthy of their attention.

To come now to the more substantive issues raised by the reviewer—that women studies in India lacks a theoretical framework, that it has failed to isolate the oppression of women *qua* women and lastly that Indian scholars refuse to learn from western feminists out of a bigoted cultural chauvinism.

Rudra obviously has not been in touch with what has been happening. From the late seventies and more particularly the early eighties there has been considerable cross cultural anthropological work, which has been highly critical of the narrowness of the western feminist formulations, their ethnocentricity and their class bias. Women of colour in the west have formed their own organisations and have found the American (or European) feminist theories unaccommodative of class and race questions. There is general disenchantment with a universalistic theory. Isn't it strange that at precisely a time when western feminists face serious criticism for universalisation based on their limited experience, Rudra should pull us up for not adopting their theories? There is much to learn from them and we owe to them the use of patriarchy as an analytical category. The book in question has this as the underlying theme. It is now commonly accepted that the three basic ingredients of patriarchy are control of women through control of their sexuality, reproduction and labour. The manifestations of patriarchy in each culture/society/time may be different. It has a historicity but much work needs to be done to provide the linkages. To provide an integrated theory, one needs input from several sources. In fact within the west there are several strands of feminism and corresponding theories.

As for our inability to separate poverty from gender oppression, in third world countries it is not easy to make this separation. Feminists in India hitherto have been accused by the left of being bourgeois and of being western (epithets that occur repeatedly as abuse) and now Rudra finds us wanting for the opposite reason. The emphasis on the poor is not misplaced. It is precisely the study of poor women that has helped to highlight the specific oppression of women. In recent years, the discussion on unpaid work of women, their role in subsistence production and their lack of control over the products of their labour *within the household* have brought out very poignantly that invisibility is a mechanism for devaluation and hence subordination. Unlike class relations, a woman's position in the family is simultaneously one of complementarity and conflict. To the extent that a woman's survival depends on the survival of the household, her interest appears to coincide with that of the household. The large number of abandoned women as well as the perpetual threat of disownment breaks the illusion of complementarity. Everyone depends on the woman but she cannot in effect depend on anyone. As for women of upper classes, not only do they enjoy privileges accruing to them as members of their class—and therefore privileges *vis-a-vis* other women—but they also share in the general oppression of women. They have some resources atleast of education to fall back on. The poor and illiterate are the majority of women in India, and a feminism that does not seek to liberate them cannot work towards the liberation of all women. This is different from saying that the gender issue should be subsumed under other issues. Nor are we saying that *only* poor women should be studied. The relative emphasis is justified.

Printed by Krishna Raj at Modern Arts and Industries, 151, A-Z Industrial Estate, Ganpatrao Kadam Marg, Lower Parel, Bombay 400 013 and published by him for Sameeksha Trust from Hitkari House, 284, Shahid Bhagatsingh Road, Bombay 400 038

FASHION TIMES

AN EXCITING ISSUE BY DCL POLYESTERS LTD.

Worldwide trend of Polyester

It's the age of polyester blends. People the world over, are switching to fabrics made of Polyester Filament Yarn (PFY). Indeed, Polyester Filament Yarn has emerged as the most sought after man-made fibre, worldwide.

Polyester Filament Yarn – popularity and prospects

Production of Polyester Filament Yarn has increased from just 9250 tonnes in 1980 to about 1,38,000 tonnes in 1988. The demand supply gap is ever increasing, promising a bright future for PFY.

DCL's Prestigeous Project

The demand for polyester outstrips the supply – there are not many manufacturers of Polyester Filament Yarn in India. Now comes DCL Polyesters Limited (DCLP), a 15,000 tpa project near Nagpur – promoted by Deccan Cements Limited and DCL Finance Limited successful dividend paying Companies with equity participation from ADB, Manila, EMS Inventa AG, Switzerland, KREIC Kuwait and SICOM. A big project in a growing field – set to create quality PFY, including innovative speciality yarns. Tata Projects Limited, a renowned consultancy organisation, is extending design engineering services.

Only a few other manufacturers of Polyester Filament Yarn are in India. To name but a few:

Name of the Company	Face value of equity share (Rs.)	Market value as on 21.6.89 (Rs.)
Century Enka Ltd.	100	2690
Reliance Industries Ltd.	10	125
J.K. Synthetics Ltd.	10	75

"Inventive" technology from "Inventa" – Switzerland

EMS Inventa AG, Switzerland – responsible for creation of over 7 lakh tonnes of Polyester Filament Yarn capacities through 70 plants worldwide. EMS Inventa will not only provide DCLP latest technology incorporating continuous polycondensation and high speed direct spinning process to produce quality yarn with flexibility to use either PTA or DMT, but also invest Rs.188.75 lakhs in the equity share capital.

EMS

DCL POLYESTERS LIMITED

SF-2 Uday Apartments, 4, Vijaynagar, Chaaoni, Nagpur 400 013

Confidence of Investment Institutions

The preference for PFY – the exciting prospects of DCLP, is reflected, rightly so with investment of Rs. 150 lakhs by SBI Mutual Fund, Rs. 50 lakhs by Canbank Mutual Fund and Rs. 100 lakhs by Unit Trust of India in the Public Equity Issue.

Public Issue of 1,28,50,000 Equity Shares of Rs. 10/- each for cash at par aggregating Rs. 1,285 lakhs.

Education and Society

Two movements in human resource development occupy the centre-stage today in most developing countries: One the old movement for the still remote goal of universal literacy and the other a comparatively new movement for scientific modernisation of society. The two movements are proceeding in their respective 'self-reliant' ways, whereas in fact literacy and modernisation are conceptually interrelated and, therefore, their pursuit should be interdependent. 1711

Can an endogenous system of transmission of knowledge and competence be evolved which critically questions and mobilises to action in the very process of transmitting accumulated human reflection on the socio-economic context of people's relation with their environment? A study of the efforts of non-party political groups in Thane district in Maharashtra to evolve educational programmes in the context of the democratic struggle and in tune with the felt-needs of the adivasis. PE-54

Communal differentiation as rooted in the realm of cultural identity must be taken into account as an autonomous reality, particularly in dealing with education. The relation between educational development and communal politics in Bengal in the context of the Bengal Secondary Education Bill, 1940. PE-81

Class and Consciousness

While it is important to study counter-hegemonic protest movements and revolts, it must be recognised that the dominant reality is one of the subaltern classes accepting the hegemony of the elite through such processes as deference to the elites and emulation of elite values. An exploration into subaltern consciousness while under hegemony through the study of the popularity enjoyed by the late M G Ramachandran among the people of Tamil Nadu. PE-62

In discussions of the involvement of social, religious and occupational groups in communal riots, it has been argued that the working class has been as much responsible for contributing to the dynamics of communal politics. But a study of the 1893 communal riots in Bombay city shows that while strong communal sentiments did exist among the workers, that did not lead to the development of a long-term communal consciousness among them. Nor was it the most representative form of their activities. PE-69

Debate on Narmada

If the central government really believes in democracy and in giving power to the people through panchayati raj, it must come out with a white paper on the Narmada Valley Project, give it wide publicity and have it debated openly. 1687

Road to Tiananmen

For many years there have been clear lines of political conflict in China. Two views of the forces leading up to the Tiananmen demonstration and its brutal suppression. 1696, 1697

Kashmir Policy

The present situation in Kashmir does not leave any room for doubt that the avowed objective of the Rajiv Gandhi-Farooq Abdullah accord of fighting anti-national and communal forces has not been achieved. In fact the current situation can be shown to be a logical consequence of the accord 1689

Workers Losing

Large companies in India have not experienced any secular decline in the rate of profit, although they might have seen cyclical variations. The explanation for this steady trend lies in the falling share of wages and salaries in value added, which also suggests the existence of objective grounds for sharpening of class conflict. PE-95

India and Perestroika

India offers a test case for Gorbachev in restructuring the Soviet Union's economic relations with the developing countries in keeping with his policy of perestroika. 1717

Shaky Case

Critical examination of the theoretical rationale underlying the argument advocating a 'liberal' trade regime for underdeveloped countries which has made a strong reappearance in recent years. PE-91

The focus of the World Bank's *World Development Report 1989* is the need for more liberal and open financial systems in the developing countries. How convincing is the World Bank's case? 1691

Jews, Israel and Palestine

RINA NISSIM (June 3) after acknowledging that "the creation of the state of Israel has been at the root of the deportation and oppression of the Palestinians" proceeds curiously to argue that "the formation of Israel is not very much more artificial than the creation of many other states". In our century, however, there is *no* other state created on land where the residing inhabitants were forced to flee, those remaining behind reduced in their own homeland to a "tolerated but essentially foreign element" ruled under military law for 18 years, their land seized, their travel restricted, etc. It is disingenuous to compare Palestinian refugees in the Arab world with Muslims who migrated to Pakistan. The Arab countries and the Palestinians did not *want* Palestine to be partitioned. Rather the partition was imposed by the Great Powers.

The three books I reviewed (April 22) dealt with the history of the birth of Israel and not the subsequent Palestinian diaspora. The question of violence inflicted on Palestinians by Jordan and Syria was therefore not relevant to the subject under review. I do not know how Nissim decided that "it is well known that the Israeli Palestinians have done much better than those of the camps". Available facts tell a different story. For instance, university enrolment of Palestinians in Israel was the lowest at 316/100,000 compared to 464/100,000 in the West Bank, 660/100,000 in Jordan, 711/100,000 in Saudi Arabia and 1904/100,000 in Syria. Also Palestinian men are more likely to occupy professional, technical and administrative positions in Saudi Arabia (40 per cent), Kuwait (22 per cent), Syria (11 per cent) or Jordan (10 per cent) than in Israel (8 per cent).

Yes, a peace movement does exist in Israel. Courageous Israelis like Felicia Langer, a dedicated lawyer, survivor of the Holocaust, and Israel Shahak chairperson, Israeli League for Human and Civil Rights, to name two prominent individuals, have fought long and hard for Palestinian rights. Also Israeli groups like Women's Organisation for Women Political Prisoners and Yesh Gvul ('There Is a Limit') are actively involved in resisting Israeli policies towards Palestinians.

India, which contrary to Nissim's assertion recognised Israel in 1949, should endeavour to convince Israel and the United States that a two-state solution in the region offers the best chance for peace. The Intifada has created conditions for a just and lasting settlement which must be pursued vigorously if the sorry history of the past 40 years is not to be repeated.

Carbide Quit India Week

AT the 'National Convention on the Bhopal Settlement' convened by our organisation in Bhopal on April 15-16, 1989, a number of resolutions were passed about the action programme to carry on the struggle against the collusive settlement between Union Carbide Corporation and the government of India. Representatives from various solidarity organisations from different parts of the country had jointly drawn up the plans for these activities and national representatives of opposition political parties had expressed their commitment to the programme.

Following up on the convention and as a part of the continuing struggle, we now propose to observe the week from August 9 to 15 as 'Union Carbide Quit India' week. It needs to be mentioned that the Quit India movement against the British imperialists was launched on August 9, 1942. The ever growing influence of foreign capital on the policies and priorities of the Indian government and its tragic consequences as illustrated in Bhopal make the movement of 1942 extremely relevant to the Indian people today. In addition to the outrageous settlement, the fact that even after perpetrating the greatest industrial genocide of the century, Union Carbide continues with its business in this country bears testimony to the collusive nature of the Indian state.

Our demands for the protest week are:

(i) Union Carbide be prohibited from continuing with its business in India and all industries owned by the killer multinational be handed over to the workers who work in them.

(ii) Union Carbide be disallowed to market its products and the All-India Radio and Doordarshan should immediately stop advertising Union Carbide products, particularly Eveready batteries.

(iii) The Bhopal pesticide plant be replaced by a national memorial on the Bhopal Gas Disaster and industrial projects be set up there for providing alternative employment in accordance with the reduced working capacity of the gas-affected people.

(iv) The Research and Development facility of Union Carbide at Bhopal which has always been functioning under a shadow of suspicion should cease its activities.

In Bhopal on August 9 we plan to march to the Research and Development centre to press our demand of closing it down. We will be organising meetings and demonstrations on other days of the week, highlighting the sufferings caused by Union Carbide, the betrayal of the Indian government and the unjust settlement.

ECONOMIC AND POLITICAL WEEKLY

Finance Commission and the States

THE state finance ministers, summoned to a meeting in Delhi by the Ninth Finance Commission, made known their apprehensions that the commission's zero deficit target for 1994-95 was impractical and, worse, was also perhaps a ruse to deny to the states their due share of central revenues. While the chairman, known not only for his penchant for hyperbole but also for the mental block he suffers from in regard to economic logic, stuck to his guns that there could be no compromise on the zero deficit target, the rest of the commission, truncated as it is for the present, appeared to be much more flexible. In any case, it was all but conceded that the states' share of central revenues could not be permitted to go down.

However, on whether the weight of tax devolution in total central transfers should be reduced and that of grants correspondingly raised, the states were unable to get a clear commitment from the commission, even though practically every state, rich as well as poor, opposed any reduction in tax devolution. The commission's background note did not convince the states that the purpose of equity could not be adequately served through appropriate changes in the formula for distribution of the amount of tax devolution among the states. On the other hand, the states' memory is not as short as the commission seems to assume. Most states, some exceptions like Maharashtra apart, are still smarting under the impact of the commission's award for 1989-90, which used grants for largely arbitrary and inequitous purposes. How could this commission be taken at its word when it professed to use grants for purposes of equalisation? Or is it that the commission has its own ideas on what equalisation means? In its first report the commission had recommended grants totalling Rs 200 crore for states identified as backward in elementary school enrolment and even Haryana—a high income, revenue surplus state—qualified for the grant.

There was also the related question of special category states, devolution to whom is mostly, though not altogether, in the form of grants. In the commission's award for 1989-90, the share of these states in total transfers (tax devolution plus grants) was allowed to go up from 6.6 per cent under the Eighth Finance Commission's award to over 10 per cent. It has to be remembered in this context that these special category states—not including Assam—account for less than 2.5 per cent of the country's population. The major states, poor as well as rich, are naturally worried that their share of the kitty will go down as the transfers to special category states go up. And their fears are not totally without basis. The special category states have submitted a common memorandum to the commission asking for still larger transfers to them. Already in per capita terms devolutions to these states through Finance Commission transfers alone are three times as high as those to the major states. To meet the special category states' clamour for still larger transfers to them, there will have to be greater recourse to grants as compared to tax devolution. Thus the demand of the special category states is music to the commission's ears since it supports the commission's own objective of increasing the weightage of grants in total devolution from the centre to the states. But then the other states have real cause for worry.

Not that the other states would grudge larger transfers to the special category states, but why does it have to be at their expense? After all these states were created in special circumstances and in the national interest. Should not any excess transfers to them be considered a charge on central revenues? The Finance Commission owes a full explanation to the public since it seems to be in favour of considerably larger devolutions to these states.

Quite a good part of the commission's meeting with the state finance ministers was devoted, it would appear, to discussion of the sort of normative approach the commission proposes to adopt for assessment of the revenues and the expenditure needs of the centre and the states. There was virtual unanimity among the states in objecting to the commission's assumption that the centre's tax revenues would grow at the same rate as those of the states. If the centre has not performed well enough in fact, it is not because the tax sources at its command do not have the potential but because if has been slack. The states, on the other hand, are being forced to scrape the bottom of their tax barrels. By making an assumption like this the centre was being let off lightly and the states forced to over-extend themselves. Some states also raised questions regarding the commission's assessment of the centre's expenditure needs.

No less concerned were the states about the failure of the commission's methodology to take note of the special features of different states in the application of its normative yardsticks for assessment of the states' revenue and expenditure to work out revenue gaps, if any. Nor were the states happy with the norms proposed for public utilities and other public sector undertakings. The experience with norms set by earlier commissions has shown clearly the futility of such unrealistic targeting.

Whether or not the discussions with the states served at all to bring the Finance Commission down to earth and see the reality for what it is will have to await its final report to be revealed, but the commission will not have the alibi that the states had not made their views clear.

POLITICS

Muscle-Flexing for Elections

A PREMONITION of the violence which will mark the coming general elections should be recognised from the preparations going on inside the Congress(I) camp. Notorious gangsters and hoodlums are not only being led along the war-path to break up opposition meetings (as happened recently in the Delhi University, when NSUI members stormed a meeting addressed by E M S Namboodiripad and beat up SFI students), but are being catapulted to positions of leadership to prepare them to become candidates in the elections.

In Bihar, two known 'dadas'—Kali Prasad Pandey and Nagina Rai—have been recently admitted into the folds of the Congress(I). The former, an Independent MP, refused to resign from the Lok Sabha along with the opposition members and pledged his loyalty to Rajiv Gandhi—a gesture which earned him the reward of membership of the Congress(I) and will possibly get him a ticket in the coming polls. In order to maintain the balance in the caste-ridden politics of Bihar, the Congress(I) high command has at the same time admitted Nagina Rai, one of Pandey's rivals who belongs to a different caste. Gang warfare between the two had for years disrupted life in Gopalganj in western Bihar. Tensions are bound to mount on the eve of the elections as both with their respective goons will try to demonstrate their might in a bid to impress the high command with their power to terrorise the voters—the only power that counts with the Congress(I) in winning elections.

In neighbouring Uttar Pradesh, which has a crucial importance in the parliamentary elections having the largest chunk of seats among all states in the Lok Sabha and being the home state of most of the Congress prime ministers till now, smugglers, drug pedlars, gangsters and history-sheeters of various sorts are not only being patronised by the Congress(I) state and union ministers, some among them have even wormed their way into the portals of the UP assembly. It is estimated that at least 18 Congress(I) MLAs are known to be directly involved in criminal activities. While one minister is named in police records for illegal cultivation of poppy, another is known in police records as 'Black Cobra'. It is a common practice in UP to release criminals enjoying ministerial patronage on the eve of any election in order to use their services to terrorise the voters. During the last by-election in Allahabad, the notorious history-sheeter Bhukkal Maharaj was let out from jail to campaign for Sunil Shastri against V P Singh. Many more are likely to be given 'amnesty' with the approaching elections.

In opposition-ruled states, the Congress(I) leaders and their followers are quite openly instigating violence. In West Bengal, the irrepressible Ghani Khan Chowdhury has asked the Congress(I) ranks to pick up guns, sten guns, stones and lathis to wage a 'total revolution' against the CPI(M)-led regime. In Tripura, not satisfied with ousting the Left Front government through dubious means, the Congress(I) still continues bloody reprisals against the cadres of the left parties.

While one does not expect Gandhian non-violence from the Congress(I), one feels sad when the opposition parties too get trapped in the race for acquiring muscle power and try to emulate the Congress(I). The nexus between opposition leaders and a section of the underworld in places like UP and Bihar is well known. The Janata Dal leaders are known to have a soft corner for a Dhanbad mafia don. In West Bengal, an infamous gangster Hemen Mandal is being seen around in the company of a CPI(M) minister. In the fluid political situation prevailing on the eve of the elections, mercenaries from the underworld are not only offering their skills to the highest bidder, but are also taking care to choose their patrons with an eye on the fortunes of the candidates in the coming elections.

FINANCE COMMISSION

Credibility in Question

A Correspondent writes:

"THAT Charlie sitting as CAG" has brought "the single greatest indignity on the audit profession", observed N K P Salve in parliament while leading his party's attack on the Comptroller and Auditor General's report on the Bofors deal.

Let us forget the occasion which prompted the above remark. Let us forget also that the remark was not objected to by the presiding officer of the Rajya Sabha. Let us concentrate on the person making the observation. He is no ordinary member of the Rajya Sabha. He is none other than the chairman of the Ninth Finance Commission, a body which derives its authority and mandate from the Constitution. And he has chosen to question the bona fides of a person holding another office which too derives its mandate and authority from the Constitution. In fact this latter office was considered so very important by the makers of the Constitution that a person once appointed to it must forswear all official positions on retirement, an obligation which is not imposed even on judges of the Supreme Court. Also, the CAG can be removed from office only by impeachment. Salve debases his own office by attempting to throw mud at the CAG and that too in a forum where the CAG cannot defend himself.

But the chairmanships of the Finance Commission is no ordinary office either. Not only does it derive its authority from the Constitution, but also the function of the commission is such that its chairman and members are expected to bring to bear on their task a sense of utmost objectivity combined with fairness and impartiality. The requirement of impartiality gains added importance in view of the fact that the commission has to make recommendations on the sharing of revenues between the centre and the states and among the states—in a situation with different political parties ruling at the centre and in some of the major states.

Doubts have been raised in these columns in the past about not only the competence of Salve to hold the office of chairman of the Finance Commission—his public statements soon after assuming office made one wonder if he really understood the job to which he had been appointed for he spoke more like a mofussil auditor—but also about his impartiality on the grounds that he was too active in Congress(I) politics and was clearly an aspirant for higher positions in the party. It was wrong to have a person preside over a quasi-judicial constitutional body such as the Finance Commission and at the same time function as deputy leader of his party in the Rajya Sabha.

These apprehensions have been fully confirmed by Salve's latest performance in parliament. If in his enthusiasm to protect his political boss from the indictment in the CAG's report he can throw all decency to the winds and cast aspersions on the professional integrity of the person holding the CAG's office, how can Salve be depended upon to perform his task as chairman of the Finance Commission with impartiality?

Already the strongest criticism against the Ninth Finance Commission's First Report is that it is heavily biased against the non-Congress(I) states and favours some of the richer states, Maharashtra in particular. Will the commission be less biased when it submits its final report? This is a question which must now be worrying many—and very justifiably so.

It would thus appear that if the commission's reputation has to be saved, it should be given a new chairman. Nothing in the Constitution prevents the president from replacing the chairman of the Finance Commission midstream. Otherwise the states may have to consider the option of approaching the president for the appointment of a new Finance Commission after the Salve commission has submitted its award.

PANCHAYATI RAJ

The Real Issue

THOUGH he never pretended to be a revolutionary and only at the fag end of his life toyed with the idea of joining a socialist party—he had rounds of discussion with Lohia and his emissaries—the late B R Ambedkar, because of his close identification with the most downtrodden masses of the Indian society, sometimes displayed a deeper insight into the socio-political reality than many radicals. "Thank god," he once remarked, "the Indian Constitution did not adopt the Indian village as the base of the constitutional pyramid of autonomous administrative units with their own judiciary, legislature and executive." Obviously, he was fully aware of the fact that given such authority, real power in the countryside would be monopolised by the rural elite formed by the upper classes and castes. This question has assumed topicality because of the Panchayat Bill tabled by the union government in the last session of parliament.

Even if there be provisions for the reservation of some seats for the scheduled castes, scheduled tribes and women in the proposed law, real power is unlikely to devolve upon the impoverished and marginalised masses until and unless the grip of the landholding and affluent patriarchal bosses are loosened.

In their campaigns against Rajiv Gandhi's bill the opposition parties are mainly harping on implications of the bill for the state governments' range of powers. That the new law would squeeze the extent of the state's autonomy is not untrue. But is this argument very likely to move the rural masses to oppose the Congress(I) government's proposals? Hardly. The powers in the hands of the state governments have been seen by the rural poor to be deployed in most cases against the interests of the landless, the dalits and the poor tribals.

If the opposition wants to secure the support of the rural masses, it has to carry Ambedkar's message on the panchayats to the countryside and demand a thorough redistribution of land, along with the reservation of seats. Indeed, Rajiv Gandhi's new panchayat bill has brought in a new opportunity for opening up the question of agrarian democratisation in a big way. But the opposition in most states being what it is—a conglomeration of vested interests with bases in the countryside—will not rake up the issue of rural reconstruction on a radical basis, unless compelled by irresistible circumstances. Maybe, the left in the 'left and democratic' combination will take the initiative in this field.

THE POLICE

Disappearance after Arrest

THE state organises and sponsors terrorism in order to contain political dissent, and polices the people, ostensibly in the national interest. The ovine majority in parliament arms the executive with extraordinary powers, which are excluded from the ambit of judicial vigilance. Detenus mysteriously disappear from police custody, and the executive, on the few occasions of judicial reprimand, is guilty of contempt of court. The judiciary too periodically displays contempt for the law and, to crown it all, the law itself, in some of its provisions, expresses contempt for the people. It is this that sets apart the truth about our fragile democracy from the masquerade of formal, institutional trappings and lofty constitutional verbiage.

The recent report of Amnesty International (AI) which describes nine instances of custodial disappearances (two of these were subsequently resolved) is a further revelation of the systematic erosion of democratic rights in the country. On April 6, 1987 four men were lifted from different villages in Uttar Pradesh by special personnel of South Delhi's Lajpat Nagar police station and have not been seen since. Police, in response to persistent enquiries by relatives, denied having ever arrested them and the Delhi high court accepted the statement *prima facie*, without ensuring that relatives of the victims were summoned to provide evidence. A similar denial was issued by the Punjab police regarding three men arrested in January 1988 from various parts of the state. In the case of the president of the Youth Akali Dal, who surrendered to the director general of Punjab police in October 1988 following harassment of his relatives by the police, the customary denial was initially issued before he was finally released in November 1988, in the face of mounting public pressure. In Bangalore, the secretary of the Karnataka state unit of the Progressive Youth Centre was abducted by plain clothesmen of Karnataka and the Tamil Nadu police in August 1988. He was produced before a magistrate in November, more than two months after the arrest and far in excess of the 24 hours stipulated by law. He was finally released in December. In this particular instance, the Karnataka high court, ruling on a *habeas corpus* petition filed on his behalf, dismissed it on the technical ground of failure to name the police officers involved. Of course, it goes without saying that torture in its crudest forms was practised on all the victims.

If precedents are anything to go by, a contemptuous dismissal of the AI report by the hidebound powers-that-be will not be unsurprising. It will be recalled that minister P Chidambaram, reacting to an earlier report by AI, had labelled it 'motivated' and asserted that the government was not answerable to anybody except parliament. Consider the stacked parliament, in which the majority nods its supine assent to all government moves, and the implications become clear enough. There is not even a pretence of being democratic, as the state rides roughshod over even ordinary political freedoms. All this, we are informed, is not only legitimate but also imperative in the larger interests of the country.

Threat to national integrity has over time become a protean concept that accommodates a whole range of phenomena, including the ubiquitous, if spectral, foreign hand, political dissent against the state or even the party in power and, incredibly enough, on occasions factory strikes for wage increases. Allusions to the foreign hand have been increasing in frequency, in an attempt to build up a kind of party-based national chauvinism. The official branding of AI as an adjunct of the foreign hand—in this case the American hand—obviously fits into the pattern. The idea is to create an identity between the Congress and the nation. It follows that any criticism of the former can be represented as a threat to the latter and permits the legitimisation of state perpetrated crimes. It is indeed tragic that in the 'world's largest democracy' the right to life and the right to constitutional redress are, in particular instances, no longer justiciable. What is worse still is that apocryphal threats to the nation's sovereignty should legitimise this tragedy.

COTTON

Avoiding a 'Crisis of Plenty'

ENCOURAGED by the further hefty hike in the support prices for 'kapas' for 1989-90, taking the rise during two consecutive seasons to Rs 90-Rs 100 per quintal which is larger than the total increase over the past decade or so, and emboldened by the meteorological department's forecast of a normal monsoon and its timely onset, farmers are reported to have brought more area under cotton in quite a few states where sowings have been completed or are nearing completion. Estimates of the increase in acreage range between 4 per cent and 10 per cent. The quality of crop information being what it is, none can really vouch for the accuracy of the estimates regarding the area sown under cotton. Perhaps all one could say is that the acreage under cotton may well be somewhat larger than in 1988-89. But that may not be saying much really. For cotton production in any particular season has all along depended less on the area sown than on the yield which in turn has depended essentially on the pattern of rainfall during the season and the damage caused by pests, especially white fly.

For the present, new crop prospects can be reckoned as very reassuring. Weather conditions in all the major cotton growing areas so far have been good to ideal. If climatic conditions remain favourable during the rest of the season and there is also no damage by pests, one could hopefully look forward to a record cotton crop in 1989-90. While it is altogether premature to make any meaningful forecast about the crop at this stage, the government will do well to carry out some exercises with varying assumptions to evolve various policy options for efficient management of the emerging situation.

It would be unfortunate if the anticipated increase in production were to be allowed to precipitate a 'crisis of plenty' pushing down prices to levels which have an adverse effect on farmers' intentions to cultivate cotton. One can plausibly argue that such a situation is unlikely to arise since the Cotton Corporation of India is there to undertake necessary price support operations and that growers have little to complain about the revised support prices. But instances abound when cotton growers have had to sell their produce well below the support prices in a situation of 'over-abundant' supply due to serious deficiencies in the marketing infrastructure.

Talking to a cross-section of knowledgeable persons in the cotton trade and textile industry the impression one gathers is that the 1989-90 crop will have to be really a bumper one—over 115 lakh bales—to cause any major landslide in prices thereby imposing a serious strain on CCI's organisational capabilities to carry out price support operations on the requisite scale. It had handled 12.52 lakh bales under the price support operations in 1985-86.

The view is widely shared that cotton prices are unlikely to decline to support levels if the crop is under 115 lakh bales. Cotton prices have been displaying a firm tendency for the past few weeks, reflecting mainly shortage of quality cotton at the fag-end of the season which has just one more month to go. The ruling prices of cotton, while lower than a year ago, are substantially above the revised support prices for 1989-90, with medium and long varieties quoted 35-45 per cent higher and extra long staple cotton about 85-90 per cent higher.

Mill consumption of cotton is running at a record high level and it is on the increase as the cotton textile industry, especially the spinning sector, is having a pretty good time. Both yarn and cloth are fetching high prices on good domestic and overseas demand. In view of improved agricultural prospect in the wake of another good monsoon, domestic offtake of yarn/cloth can be expected to be maintained at a high level. As for export demand, the international environment continues to be favourable.

The more recent reduction in the minimum export price (MEP) for extra long staple cotton from \$ 4 to \$ 2.8 a kg is a belated recognition by the textiles ministry of its earlier blunder which has resulted in substantial loss of valuable foreign exchange. Unquestionably, the failure to fully utilise the export quota of one lakh bales each of Bengal Deshi and extra long staple cotton despite extraordinarily favourable conditions in the international market is attributable entirely to undue delay in the announcement of MEPs which were fixed arbitrarily in complete disregard of the prices prevailing in the highly competitive overseas markets.

The revised MEP is certainly realistic and it has enabled negotiation of some fresh business. But since the announcement has come too late in the season when the overseas buyers have covered almost all their immediate requirements and are inclined to make fresh purchases only when new crop supplies become available, prospects of fresh large business are rated low. There seems little chance of utilising even half of the export quota of extra long staple cotton before the end of the season. All this underlines the imperative need to evolve a dynamic export policy as this may well have a crucial role to play in bringing about a better balance in the overall supply-demand equation as also in rectifying the varietal imbalance that has become quite pronounced over the years.

With cotton production having got more or less stabilised around the 100-lakh bales mark which can take adequate care of domestic needs, the government should seriously consider earmarking suitable areas for production of cotton only for export and organise the supply of quality seed as also other inputs. Production of quality cotton of international standards is of utmost importance for successful exports on an enduring basis.

New Delhi's reported decision allowing the Maharashtra government to go ahead with its cotton monopoly procurement scheme in its present form for another year suggests that the government wants to have a closer look at the various points made out by the Hate Committee in its report on the monopoly scheme before granting extension for a much longer period.

While the monopoly procurement scheme has always come in for considerable criticism on various counts, much of the criticism betrays lack of proper perception of the basic objective of the scheme—securing maximum prices for the cotton growers in the state. One does not expect the private trade to take kindly to a scheme which seeks to restrict the scope of its activity. Nor can the textile industry be expected to view with favour a scheme which is designed to secure for the farmer a better price for cotton which constitutes its major input.

There have been occasions when cotton has been smuggled out of Maharashtra and smuggled into the state in search of higher prices. But this is no reflection on the monopoly scheme nor has it anything to do with the quality of management. It is the unrealistic guaranteed prices which are to blame for this phenomenon. Nor should the scheme be judged, as many are wont to do, by the losses or profits it has made. For that depends on the difference between the guaranteed prices fixed by the government—central or state—and the ruling prices of cotton at which the sales are effected. The Federation operating the scheme has little control over the ruling prices which are governed by the overall

supply and demand equation for cotton.

Despite its various shortcomings, the monopoly scheme should be deemed to have served a useful purpose if it has enabled the cotton grower to realise a better price for his produce than he would have done entirely on his own with all the financial constraints and deficiencies in the marketing infrastructure under which he operates. A scheme which seeks to eliminate intermediaries and offer the facility to hold cotton on behalf of the grower over a longer period of time in the hope of realising better prices has much to commend it. That the implementation of the monopoly procurement scheme leaves much to be desired is another matter. Even the CCI had to be salvaged from financial ruin by converting its huge accumulated losses into a government loan. Needless to add, only the state government can operate the monopoly procurement scheme because its implications extend well beyond purely commercial operations.

DIAMOND EXPORTS

Net Foreign Exchange Loss

M D Dewani writes:

INDIA's diamond export business has gone topsy-turvy and has led to a net loss of foreign exchange earning in the first quarter of 1989-90 instead of any value addition whatsoever. The authorities concerned seem to be unconcerned about this alarming situation, as is evident from the fact that no concrete remedial measures have yet been taken by them to stem this rot.

Though the trade announced a few days ago that diamond exports during the April-June 1989 quarter had touched a new high of Rs 1,091 crore, compared to Rs 811 crore during the same period last year, the announcement concealed the other side of the picture. According to the provisional export-import statistics available now, India's diamond exports, no doubt, amounted to Rs 1,100 crore in the first quarter of 1989-90, but they were actually less than imports amounting to Rs 1,142 crore, with the result that the country has suffered a net foreign exchange loss of Rs 42 crore in the period, even without taking into account the foreign exchange expenditure incurred by the trade on foreign travel, etc. It might be interesting to note that in the corresponding period of the previous year there was a net foreign exchange earning of about Rs 92 crore.

Informed sources do not rule out the possibility of the excess imports finding their way into the domestic market or being surreptitiously dispatched abroad in view of the difference between the official and unofficial rates of exchange. Diversion of diamonds to the internal market now continues unrestrained following the removal of the condition which was intended to prevent it. Import replenishment in the case of bigger stones, where value addition is very poor, is excessive. The sharp drop in net realisation also indicates the possibility of serious manipulations. The system of issuing import licences prior to foreign exchange realisation is also believed to have led to serious abuses.

Statistics also show that diamond exports from the country slumped to Rs 340 crore in June 1989 from Rs 405 crore in the previous month. Among several reasons for the debacle the most important one is the blow dealt by De Beers to the Indian industry by imposing a stiff and discriminatory hike in prices of rough diamonds towards the end of March. While the average price increase announced by it was 15.5 per cent, that in the case of certain varieties purchased particularly by the Indian industry ranged as high as 20 to 40 per cent. Foreign buyers are naturally reluctant to buy the polished goods at higher prices and export business has been adversely affected. It is understandable that the direct clients of De Beers' subsidiaries should be reluctant to complain about such discrimination, but it remains a mystery why the authorities concerned should subscribe to the theory that 'the cartel can do no wrong' and should take such practices lying down.

De Beers is also guilty of helping in the diversion of considerable amount of foreign exchange to some other countries by giving to them some additional supply of certain varieties required by the Indian industry and by indirectly forcing the Indian industry to purchase these from them by paying to them their margins, etc. According to some estimates excess foreign exchange to the tune of Rs 100-150 crore was thus diverted last year from India to other countries. It is not known why the authorities are indifferent to this game which hurts the exchequer and pushes up the cost to the Indian industry.

All this apart, the recent fluctuations in the value of the dollar in relation to some other currencies, some bankruptcies in the US and the unsettled business conditions in Hong Kong have also contributed to the setback in exports. However, the situation for the Indian industry would not have been as bad as one finds it to be at present, had the authorities prevailed upon De Beers to desist from such blatant discrimination against the Indian industry.

TWENTY YEARS AGO

EPW, August 2, 1969

There can be little doubt about the significance of the political developments of last month, beginning with the prime minister's note on economic policy to the Bangalore session of the AICC and climaxing with Morarji Desai's exit from the government and the nationalisation of the major banks. But some of the conclusions that are being drawn about what they portend for the future course of national politics as well as politics within the Congress Party need to be examined. It is being suggested that economic policy, or ideology, has been at last introduced as a major element into the conflict between Indira Gandhi and her opponents in Congress and that the long-awaited polarisation in the party has begun which must, inevitably, extend to the larger sphere of national politics. Proof of this is sought in the fact that in the last few weeks the prime minister has visibly drawn on the support of leftist elements outside Congress. The right CPI has always set great store by such a consummation, but even parties like CPI(M) and SSP which earlier had little use for the so-called Congress left appear to have accepted the political wisdom of backing Indira Gandhi. Both the left and the right have bought the polarisation thesis. While the left has assumed that the prime minister will—in fact, that she has no choice but to—steadily unfold a programme of radical action, the right has proclaimed that her continuance in power will push the country towards socialism, communism, vassalage to the Soviet Union and much worse. . . The fact that the power that the Syndicate wields at the centre is not justified by the influence or loyalty that its members individually command at lower levels of the party organisation immediately opens up for Indira Gandhi the possibility of approaching the state organisation above the heads of these leaders. If this is the political strategy that she is going to pursue—being prime minister and in addition being now in direct control of the central purse-strings places her in a strong position to do so—certain implications follow. First, she is unlikely to make any move that will further antagonise the party organisation such as, for instance, clipping the wings of a relatively prominent organisation man like Chavan. A cabinet reshuffle may follow in due course, but this is likely to have as its objective the substitution of some political light-weights with more solid cargo. Second, with the possible exception of abolition of privy purses (if one can call that a radical step) the expected leftist bill of fare may not materialise. The courtship with leftists outside Congress, it follows, will also be cut short abruptly and rather soon.

BATA INDIA

Deterioration of Margins

BATA INDIA has suffered a sharp setback in its working results for 1988 due to the lock-out in Batanagar factory and picketing of company's shops in eastern India. Although net sales turned out to be a shade higher at Rs 255 crore against Rs 254 crore, in the previous year, gross profit slumped to Rs 4.81 crore from Rs 8.82 crore, showing severe deterioration of margins. Net profit dropped from Rs 3.87 crore to Rs 1.41 crore. Dividend has been reduced from 15 per cent to 10 per cent which is covered 1.88 times by earnings as against 3.47 times previously.

There were a series of industrial relations upheavals at the Batanagar factory with frequent stoppages, disruption of work, go slow tactics, etc, culminating in a lock-out at the unit. The factory remained closed for a period of four months during July-November 1988 before a satisfactory settlement was achieved. A long-term settlement has been achieved with the Union which provides, *inter alia*, for acceptance of technological changes in the manufacturing processes. With this settlement, the overall industrial relations climate is expected to improve, making the Batanagar unit more manageable and viable and thereby contributing to the overall prosperity of the company. The directors feel that decline in profit in 1988 may be considered a small price to pay for achieving a satisfactory settlement which will have long-term advantages for the company's growth and prosperity. Commercial production at the new factory in Peenya Industrial Area near Bangalore commenced during the year.

An agreement has been arrived at with Adidas of West Germany for manufacture and marketing of sports and special application footwear, sports goods and sportswear in India and the management is hopeful of launching the Adidas product line during the winter of 1989. The company launched the marketing of North Star clothings designed by Murjani International of New York, USA and sourced through Inmark Brands. These have been well received by the public and sales have been satisfactory. As a complementary product, the company has started to market Ambassador shirts through its selected retail outlets.

Capital expenditure during the year amounted to Rs 3.7 crore as against Rs 3.26 crore in the previous year. The expenditure was mainly on the modernisation of the company's retail outlets and on the installation and commissioning of a modern effluent treatment plant at the Mokamehghat tannery. The company's exports during the year were Rs 10.26 crore. Of this, own manufactured products accounted for Rs 7.53 crore and the balance represents exports of third party merchandise. The company had to restrict the export orders because of the Batanagar lock-out. A new R and D unit has been set up at Bangalore to assist the newly established Bata plant and the company's associates in the small-scale sector in the Southern region.

SPECIAL STEELS

Good Results

SPECIAL STEELS has fared so well during the 15-month period ended March 31 last that the board of directors has recommended issue of bonus shares on a one-for-two basis besides payment of a dividend of 25 per cent against 15 per cent paid last year. On a turnover of Rs 203 crore against Rs 118 crore in the previous 12 months, the company has earned a gross profit of Rs 24.22 crore against Rs 12.69 crore. These figures show an increase in profit margins. After higher necessary provisions, net profit is substantially better at Rs 14.96 crore compared to Rs 7.95 crore of 1987.

All the plants of the company continued to operate at more than 100 per cent of the rated capacity. Production records were achieved at Borivli and bead wire plants. Production of the mini-steel plant, however, was lower than the previous year on account of power shortage, resulting from breakdown in MSEB's distribution system to Tarapur, which curtailed power supply for a period of 4 months as well as due to shortfall in availability of scrap. There was also disruption in operations of the plant in March 1989 on account of implementation of the modernisation programme. Shortage in output of billets resulted in shortfall at the wire rod mill. Wire rod mill's production was also affected by industrial relations problems. The increase in turnover could be achieved on account of higher output, improvement in the product-mix and better sales realisation. The increase in profits has been achieved after absorbing sharp increases in the cost of indigenous as well as imported scrap, imported wire rods, salaries and wages of employees resulting from the new wage settlements and dearness allowance.

The company completed the first phase of the scheme of modernisation of the mini-steel plant including introduction of water cooled panels and modern pollution

control equipment. Work relating to installation of ladle furnace and high power transformer is expected to be completed in August, 1989. The modernisation programme will result not only in higher output but also in cost reduction and improvement in steel quality. Two new wire drawing machines were set up at the bead wire plant as part of the phased replacement of old machines. At Borivli, a new furnace for processing stainless steel wires was set up and a raw material godown, to improve handling of materials and increase storage facilities, was constructed. The government has converted the letter of intent granted to the company to enhance capacity of wire rod mill from 60,000 tonnes per annum to 96,000 tonnes per annum of wire rods into an industrial licence. Government has also endorsed higher capacity of 72,000 tonnes per annum of billets, resulting from modernisation of the mini-steel plant, on the industrial licence. After detailed study of various proposals, it has been decided to set up, subject to necessary government approvals, a cold rolling mill with a capacity to manufacture 1,00,000 tonnes of cold rolled steel strips and sheets mainly to cater to the requirements of automobile, refrigeration and air-conditioning industries, which are at present imported. The company has recently submitted applications for an industrial licence and clearance under the provisions of the MRTP Act.

MANGALAM CEMENT

Higher Dividend

MANGALAM CEMENT has shown improved performance for the 15-month period ended March 1989. Production of cement increased from 3,31,163 tonnes in 1987 to 4,86,260 tonnes in 1988-89. The average capacity utilisation during the 15-month period was 97.24 per cent. Turnover amounted to Rs 38.10 crore against Rs 23.20 crore previously and gross profit stood at Rs 6.78 crore against Rs 3.89 crore, reflecting enhanced profit margins. Despite higher necessary provisions, net profit increased to Rs 3.15 crore from Rs 1.70 crore. The directors have stepped up dividend from 15 per cent to 22.5 per cent which is covered 1.95 times by earnings as against 1.59 times previously.

The directors point out that availability of coal of required quantity and desired quality continues to be a severe restraint. The kiln had to remain closed for 8 days during 1988-89. After persistent efforts by the industry, the government granted an increase of Rs 47 per tonne in the retention price of levy cement effective from September 7, 1988. This, however, was inadequate to offset the increase in the cost of production.

A Plea for Open Government

Case of Narmada Project

Arun Ghosh

If the present leadership of the country really believes in democracy, in giving power to the people through panchayati raj, if the Planning Commission is sincere about planning for the country's development and not in promoting the sectional interests of a few technicians and contractors, they ought to come out with a white paper on the Narmada Valley Project, give it wide publicity and have it debated openly.

OF late, the science of governance appears to be increasingly oriented to secrecy in regard to the functioning of government, and efficient public relations (or PR for short) seems to have been perfected to an art, to replace open debate and to elicit support for government policies. Thus we find that the government budget today reveals less and less, even as government expenditure gobbles up an increasing share of the national product. The sources of routine, rudimentary data are denied to common citizens, not overtly but through non-availability and inaccessibility. Most official data are "for official use only"; and at times even elementary facts are held back under the Official Secrets Act.

What is extraordinary about this situation is that the shroud of secrecy extends over even matters concerning vital planning decisions—on projects and programmes that are estimated to cost billions of rupees, and affect the lives and well-being of millions of Indian citizens. The gigantic Narmada Valley Project, encompassing the Sardar Sarovar Project (SSP) and the Narmada Sagar Project (NSP), falls into this category; the entire project has apparently been cleared by the Planning Commission—though this minor details is never publicised—without the Indian citizenry being informed of either the costs or benefits of this mega project.

There are, of course, many respectable experts who have lent support to this mega project. B D Dhawan, one of the most respected experts on irrigation in India, has extended *conditional support* to the project (vide *Economic Times*, December 5, 1988, and *EPW*, May 20) suggesting that perhaps scaling down the height of the dam (at the SSP) by a mere 35 feet could reduce the area of the submerged land to one-fifth, thereby significantly reducing the number of oustees. He has also suggested that the Planning Commission should make public its cost-benefit calculations.

But then, the government seems to have become increasingly insensitive to public criticism. It is, of course, entirely possible that the project is being pushed through by a group of technologists, bureaucrats and politicians who have a vested interest in getting large projects sanctioned; after all, a large contract always offers the possibility of a sizeable 'cut' from the contractor. But then, *that* would apply to a small coterie, and it is by no means clear why the government as a whole (including the planners and their advisers) have been so tight-lipped on this entire project. Can *anyone* claim with justification that the estimates pertaining to this project should be kept back from the public under the Official Secrets Act? Or that the doubts of the department of environment—never officially made known, and yet filtering through somehow—should be suppressed?

Somehow, the approach and attitude of officialdom on this issue pass comprehension. Indeed, the very credibility of the government becomes open to question, especially when one considers that as far back as September last year, over 500 distinguished citizens from all walks of life had submitted a memorandum to the prime minister, voicing their concern and opposition to this project. If these distinguished and highly respected—each in his or her walk of life—citizens have been wrong, is it not the duty of the government to publicise the correct facts?

This approach is all the more incomprehensible when one considers all the recent pronouncements of the prime minister, in regard to panchayati raj, in regard to giving power to the people at the grassroots level to determine their own future. How are the approximately 2.5 lakh oustees to be rehabilitated? Are they being given an earthly chance to determine where they should live, and how? Even assuming that the cost: benefit ratio of the project is highly favourable, can the authorities indicate how precisely the oustees are to be resettled, whether the plans of their resettlement are realistic, whether those already ousted have been rehabilitated? For, the only information available to the public, in the context of the veil of secrecy surrounding this project, is that the people already displaced from the dam site have so far been totally forgotten; apparently, they being not among those whose lands would be 'submerged' do not even qualify for settlement by the Narmada Valley Project authorities.

As stated earlier, there are no official data to go by; one has to piece together the costs from diverse sources. Baba Amte has recently cited some figures (vide *Indian Express*, July 9) which appear to have the stamp of authority and accuracy, having been taken from a report prepared by C C Patel and Associates Ltd (CCPAL). (Incidentally, the name sounds familiar; one C C Patel was once the chairman of the Central Water Commission and later irrigation secretary to the government of India. One does not know whether it is the same C C Patel who has floated CCPAL as a consultancy organisation and, if so, whether there is some nexus between this fact and the speed with which approvals are being accorded by the union government to the project. I would like to add that there is no imputation of any ulterior motive herein; it is just that the orientation, the thinking, the vision of an irrigation engineer is generally in favour of large projects involving the storage of surface water which would otherwise flow down to the sea; such an expert is not able to encompass the *indirect costs* of storage of such water.)

But let us examine some of the estimates of CCPAL quoted by Baba Amte. (And I repeat, these are figures as given by Baba Amte in the *Indian Express* cited earlier; they are cited here only because the government does not see the need to release any figures on the project for public consumption.) The SSP is likely to cost Rs 11,154 crore—one does not know at which reference year prices; the CCPAL report is dated July 1988, so one presumes that the estimates would be at 1987-88 prices. This does not include the cost of the NSP, nor of the many smaller schemes necessary for making full use of the reservoir potential. For financing the SSP, the government of Gujarat would have to provide Rs 8,500 crore between 1989-90 and 1997-98, i e, in nine years—apparently, the governments of Madhya Pradesh, Maharashtra and Rajasthan are to fork out the rest—and of this colossal sum, international aid (by the World Bank and Japan) would provide only some Rs 960 crore.

Baba Amte has given details of the extent of irrigation the project is likely to provide to the drought-stricken areas of Gujarat. Apparently, in Saurashtra, more than 80 per cent of the talukas are not likely to get any water from the SSP; in Kutch 5 out of 9 talukas will not get any water; about two-thirds of the 62 talukas getting water from the SSP are neither drought-prone nor arid; and two-thirds of the 52 drought-prone or arid talukas of Gujarat would get little or no water from the project. The estimate of the union department of environment in regard to the "environmental cost of loss of forests" is placed at Rs 30,293 crore for the NSP and Rs 8,190 crore for the SSP.

This piece is *not* intended to be a broadside at the Narmada Valley Project; I do not have with me any facts other than those given out by Baba Amte, and he has argued succinctly against proceeding any further with the project. Even now, the height of the dam can be scaled down—as suggested by Dhawan—so that some 80 per cent of the area proposed to be submerged can be saved from submergence. As a result, the NSP can also be scaled down. That would doubtless affect the economics of the project, but it would save a considerable part of the forest area which would otherwise be submerged. Thus, part of the indirect costs—perhaps not even reckoned in the present cost: benefit analysis—can be avoided. In brief, the entire project needs a fresh look.

But, to reiterate a point made earlier, the present discussion is essentially a plea for more open government. Certainly, there is absolutely no case for such secrecy as exists in regard to major schemes and projects approved by the Planning Commission. That body has doubtless some very competent technologists and advisers; however, these gentlemen do not have a monopoly of wisdom. Being officials, they may be expected to conform; even where they may not agree, they are tongue-tied. But investments of the order involved in the Narmada valley—of the order of Rs 20,000 crore in all, if note is taken of all associated schemes—the gestation period involved, the indirect costs in terms of environmental damage and rehabilitation of the displaced persons, all these factors call for a public debate on the *pros* and *cons* of such a project before it is undertaken. It is inconceivable that such an enormous project is taken up without taking the entire nation into confidence, without debating on the complex issues, without comparing the totality of costs with the anticipated benefits. If the present leadership of the country really believes in democracy, in giving power to the people through panchayati raj, if the Planning Commission members are sincere about planning for the country's development and not in promoting sectional interests of a few technicians and contractors, they ougnt to come out with a white paper on the Narmada Valley Project, give it wide publicity, and have it debated openly. The members of parliament also need to demand more information on this mega project, for we are committing large resources over a long period of time for this project. Quite apart from anything else, there is obviously little wisdom in making a new start on such a mega project when we have no dearth of important projects which are incomplete and are getting delayed because of the paucity of financial resources with the government. This is a theme which has been emphasised repeatedly in this column earlier; what we need today is to quickly complete projects which are half complete so that their benefits start flowing to the economy quickly. At a time when the cost of such incomplete projects is some Rs 80,000 crore or more, there is little merit in starting yet another one costing Rs 20,000 crore, especially when the benefits of such a project can arise only sometime in the next century.

But most importantly, this is, to repeat, a plea for more open government. If the present leadership is sincere about giving power to the people—a shibboleth which is being repeated day in and day out—then the leadership should treat the citizens of this country as responsible adults. And as responsible adults, we have a right to know the full facts on the Narmada Valley Project.

Rajiv-Farooq Accord: What Went Wrong?

Balraj Puri

The Rajiv Gandhi-Farooq Abdullah accord implicitly undermined the status of Jammu and Kashmir and questioned the loyalty of the people of the state. The accord has also had other adverse consequences for the state's politics. What is needed, therefore, is some rethinking on the philosophy of the accord, on the strategies of the coalition government headed by Farooq Abdullah and on the Kashmir policy of New Delhi.

THE current situation in Kashmir, which is a culmination of a definite political trend since Farooq Abdullah resumed power in the state in November 1986 following what was called Rajiv-Farooq accord, does not leave any room for doubt that the avowed objective of the accord of fighting anti-national and communal forces has not been achieved. In fact the situation is a logical consequence of the accord.

In a way, 'accord' was hardly the appropriate term to describe what was essentially an agreement between two political parties to form a coalition government and an electoral alliance to contest elections. Such agreements among other parties or elsewhere in the country have normally not been given the exalted nomenclature of accord. Since the Congress-National Conference arrangement was described as an accord, it was perceived to be in the category of the Indira-Abdullah accord, the Rajiv-Longowal accord, the Assam accord and the Mizoram accord. The common feature of these accords was an agreement between the regional leaders and the prime minister of India over disputes regarding the status or problems of the respective regions.

There was no such dispute in Jammu and Kashmir state which Rajiv Gandhi and Farooq Abdullah resolved. It was an agreement between them as presidents of two political parties. But the way it was perceived, interpreted and projected, it implied a new agreement over centre-state relations. Farooq Abdullah himself justified it on the ground that the policy of confrontation that he had pursued with the centre for two years earlier had cost the state dearly.

Farooq Abdullah's position clearly implied, firstly, that it was an agreement between him and the centre and not with the Congress Party and, secondly, that a state like Jammu and Kashmir would not get its due share in the federal set up of India if the ruling party at the centre did not share power in the state. Further, to accept a political arrangement for the sake of getting more money is to cause humiliation to any self-respecting people. But nobody questioned these obvious implications. Indeed a columnist like J D Sethi, no friend of the ruling party, explicitly raised the arrangement to the level of a national policy when he argued that in the border states the party in power at the centre must share power with the regional parties (*The Hindustan Times*, May 4).

This reduces the status of such states to less than that of the states of the mainland. For while the latter have a right to elect a party of their choice to rule them, the people of a border state are required to be governed, albeit partly, by a party (in power at the centre) which might not have a substantial existence in the state and, for one reason or the other, is not liked by its people. In other words, the people of the border states are expected to prove their loyalty to the country by the additional test of demonstrating their loyalty to the party in power at the centre.

Is there a better way of making border people disloyal to the country? In fact there is a special reason for showing greater respect for the susceptibilities and the autonomy of frontier regions, as was done in India during British rule and is being done in other large countries because these regions can perceive of a secessionist option which is not available to the mainland people.

The Congress-National Conference alliance had some other inherent adverse consequences. It damaged the *raison d'etre* of both the parties. For the National Conference owed its popularity in Kashmir mainly to its role of defending the Kashmiri identity against the supposed threats from the central government controlled by the Congress. It symbolised, in particular, the anger of the people of Kashmir against the dismissal of the duly elected government of Farooq Abdullah in 1984. But when the same Farooq Abdullah, two years later, joined hands with the party responsible for his dismissal, his National Conference ceased to be an instrument of protest and was instead perceived by the people of Kashmir to be as an instrument of humiliation.

Likewise, Congress support in Jammu was based on its supposed ability and assurances to defend the identity of the region against what its people called Kashmiri domination. But its alliance with the National Conference ensured just the opposite. It conceded the supremacy of the Kashmiri leadership of the National Conference in ruling over the state including Jammu.

The alliance, above all, blocked secular and nationalist outlets for popular discontent. As long as the two parties were opposing each other, those dissatisfied with the state government expressed their dissatisfaction through the Congress while those against the policies of the centre ventilated their feelings through the National Conference. This neat division of state politics between two nationalist parties marginalised extremists in all the regions of the state.

Past experience amply bears out the fact that whenever the state had a two-party system it strengthened secular democratic forces, whereas whenever secular forces formed a single front extremist forces got an opportunity to fill the vacuum. Notwithstanding such empirical evidence and the logic of common sense, nationalist opinion has favoured and worked for the "unity of secular forces" and has failed to appreciate the integrating and creative role of the division of the secular forces into two parties, with one functioning as an opposition party for channelling discontent.

Democracy can be used to promote national unity by enlarging popular satisfaction as also by providing healthy outlets to those who are not satisfied. On both counts, the National Conference-Congress(I) alliance in the state suffered from some inherent and some self-created limitations.

In order to increase the sum total of satisfaction of the people an elementary knowledge of their aspirations is necessary. Of this the alliance leaders did not betray any indication in the stated objectives of the accord, in their election manifesto or in any other statement. There is no reference in them to the aspirations of different cultural, ethnic, regional, religious or class identities or to the human urges for freedom and dignity.

Sheikh Abdullah used his knowledge of

Islam to expose the 'un-Islamic' character of the leadership of the Muslim League and later of Pakistan. Hazaratbal remained an emotional, religious, cultural and political centre of Kashmir for half a century. But the sudden and mechanical separation of religion and politics that was now attempted left the entire religious field vacant for the fundamentalists to exploit. Farooq could not and need not have attempted to duplicate the role of his father. But as president of Auqaf, which also manages Hazaratbal and other shrines, it was his responsibility to enlist the services of competent ulema of Islam to prevent misuse and exploitation of the glorious and catholic tradition of their religion in Kashmir by the opponents of secularism and national interest.

Suddenly Kashmiriat and the regional identities of Jammu and Ladakh also became taboo terms in the political vocabulary of the state, overlooking the fact that it was the sentiment of Kashmiriat on which Abdullah had mobilised his people against the armed raiders from Pakistan in 1947 and that it is regional identity that is the most potent cementing force among the various communities in Jammu and Ladakh and thus making for decommunalising of their politics. In any case, the legitimacy of regional pride is by now hardly questioned in any other part of the country.

Farooq Abdullah did announce, soon after resuming the chief ministership, the appointment of a commission headed by the present writer to work out the details of regional autonomy. Formal consent of some of the best experts of the country was also obtained to serve on the commission. No reason was ever given for wriggling out of the announcement.

Again, Ladakh has remained unrepresented in the state cabinet though the cabinet has been expanded to a record strength of 30. It has also been denied the status of a scheduled area promised to it since 1980. The claim of the Gujars for a similar status, though encouraged, too, has not been conceded. Again, the emerging Pahari identity is clamouring in vain for recognition. The legitimate cultural and linguistic problems of the two principal languages, Kashmiri and Dogri, have also remained unattended to. The cumulative effect of not recognising secular identities based on region, ethnicity and language and not conceding even their moderate demands has been to encourage alignments on communal lines.

The National Conference-Congress(I) alliance had hardly any class appeal either. For no call was given for redistribution of income and wealth or to restructure the economic system to make it more egalitarian and to meet the minimum needs of the people.

The alliance had nothing to offer to the citizens even at the individual level in the form of a less corrupt and more efficient administration, enlargement of civil liberties and greater sense of participation.

The exclusive focus of the propaganda blitz over the accord was on development. To treat development as a substitute for all human urges—ethnic, religious, regional, and class—is to insult the human mind and equate human beings with robots. Most of the human urges of the people are in their capacity as members of various identity groups. Only rootless people are without an identity. Development is not only no substitute for human urges, it is known to whet them everywhere and to sharpen the urge for an identity.

Moreover, the yawning gap between the actual performance in the development field and the sky-high expectations aroused by the accord was bound to cause deep frustrations. Even Farooq Abdullah himself is occasionally constrained to complain publicly against the centre for not fulfilling the expectations of the people in terms of development allocations. He has also raised the issue of the extremely low share of Kashmiri Mulsims in central government departments in the state. Where will the two lakh unemployed Kashmiri youth go, he asked at a function of the Kashmir Chamber of Commerce. The real integration of the state with the rest of India, he said, would be possible only if the centre adopted a more positive attitude towards the development of the state. If the chief minister is not satisfied over the role of the centre in regard to the development of the state, which was the *raison d'etre* of the accord, the level of dissatisfaction of the common man on this score can be imagined.

To be sure, all the troubles in the state are not the direct outcome of the accord. Nor is the accord responsible for all the shortcomings in the performance of the coalition government. But if the partners in the alliance had realised the inherent limitations of the accord and taken compensatory measures to overcome them, they would have faced the situation better.

Moreover, every system, especially a democratic one, must provide for avenues of expression of discontent. While the accord removed from the political scene the major such avenue in the form of an opposition party , no other avenue was provided within the system.

Nor could the growing frustration due to the many causes mentioned above find adequate expression through the elections as they were widely perceived to be less than fair. The failure of the opposition parties to fill the vacuum is no less conspicuous and inexcusable. These factors all the more necessitate the provision of a credible grievance redressal machinery and an institution like an ombudsman.

The foregoing explanation of the form discontent has taken in Kashmir is not to justify it. But it is a plea, on the basis of the actual experience of Kashmir politics for the last forty years and the elementary laws of political behaviour for some rethinking on the philosophy of the accord, the strategies of the coalition government and the Kashmir policy of New Delhi as also of all political parties and the nationalist opinion of the country, so that ideological, political, cultural and administrative weapons are not completely discarded in favour of the weapons and methods of the police.

Financial Liberalisation

Unconvincing Case

If the growth of South Korea's financial system in an environment of reform and liberalisation is considered worthy of mention, the growth of India's financial sector has not been less striking. Yet the World Bank's World Development Report *completely ignores it. And this is precisely what renders the case for financial liberalisation that the report seeks to make less than convincing: it ignores all evidence which goes against the dogma it sets out to propound.*

THE World Bank's *World Development Report, 1989* focuses on the role of financial systems not only in developing countries but also in the advanced industrial countries and seeks to make uniform prescriptions for both. This is indeed an ambitious task, encompassing the whole spectrum of experience of countries at different stages of development. Perhaps only the World Bank could have made bold to undertake it; others may have been daunted by the fundamental differences between the processes of 'development' in the LDCs with unlimited supplies of labour and scarce capital and the processes of 'growth' in the advanced industrial countries with scarce labour and massive capital. For the World Bank, however, the central, if not the sole, issue is to goad the LDCs towards greater market-orientation and closer integration with the world capitalist economy. With that kind of a framework, the *World Development Report* has attempted its task with easy confidence. It is a different matter that its contribution to understanding the complex processes of development and the role of finance in them has been minimal.

For the framework of the *World Development Report* we have World Bank president Barber Conable's Foreword to the report. With the decline in net foreign capital inflows, the developing countries will have to rely more on domestic resources to finance investment. The right type of financial systems can help to mobilise savings and allocate "them to the most profitable activities", thus enabling the society "to make more productive use of its scarce resources". Thus the flow of resources into profitable activities is regarded as synonymous with the productive use of resources. However, to play this role effectively, the financial systems of most developing countries are diagnosed as being in need of restructuring, for the industrial and financial policies of the 1970s and 1980s "have left many developing countries' financial institutions insolvent".

The root of the problem is identified as government intervention to promote economic growth. "The interventionist approach was much less successful in promoting financial development." It follows that a solution to the problem lies in more market-oriented financial systems. Allocation of credit is best accomplished by reducing the number of directed credit programmes, the proportion of total credit affected by such programmes and the degree of interest rate subsidisation. The emphasis has to be on credit availability instead of on interest rate subsidies.

The report's attempt to build a case for "more liberal and open financial systems" has to be understood in the context of the changed thinking on the strategies of development in developing countries themselves. By the middle of the 1970s, there had occurred some disenchantment with the nature and pace of development in many developing countries. Bureaucratic processes had prevented the benefits of development from reaching very large segments of society. This provided the basis for the western countries, through the instrumentalities of the World Bank and the IMF and their own bilateral 'aid' programmes, to pressurise the developing countries to change course.

It is against this background that the *World Development Report* asserts that "the experiences of the 1980s have led many developing countries to reconsider their approach to development... To obtain all the benefits of greater reliance on voluntary, market-based decision-making, they need efficient financial systems". It is another story that the LDCs did not seek the other option—that of reorienting their development strategies in such a way that the balance of economic power and the benefits of development shifted in favour of the poor and the underemployed and unemployed.

Coming back to the role of finance in development, the *World Development Report* reveals an altogether narrow perspective: "the financial system's contribution lies precisely in its ability to increase efficiency". This raises a whole set of questions about the definition of efficiency. When some two-thirds or more of the people in many developing countries do not get a decent living, if financial institutions are oriented towards extending, directly or indirectly, finance to enable a section of such people to improve their productive capabilities, can this policy be objected to on the ground that it offends the criterion of "efficient" allocation of resources?

That apart, the report does not show an understanding of the rationale of the interventionist approach to financial development adopted in the LDCs. In an environment of acute market inefficiencies, public intervention has been found to be a necessary instrument for minimising distortions. Control on interest rates on bank deposits, for instance, has been universally accepted as necessary for regulating the flow of rentier incomes. While the report agrees that interest rates have an uncertain effect on the amounts people save, it argues that their effect on the form in which people save is clear. This is only partly true, for the report's premise that high interest rates favour financial over non-financial savings is not a proven one.

It is true that savers with financial assets shuffle such assets depending upon relative yield rates, but the propensity to hold non-financial assets (gold, real estate and goods) is hardly affected by high interest rates on financial assets. Apart from social considerations, pecuniary calculations too favour the holding of certain non-financial assets. Take the case of gold in India. In the past decade the price of gold has risen at an annual compound rate of 15 per cent. Real estate prices in some of the metropolitan areas have risen at an even faster rate. No banking system can offer real yield rates on deposits which compete with those on such assets and still hope to lend at realistic rates of interest. The lending rates have to bear some relationship with the rates of return on investment in different sectors of the economy. As it is, the keen demand for non-financial assets and their high and rapidly rising prices are the result of a distorted pattern of development which has occurred despite interventionist policies. Market-oriented policies would create more distortions and harm the development process further.

The rationale of an interventionist policy in the financial field should thus be clear. The determination of nominal interest rates cannot be left to the market which is invariably controlled by a small segment of society wielding economic power. These sections gain even from inflation. Secondly, these segments of socie-

ty derive far better returns from the use of capital than, say, marginal and small farmers. Therefore, lending rates have to differentiate between credit to these poor segments and other sections with stronger economic power. The pattern of development has also to take cognisance of the need for this differentiation. Considering the continued presence of acute poverty levels, the development strategies adopted by many developing countries during the 1950s to the 1970s have their continued relevance dring the 1980s and 1990s. What is in fact called for is a further strengthening of the redistributive bias of these strategies. Certainly, bureaucratic controls over development programmes have to be minimised and a greater degree of genuine democratic orientation needs to be introduced. However, the broad goals and strategies of development with an interventionist bias continue to be relevant even today.

While the World Bank's report requires closer study, a few specific comments are worth making at this stage. First, the report has paid scant attention to the success stories or to the successful phases of financial intermediation in many developing countries. Even when it makes some references to "the impact of directed credit programmes on credit and growth", it takes a grudging and negative view. It argues that while individual sectors have benefited from directed credit, the overall effect on growth has been hard to gauge. It is argued that "what matters is whether those who... received directed credit used their resources more productively than those who were denied credit would have". Consider this question in the context of India where there are different types of directed credit: somewhat rigidly regulated credit to wholesale trade, preferred credit to agriculture, small-scale industry, small business and even retail trade and credit to medium and large-scale industry related to its inventory and other requirements. The resource mobilisation effort of the Indian banking industry has been likewise commendable and deserved a closer study, but the *World Development Report* almost completely ignores it, presumably because this has been achieved under public ownership. While it need not be denied that the Indian financial system is replete with problems, it is a fact that public ownership has given stupendous strength and vitality to it. The financial infrastructure created in distant nooks and corners of the country is unparalleled in any part of the world. This has gone completely unnoticed in the report. If the growth of South Korea's financial sector in an environment of financial reform is considered worthy of mention, the growth of India's financial sector in a controlled environment has not been less striking.

Secondly, before rejecting the financial policies followed by the developing countries in the 1970s and 1980s an attempt should have been made to discuss their logic and rationale. There was a structured, planned approach to the development of the real economic sectors. Apart from social and infrastructural investments, basic and capital goods industries required massive funds and forward-looking entrepreneurship, both of which were lacking. The public sector filled the gap. The financial sector had to mobilise resources in driblets and deploy them to meet the developmental requirements. An unbiased critic would at least concede that the strategy adopted was certainly relevant and appropriate to that stage of development from the 1950s to the 1970s and it alone could have achieved the rapid growth achieved in several developing countries, including in India. Certainly, each of these countries in the current phase of their development is seeking some degree of re-orientation of its financial policies but that should not render the earlier phase irrelevant. Besides, the problems of the financial sector are indeed linked to the structural problems facing many of the developing economies and these problems are sure to get accentuated with financial liberalisation.

Thirdly, objections to cross-subsidisation of interest rates totally fail to take into account the structural features of developing economies. There is no sound theoretical basis for the so-called market-based interest rate structure when the markets are notoriously inefficient and differentiated. As explained earlier, an important consideration must be the paying capacity of the borrower. Therefore, a system of differential interest rates based on income-earning capacity and priorities of development derives its rationale from the structural features of the developing countries. The World Bank's report shows no awareness of this rationale.

Finally, all the four lessons of reform that the *World Development Report* has sought to draw seem unexceptionable: financial sector reform should be attempted after macro-economic stability has been achieved; where prices are distorted owing to protection or price controls, financial liberalisation may not improve the allocation of resources; and adequate, if less invasive, framework of laws and regulations will nevertheless continue to be necessary; and, finally, political and economic obstacles to the needed reforms have to be anticipated and transitional compensation to those most adversely affected has to be provided. A number of questions remain unanswered, however. For instance, in an environment of macro-economic stability will not a well administered financial system together with a wider dispersal of economic power expand the domestic market and provide a better impetus for growth and development? In any case, it can be said that there is no empirical support at all for the sweeping conclusion drawn by the report: "[a liberalised financial system] would continue to make mistakes and waste resources. But it would probably make fewer mistakes and waste fewer resources than the interventionist approach followed in many developing countries today."

State Terror in Jehanabad

The treatment meted out to Amarjeet Sohi after his arrest was reprehensible. According to reliable sources he was beaten up and tortured. The DIG (CID), who came to interrogate Sohi, personally tortured him.

IN the past year and a half, the state government, with the active intervention of the central government has launched a new offensive to crush 'extremist influences' in the central districts of Bihar. This offensive involves a twin-pronged strategy combining a strong police presence, with an accelerated thrust on general development goals, such as redistribution of land, improving transport infrastructure, providing houses, etc, to the weaker sections, and so on. These two arms are code named *Operation Rakshak* and *Operation Siddharth* respectively. While Operation Siddharth is confined to Gaya, Aurangabad and Jehanabad districts, Rakshak covers 7 districts. The seven central Bihar districts which have been identified are Patna, Nalanda, Bhojpur, Rohtas, Gaya, Aurangabad and Jehanabad. The union ministry of home affairs, under whose guidance the operation was planned, has identified 27 blocks in 7 districts as 'extremist affected'. The Bihar government however claims that 41 blocks in these seven districts are 'extremist affected', and in addition has identified 11 blocks in 7 more districts as 'extremist affected'. Reportedly the state government asked for 12 battalions of paramilitary forces to police this area. The central government however thought that four would be sufficient. According to the home secretary there are 30 companies deployed at present of which 15 companies are posted in Jehanabad alone. According to the SP of Jehanabad district there are, over and above the Bihar police, 2 companies of the Border Security Force, 1 company of the CRPF, and 10 companies of the Bihar Military Police (BMP). In addition, force from Gujarat Special Reserve Police have also been requisitioned. There is at least one battalion of the Border Security Force in the central Bihar area.

Alongside, there has been a dramatic strengthening of the Jehanabad district police. To accommodate the new increase in police presence, schools, primary health centres, and other public buildings have been taken over. In Arrain village, for example, the primary school is a BSF camp. But the most glaring example is the Jehanabad hospital. This has been taken over by the BSF. We could not find a patient or hospital staff in it. According to the Lok Sangram Morcha, there are 74 such police camps where 2,574 jawans of the paramilitary forces are stationed.

A PUDR team visited Jehanabad to make an independent study of the recent reports of violence in that district. The team visited four villages in Jehanabad where recent incidents of people being killed, beaten or arrested by the police have taken place. They are Penthith village, Bajitpur village and Azadbigha village under Karpi police station and Bhadasi village under Arwal police station.

Administration-Contractor Nexus

On November 15, 1988, three persons, two of them members of the Bihar Pradesh Kisan Sabha (BPKS), were killed in police firing during Chhat mela near Penthith village.

Penthith borders on the river Punpun. A small distance away from the village are two temples, one fairly old and the other built recently. This place is well known for its five annual fairs (*melas*) held during Kartik, Chaitra and *Makar-Sankranti*. As all fairs and *hatts* (village markets) in Bihar are auctioned out by the district administration, the organisation of these fairs too was auctioned to the highest bidder. The contract for organising these five fairs has been regularly going to Braj Mohan Sharma from the adjacent Kurtha block. It is claimed by the people that he enjoys administrative patronage. For several years BPKS has been agitating for taking the contract away from Braj Mohan Sharma. They allege that the tolls he collects from the stalls are exorbitant and that his musclemen extort money from the stall owners. Gambling pools and liquor stalls flourish during these *melas* and often women visitors are molested. The local people demanded that the contract for the fairs be given to a committee formed from among people of the nearby villages. To provide some security to visitors to the mela, the BPKS and the Indian People's Front (IPF) has been setting up an assistance *shivir* (camp) in each of these melas since 1984. This camp had become a regular feature of the fairs. Last year, as usual, the assistance camp was set up on the morning of November 15. The same day some officials and policemen visited the fair. A heated altercation took place between the BPKS activists and the officials, regarding the harassment of the visitors to the mela by Sharma's henchmen. Reportedly the circle officer agreed that the contract should not, if possible, be given to Sharma in the future and gave assurance that the administration would see to it that the harassment of people would not take place.

The next day a police camp was set up at the mela. While the BPKS set up its camp on a raised 7 feet high platform, on which the old Shiv Mandir was built, the police camped directly below the BPKS camp on the ground. All was seemingly well though there was some tension in the air. But suddenly late in the night a small explosive device went off next to the police camp. At the time when the explosion went off a large number of people were watching a cultural programme, while some BPKS volunteers had dropped off to sleep in their camp on the temple platform. According to the police, a bomb was thrown from the BPKS camp at the police. The police claim that the sentry on duty raised the alarm and the constables took position and fired at the people in the camp. The police point out that since the 'bomb' hit the side of the 7 feet high terrace it must have been thrown from above. According to BPKS supporters and eye witnesses somebody had deliberately set off a powerful fire cracker. They do not know who set it off nor from where it was thrown. One suggestion was that the police themselves had set it off in order to create an excuse for their action. Another explanation was that contractor Sharma had thrown it to create a panic and implicate the BPKS. At any rate the firing left three dead. Satandev Choudhary (45), secretary of the Jal Shramik Sangh, and a member of the district committee of the BPKS, was shot dead immediately. He was sleeping on the edge of the terrace, just above the police camp, and had been woken up that very instant by his brother who was another activist. Nand Yadav, a youth of 16-18 years of age, on a 'Chhat' fast was also shot dead. He was apparently not connected with BPKS. Sabaldeo Yadav (25), who was sleeping nearest to Satandev Choudhary also died that night. He was first shot in the leg, then as he ran towards the mandir for shelter he was shot again this time fatally. Rajendra Yadav, secretary of the village BPKS committee, and Ramesh Choudhary, a 23-year old man, were injured. Two people were arrested, who according to BPKS activists, were bangle sellers.

The official version contends that the intention of the BPKS was to scare the police in order to seize their arms. This account lacks credibility. First, there were no injuries to the police. Clearly the 'bomb' was a fairly innocuous firecracker. This the police too admitted to us. Secondly, during the time that the police took up position, there was no attempt to

attack them or to snatch their rifles. Thirdly, the trajectory, the police themselves claim, the 'bomb' took, makes no sense if someone 7 feet above them were to throw the 'bomb' vertically downwards. How can such a bomb ricochet off the platform wall? One of the possibilities, an administration official hinted at was that the police panicked. Even if the police did panic, they did not fire blindly. They had been conditioned to react in a certain way. They aimed deliberately at the raised platform above their camp, and in particular at the BPKS camp. It should be noted that there must have been about a hundred people on this terrace, including women and children. IPF activists say that when the policemen saw who had died, they were overheard saying that the main person got away. The bodies of the three persons who died were not returned to the relatives but were cremated by the police. According to the district magistrate this was done since no one claimed their bodies. However the team chanced upon a copy of an order made by the district magistrate directing that the bodies should not be handed over and that they be cremated quickly by the police after a speedy post-mortem.

This incident at Penthith points to the impunity with which the police violates all norms of legality, the utter callousness and disregard for the right to life and security, and the administration-contractor nexus. An officer of the district whom the team interviewed confided that there was pressure from the higher ups to second the police version of events.

Fake Encounter?

Bhadasi is a large village with 150 households. It lies about a kilometre off the main road connecting Imamganj to Telpa. There used to be a *kachcha* road connecting the village to the main road, but this has recently been metalled after the police action.

Most of the landless labourers in this village are Paswans, Kahars, or Rajmars. Yadavs and Muslims are the landowners in the village but they are middle sized landowners with holdings ranging from 2½ bighas to 15 bighas. About two years ago the minimum wages used to be 3 *seers kachchi* paddy (approximately equivalent to a little over 1 kg rice) and no meals were given. After the agricultural labourers organised under the BPKS and went on strikes the wages were raised bit by bit to 3 kilo rice with a *nashta* (snack). This is the situation there today. The other severe problem villagers used to face earlier was the molestation and harassment of their womenfolk, especially by the Yadav landowners. This is not to mention the dacoit menace in that area. All this has almost completely ceased due to the movement launched by BPKS. This village has organisations of both the BPKS and the Mazdoor Kisan Sangram Samiti (MKSS). Most of the agricultural workers are in either of the two organisations, though the BPKS appears to be relatively stronger here.

On November 27, 1988, a group of about 24 armed policemen of the BMP, led by *daroga* Imam Rashid, entered the home of Vakil Ram on a tip off that an armed squad was staying there. According to the police, when they entered the house from the rear entrance, the members of the squad opened fire on them killing the *daroga* on the spot. In the exchange of fire that followed three members of the squad were killed while the others managed to escape over a wall. The police recovered several fire arms and 'extremist' literature from the spot. Later a house to house search was conducted in the village and several people were arrested.

The version the local people gave us was different. According to them, five people described as '*sathis*' (comrades) were staying in Vakil Ram's house. At the time of the incident, only an old woman, Lakhpati Devi was in the house with them. Three of the people were eating in the *angan* (courtyard) while two others were bathing at the small well in front. All of a sudden a door leading outside from a back room was forced open and the *daroga* rushed in followed by some policemen. The people got up and ran to the front room and tried to open the door, but found more policemen outside. They shut the door and one of them picked up a hand gun. When the policemen entered and fired at them, this person fired back, killing the *daroga* on the spot. This person also sustained fatal injuries. Meanwhile, two of these five people had managed to escape by climbing over a wall and running away. According to the people, the two persons left inside did not die in the exchange of fire. They were caught by the police and shot afterwards. But the team had no way of ascertaining that.

After this incident, later in the day, more policemen accompanied by BSF jawans surrounded the village and went on a rampage beating up people including women and children. They ransacked houses of the agricultural labourers and destroyed their meagre household goods. Houses of better-off sections too were looted. Villagers allege that jewellery was stolen from their women. Rs 5,000 was allegedly stolen from the home of Madan, a BMP jawan who had come home on leave. His son too was beaten up. According to Jamil Mian, a relatively well-off resident, he was called by the police and beaten up too. The village bania's shop was broken into and money and goods stolen. The team met some women who were forced to take off the traditional silver ornaments and anklets by the police. We also saw huts in which doors had been broken, mud walls and *chulhas* (cooking hearth) smashed.

While in the absence of eyewitnesses it is difficult to decide the course of events of the actual killing, a few facts stand out clearly. The people visiting Vakil Ram's house had definitely some arms with which at least one of them fired back at the police. The police broke into the house without warning and no attempt was made to ask those inside to surrender. Since no actual breach of peace had taken place, the police had no basis to enter and start firing either. It is not possible with available information to ascertain whether all the three persons killed died during the exchange of fire. As mentioned above, villagers, including people not sympathetic to the peasant organisation, believe firmly that the two 'sathis' were killed later in cold blood by the police. According to Jamil Mian, as the three bodies were lying in a row before they were removed by the police, they must have been shot after they were captured. This is not wholly convincing. What however is absolutely clear is the rampage and looting the police indulged in after the firing. The police also arrested several people who are still in jail. They include Vakil Ram, the owner of the house, Shanti Devi, his wife, and their two children, aged 3 and 5 respectively. When we asked officials why such small children are in jail, we were told that the mother refused to leave them behind. This speaks volumes for the trauma that Shanti Devi has undergone.

Landlords Control *Gair Mazarua* Land

Bajitpur is about 10 kilometres from Bhadasi and quite far from the main road. The outlying *tolas* (settlements) of the Harijan and Muslim agricultural labour are however only about 1 km off the main road. There is a large stretch of wasteland between these *tolas* and the main road on a small part of which a weekly *hatt* (market) is held.

All the landowners of this village are Muslims. There are about five Muslim families with very large holdings. Mohiddin Khan cultivates 40 bighas of land, Ahmadi Mian cultivates 60 bighas, Halim Khan cultivates 50 bighas, and Rashid Khan cultivates 25 bighas. The agricultural labourers are either Muslims or Musaharas. There are about 40 Muslim houses of which around 30 families are agricultural labourers and others are artisans.

The large 90 bigha stretch of wasteland is called '*gair mazarua*' land (government

land). We were shown a map of a 1912-13 settlement report which showed a plot of 22 acres (Khata No 148, Plot No 446) as *gair mazarua* land. The adjoining plots were also *gair mazarua* according to the villagers. At the time of the 1971 settlement report the landlords 'produced' documents and had the plots transferred to their names.

In January this year, the landless labourers decided to take over this land. On January 12 they organised under the Mazdur Kisan Mukti Morcha and erected a red flag on the land and built huts around them. Around 30 huts were put up for 2 Muslim agricultural labour families, 15 Paswan families, 5 Musahar families and for about 8-10 other Dalit agricultural labour families. The next day the police came and smashed all the huts. The people then went and met the LRDC. On January 20 a meeting was fixed in the office of the LRDC where both parties were called. According to the agricultural labourers, when the LRDC saw the papers the landlords presented he said they were fake and wrote so on the papers. Another meeting was fixed on January 23 but the labourers were not allowed inside the office and only the landlords were given a hearing. The labourers were sent back after being told that the LRDC would come himself to the area to see the spot. On January 30, the local people decided that they had waited long enough and again erected huts on the disputed land. The next day the huts were smashed again by a police force. The policemen beat up several women quite badly and smashed up utensils. The team was shown smashed cooking pots, pails and other utensils. Goods worth around Rs 1,500 were destroyed by the police. On February 2, these agricultural labourers took all the utensils to the DM. On February 5 the police came again and threatened the villagers not to tell anyone about what had happened.

Arbitrary Arrests and Torture

The team visited Basata *ka tola*, the dalit *tola* (settlement) of Azad bigha village from where Amarjeet Singh Sohi, the cultural activist from Punjab was arrested on November 14, 1988. There are around 82 households in this *tola*, all of whom are landless. Twenty-two houses are of Rajmars, 45 households of Manjhis, 12 Paswans, 1 Dhobi and 2 Nais. All these families are landless agricultural labourers for the surrounding large landowners. The two largest landowners are Balu Prasad Singh of the main village, who owns about 80 bighas, and the *Mahant* of the Deokund Matt who owns about 250 bighas.

Deokund Matt is a nearby religious place. The land legally belongs to the Matt, but is in the possession of the Mahant and most of it is cultivated by tenants. There are about 250 bataidars on this land. The remainder is cultivated directly by the Mahant who employs 5-6 Banihars and also casual labour from nearby villages. The village is Rajput dominated, having around 40 landowning Rajput families.

Agricultural wages in this village used to be 2½ seer *dhan kachchi* (1,350 gms of paddy, equivalent to less than a kilo of rice) with no meals for casual labour and 2 seer *dhan kachchi* for the Banihars employed under *halwaha-charwaha* systems. The interesting feature about them is that they are also given a small plot of land, usually 10 *kathas* for self-cultivation. Last year, however, the agricultural labourers organised under the Mazdur Kisan Mukti Manch and went on a 10-day strike during the harvest season. Their wages were then raised to 3 kgs of rice with a meal for casual labour (though women labourers are still not given a meal) and 3 kgs of rice along with the 10 kathas of land for the Banihars. According to the agricultural labourers we interviewed, on the night of November 13 and 14 about 40 activists and sympathisers of the Mukti Manch had gathered in this village to chalk out a plan to demonstratively seize land of the *Mahant* of Deokund. Earlier, a large number of agricultural labour had gone and planted a red flag on the 85 bighas owned and operated by the *Mahant*. The flag was however pulled down by the *Mahant's* men. The peasant organisation had also made representations to the administration asking them to distribute the excess land, but to no avail. The meeting ended at about 2.30 a m. Most of the people went back to their own villages, but a few stayed on to sleep for the night.

At about 3 a m, the police surrounded the village and raided the hut in which the meeting had taken place. There they found Amarjeet Sohi, and a few others, who were promptly arrested. In the early hours of the morning fresh police reinforcements arrived including a large number of BSF jawans. The policemen then raided every house in the *tola* and arrested every male they could find. Since most of the men had run away, the police could arrest only about 20 of them. In all 25 people were arrested including Amarjeet Sohi. Twenty belonged to this village and four belonged to nearby villages. The villagers also alleged that the police took away small sums of money found in the huts.

Amarjeet Sohi has been charged with sedition under the arms act and under the terrorist act. The police have said that he is a Canadian terrorist who had 'infiltrated' into the country to provide training to the Naxalites in Bihar. In actual fact, the 26-year old Amarjeet Singh Sohi hails from Sangrur district in Punjab. A few years ago he had gone to Canada to join his elder brother who is a resident there. Amarjeet Sohi became active in the Punjabi Sahitya Sabha, a cultural organisation very critical of the Khalistani terrorists in Punjab and of their supporters in Canada. Both Amarjeet Sohi and his brother had been threatened by them in the past. This organisation has contacts with Gursharan Singh and the Amritsar School of Drama directed by him. Thus when Sohi came to India for a visit he became active in this drama troupe. When he learnt that some members of the Revolutionary Centre were going to Bihar to attend the inaugural meeting of the Lok Sangram Morcha in Dalmia Nagar, Rohtas district, he decided to accompany them. He then decided to stay on in order to study the peasant movement for himself.

The treatment meted out to Amarjeet Sohi after his arrest is reprehensible. According to one description, R R Prasad, DIG (CID), who was among the senior officials who had come to interrogate Sohi, personally tortured him. According to this information, Sohi was bunched up on the ground. His hands and feet were tied and the DIG was kicking him and beating him and swearing abuses at him. So far the police has found no information against Sohi. The only thing they have is a photograph which they claim shows an armed squad. They have also recovered some pamphlets from his possession along with other 'extremist' literature such as Bhishm Sahni's 'Tamas', and Avtar Singh Paash's poetry. They are therefore keen that he be booked under the NSA so that his case does not come up in court.

The police officers, intent on forwarding their careers, painted Sohi first in Khalistani colours and then in bright red. It was the DM of Jehanabad who ultimately came to Sohi's relief. Prasad was not allowed to continue with his brutal methods and according to one eyewitness, Prasad protested loudly. We also have it first hand from the secretary, home department in Patna on February 6, 1988 that the government was certain that Sohi was either a Khalistani or an agent of the 'dreaded left wing organisation' IPANA, in Canada. But only a few hours earlier the then DM of Jehanabad said there was just no proof to believe that Sohi was a Khalistani nor that IPANA was really a dreaded organisation promoting Naxalism in India. It is most interesting to note in this connection that the DM of Jehanabad who refused to let Prasad, DIG (CID) of police, to torture Sohi, was transferred early in February.

[This account is based on the report of the People's Union for Democratic Rights.]

China: Political Background and Prospects

J Bruce Jacobs

The leadership in China remains deeply divided. Many leaders in the centre, at provincial levels and in the localities support economic and political structural reform and even support some reduction of ideological rigidity. While these people, probably a majority, must now lie low, the habits of the past ten years will not die too quickly.

FOR many years there have been clear lines of political conflict in China. In the early to mid-1970s, three groups contended to succeed chairman Mao Zedong, who finally died in September 1976. The first group, the 'conservatives', had led China in 1950s and early 1960s, but then suffered severely in the Cultural Revolution. Premier Zhou Enlai later brought them back to senior positions in order to restore some economic growth and political order. Deng Xiaoping was an important leader of this group, which also included an important part of the military. The second group consisted of people who benefited from the Cultural Revolution, such as Hua Guofeng, a provincial official who worked in Mao's native area and whom Mao raised to national level. Hua eventually became Mao's chosen successor. The third group, the 'radicals', had supported many of the Cultural Revolution policies and later became known as the 'Gang of Four'.

Shortly after Mao died, the first two groups formed a coalition to oust the 'radicals'. This coalition lasted for a few years until Deng Xiaoping could purge the second group, which had become known as the 'whatever faction' because they advocated the 'two whatevers'. "We must steadfastly uphold whatever policies Chairman Mao made; we must unswervingly abide by whatever instructions Chairman Mao gave."

Beginning in December 1978, the 'conservatives' under the leadership of Deng Xiaoping began to steer China on its post-Mao reform course. Yet this 'conservative' group now divided into two groups, the 'reformers' and the 'conservatives'. The Beijing massacre is one attempt to resolve their conflict, which has lasted for over ten years.

The 'conservatives', who include Li Peng, Yao Yilin, Peng Zhen, Chen Yun, Li Xiannian, Yang Shangkun, Hu Qiaomu and Deng Liqun, tend to stress the leadership role of the party, the importance of central planning and state ownership, and the relevance of ideological orthodoxy. The 'reformers', who have included Zhao Ziyang, Wan Li, Hu Yaobang, Tian Jiyun and, perhaps, Hu Qili, have favoured such reform proposals as minimising the role of the party in government and the economy, emphasising the collective and private sectors of the economy, using the market to create efficiency, increasing foreign trade and foreign investment to stimulate the Chinese economy and, to some extent, 'liberating thought' (*jiefang sixiang*).

Many Chinese as well as foreigners tend to see these two positions as complete programmes. In other words, they believe a 'reformer' or a 'conservative' would advocate all of these respective policies in a systematic way. However, we can distinguish three different policy arenas and discover that some people advocate a reform position in one area and a conservative position in another.

The first policy arena concerns 'economic reform'. Those advocating 'economic reform' favour the responsibility system in agriculture and industry, Chinese-foreign joint ventures, and foreign investment. The second policy arena concerns 'political structural reform'. Its advocates desire "separating the party from government" and "separating government from the economy". Those advocating ideological reform, the third arena, do not simply wish to change slogans. Rather they wish to de-emphasise the importance of 'unified thought' and allow at least a limited range of ideas to compete against each other. The 'conservatives' want 'unified thought', which means the centre determines what is 'correct thought', which everyone must then accept. Of course, since 1949 such centrally-determined 'correct thought' has often proven quite incorrect.

I would argue that basically Deng Xiaoping has supported economic reform and political structural reform, but has insisted on ideological orthodoxy. He is not, and never has been a 'small-d' democrat. In an important speech he gave on December 30, 1986, in the context of the student demonstrations of late 1986 and early 1987, he said: "We cannot but have dictatorial methods. We must not only talk about dictatorial methods; when necessary we must also use them. Of course, when using them, we must be prudent and arrest as few people as possible." Unfortunately, in his senility, Deng Xiaoping has lost his prudence.

It became clear at the 13th National Party Congress held in October-November 1987 that the 'reformers' held a large majority of positions in higher levels of the party. Important conservatives like Deng Liqun lost their races for the central committee at the party congress. Yet deals had been done beforehand, and a preponderantly conservative leadership, which included the choice of Li Peng as the premier, won election to senior party and government positions.

The selection of Li Peng as premier raises one of the central issues concerning China's 'pro-democracy' students—nepotism. Contrary to western reports, premier Zhou Enlai and his wife Deng Yingchao did not adopt Li Peng. Li's father was killed in the revolution, but Li's mother survived and raised Li. However, when he went to school, Li Peng, as well as some other children did live with the Zhous. A story widespread in China in 1987 said Deng Yingchao, a power in her own right who had previously served on the political bureau of the party, went in tears to the leadership and said it was premier Zhou's last wish that Li Peng should be premier. (Recently she is reputed to have opposed the use of force against the students.) Like Li Peng, many senior Chinese leaders do not hold their positions because of any competency, but because they are the children or grandchildren of senior party leaders.

In considering recent events we must not forget the power of the military and the security agencies. China has a long history of civilian control of the military. In the imperial periods, civil officials led many important military expeditions. Chairman Mao, too, emphasised civilian control of the military with his famous quotation: "Political power grows out of the barrel of a gun and the Party controls the gun." In fact, under the Chinese communists, the military has wielded enormous influence. In the early years of the People's Republic, from 1949 to 1954, the military played a key role in establishing and administering the new political system. The military also played a very important role during the Cultural Revolution when it intervened between com-

peting factions and began to control the revolutionary committees, China's administrative apparatus. Until Mao died, in over half of China's provinces, the provincial party first secretary, the key person in each province, was a military man. We must also remember that Lin Biao in September 1971 attempted a military coup, an indication of the military's strength and importance in the political system.

Deng Xiaoping used the military to win control after Mao died, but then he decided to reduce the military's staff and budget. Arguing that China could not afford both guns and butter, Deng told the military it would be better first to build the economy; later, with this larger economy, the country could afford more military expenditure. In fact, many of the claimed staffing reductions did not occur because numerous demobilised military units simply became units of the armed police.

We must also remember that security agencies have been an integral part of the Chinese communist regime since the halcyon days in Yanan when so-called 'democracy' and the 'mass line' were emphasised. In fact, the Chinese communists then relied on a Stalinist secret police, which is still important.

In looking at recent events, it is instructive to remember that the Chinese communist regime has consistently supported the Khmer Rouge even after the revelation of the latter's atrocities. And this regime has not hesitated to use violence against Tibetans, who the regime claims are Chinese.

What are the prospects for Chinese politics? The leadership in China remains deeply divided. Many leaders in the centre, at provincial levels and in the localities support economic and political structural reform and even support some reduction of ideological rigidity. While these people, probably a majority, must now lie low, the habits of the past ten years will not die too quickly. As noted, the elections at the 13th National Party Congress indicated a willingness to speak up. Similarly, at the National People's Congress and in local People's Congresses (China's legislatures), people have spoken up and opposed central party policy. On April 5 this year, over ten per cent of National People's Congressmen and women voted 'no' and another thirty per cent abstained in voting on a proposed law which the leadership supported. Perhaps we can also take heart from the attempts in the last ten years to emphasise a 'rule of law' and the implementation of 'procedures'. I believe these have met a responsive chord among a large number of Chinese and while a dictator and/or military force or security forces can easily overwhelm attempts to act according to 'the rule of law', there appears to be substantial support within China for return to a less arbitrary political system.

Predicting politics is quite difficult China will have a few difficult and sad years until the old leaders like Deng Xiaoping and Yang Shangkun die. After the old leaders die, younger leaders like Li Peng and Jiang Zemin will find it difficult to sustain their positions because they lack independent power bases. Chinese politics will be extremely fluid, but it is not difficult to see a reform-minded leadership coming to the fore again. On the other hand, we must never forget the existence of the powerful repressive military and security agencies. We must await the death of the old men to see how the complex web of Chinese politics develops.

China: At the End of the Capitalist Road

Neville Maxwell

Mao foresaw that the policies of the 'capitalist road' would turn out to be a short-cut to catastrophe for the country, leading it into economic collapse and social disorder. That took just over a decade. The 'reforms' which have been so applauded by Deng Xiaoping's western claque, have left China facing a long period of division and turmoil.

> It was a pig walking on its hind legs. Yes, it was Squealer. A little awkwardly, as though not quite used to supporting his considerable bulk in that position, but with perfect balance, he was strolling across the yard. And a moment later, out from the door of the farm-house came a long line of pigs, all walking on their hind legs... And finally there was a tremendous baying of dogs... and out came Napoleon himself, majestically upright, casting haughty glances from side to side, and with his dogs gambolling round him.
> He carried a whip in his trotter.
>
> George Orwell, *Animal Farm*.

IT is difficult to think of a political event that has been the subject of greater misunderstanding in the west than has the Tiananmen demonstration and its brutal suppression by the Chinese government. Forgetting the politics of the Chinese revolution, making it an act of faith that Deng Xiaoping's 'reforms' have brought great benefit to China and that the Chinese simply demand more of them, western observers and analysts have seen what they wished to see: an oriental replay of eastern Europe's rejection of communism.

The west's failure of analysis is signalled by the wild semantic confusion, degenerated now into utter garbling, of its descriptions of post-revolutionary China's political factions: 'radicals', 'conservatives', 'reactionaries', 'hard-liners', the labels and their wearers have switched and shifted bewilderingly. The ruling faction in China, best named as Dengist, has of course deliberately added to the confusion with its own chameleon verbal camouflage, first presenting itself as upholders of Mao Zedong against those they called his enemies and theirs, the 'gang of four'; then, with the power they took through the 1976 *coup d'etat* consolidated, moving through repudiation of the Cultural Revolution to tacit rejection of Mao himself—a 'mad recluse', they told us, for the last 19 years of his life; and finally Deng, to justify his repression, is found parroting the language of his own Cultural Revolution tormentors and labelling his victims 'counter-revolutionaries'.

Keys to clarify the confusion are available. The most detailed, accurate and sophisticated lies in the writings of China's 'Maoists' but for those who find such a source suspect *Animal Farm* will do. The Aesopian morals of that great political fable are two: that revolutions are born infected with the virus of counter-revolution, i e, those who lead the structuring of a revolutionary society can become a class whose self-interest is served by its undoing; and that in this age counter-revolution will always present itself as revolution continued. In Orwell's terms, the 'pigs' of the Chinese revolution seized power in the later 1970s, and instituted policies of restoration and regression which progressively reversed the achievements of the previous three decades; and of course in the 'human' world outside the farm these 'reforms' and the humanoid antics of the pigs, on golf course and in rodeo stage-coach, were

MANSINGHKA PRATISTHAN

TRI-STAR SOYA PRODUCTS LIMITED

Speech delivered by Shri M.P. Mansinghka, Chairman, at the 9th Annual General Meeting of the Company held at Bombay.

Ladies and Gentlemen,

I have great pleasure in extending to you all a warm and cordial welcome to this 9th Annual General Meeting of the Company. The Directors' Report and audited accounts of the company for the 8-month period ended March 1989 have been with you for quite some time and I hope you have studied those in your usual careful manner. When we met last on 30th December I had indicated about the distinctly favourable turn in the fortunes of your company which had been ravaged by severe financial drought for two consecutive years owing to an acute shortage of raw material. As you must have seen from the directors' report, the company's performance during 8-month period has been much better than envisaged earlier. The company has set altogether new records in production, sales turnover, exports, profits and profitability.

(Rs. in crores)

	8 months ended 31.3.89	12 months ended 31.7.88
Production (in tonnes)	61,671	42,793
Turnover	39.52	22.65
Export	15.11	7.66
Net Profit	2.24	(–) 1.97
Earning per share (in Rs.)	8.97	(–) 7.88

While I hardly need repeat here the relevant figures highlighting the company's spectacular achievements, it is well worth mentioning that your company's performance compares very favourably with that of other companies engaged in soyabean processing. If you have had again to go without a dividend this time even when the earning per share based on profit during 1988-89 works out to Rs. 8.97, it is simply because of the carryforward loss of the preceding two years which has now been reduced from Rs. 2.69 crore to only Rs. 0.79 crore. There is every reason to hope that the company will be in a position to return to the dividend list next year.

On present reckoning, the outlook for the current year can be regarded as very reassuring. During the first three months-April-June the company has been able to process 19700 tonnes of soyabean/expeller cake and has achieved a turnover of Rs. 12.1 crores (inclusive of exports of Rs. 6.9 crores). Despite considerable erosion of margins due largely to the decline in soya oil prices in the domestic market, the company has been able to maintain its profit at a reasonable level, the figure for the first quarter being Rs. 30.75 lakhs.

As you are well aware, in an agro-based and export-oriented industry like soyabean processing, raw material supply and the international environment are the two key elements in determining its fortunes. While nothing can be taken for granted, all indications, according to the meteorological department, point to a normal monsoon. The progress of the south-west monsoon so far has been very satisfactory. Considering the very useful work carried out by the Technology Mission in improving the organisational set up for the timely supply of the various crucial farm inputs it would not seem unduly optimistic to look forward to a further increase in the record kharif oilseeds production, including soyabean, in 1989-90. With assured raw material supply next season, the company should be in a position to further improve upon its 1989-90 performance.

In an increasingly competitive environment, continuous upgradation of technology is a must for improving cost efficiency as also the quality of the product. In this context I would like to mention that the United States has developed a technology by which the usage of expellers is eliminated and one can process high yielding varieties of oilseeds, direct by solvent extraction processing. The quality of oil, obtained is far better than expeller oil and the yield of oil is also higher. What is even more significant is that the cost of production is almost half. This technological innovation has brought about a virtual revolution in the oilseed crushing/processing industry.

You will be pleased to know that your company has decided to adopt this latest technology and hopefully the plant will have incorporated this technology before we meet next. The induction of this technology will impart great flexibility to the plant enabling it to process various oilseeds in our unit which in turn will make possible fuller utilisation of the installed capacity and thereby reduce considerably overhead costs.

In order to finance the modernisation programme, your company has decided to issue 10 lakh equity shares of Rs. 10 each at par on a Rights basis in the ratio of two shares for every five shares held. The letter of offer will be mailed to you shortly. I am sure you will find the Rights offer at par pretty attractive. I look forward to your enthusiastic participation in the company's growth.

You will be pleased to know that your company is now a recognised trading house. This will help improve the company's profitability.

I think this speech will seem incomplete if I did not make a brief mention of the well-conceived integrated policy for oilseeds aimed at accelerating the move towards self-reliance by helping growers without unduly hurting consumers. Creation of a buffer stock of five lakh tonnes of edible oils through indigenous procurement as well as imports and prescription of a price band – Rs. 20,000 to Rs. 25,000 a tonne – for the two major oils, namely, groundnut oil and rape-mustard oil constitute the key elements of the policy. It is unfortunate that the government should have failed to fulfil its commitment in regard to either of these. Six months have gone by since the announcement of the policy early in January. But rape-mustard oil is still quoted about Rs. 5,000 a tonne below the Rs. 20,000 a tonne mark. Quite apparently, procurement effort has not been adequate to absorb the available supply to achieve the price band objective or the buffer stock target.

Whether the government should have prescribed the same price band for rape-mustard oil as that for ground nut oil when the former had generally been quoted well below the latter is a moot point. However, if the government were really earnest about enforcing the minimum price in respect of rape-mustard oil and it found that the NDDB and the other state level agencies were unable to carry out procurement operations on the requisite scale it should have done away with the ceiling on stocks of oilseeds and oils under the storage control order and further relaxed selective credit control to enable the private trade to build larger inventories and also allowed the vanaspati industry to use rape-mustard oil freely in the manufacture of vanaspati. The government could reimpose the ceiling when the objective was achieved and prices threatened to pierce the upper limit of the price band.

If oilseeds production next season turns out to be higher than in 1988-89, the government will need to take effective steps right now to ensure improved management of the vegetable oil economy. The implementation of the 'integrated' policy has brought into sharp focus certain conceptual deficiencies and inadequacies in the organisational infrastructure and these merit special attention.

Before I conclude, I would like to place on record my sincere thanks to all our shareholders for the trust and confidence reposed in the Management, the Financial Institutions and Bankers for their wholehearted assistance in helping achieve our objectives, and to the Central and State Governments for their co-operations.

I would also like to extend my sincere thanks to my colleagues on the Board for their valuable advice, all the Workers and Members of the Staff and Officers of your Company for their continued diligence and dedication.

Thank you very much.

Note:–
This does not purport to be a report of the proceedings of the Annual General Meeting.

Sobhagya-8/89

rapturously applauded.

Whether Mao ever know of *Animal Farm* is not known, but he certainly lived it.

The Chinese Communist Party fractured almost immediately after its triumph in 1949. The coalition of classes, which Mao had put together and which overwhelmed the decadent Guomintang regime, divided over China's future road, in what appeared at first to be mere difference of priority. But the differences in fact were absolute. For the Dengists (whose first leader was Liu Shaoqi) the pre-eminent task was that of building China into a powerful modern state, and the natural leaders—and prime beneficiaries—of that process would inevitably be the bureaucracy, allied with the intelligentsia, reinforced with elements from the old order and supported by whatever friends could be won abroad. In a term, a new bourgeoisie—but one that was to be controlled, strictly when necessary, by the Communist Party.

In that scenario, the peasants would put down the arms with which they had won the revolution, take up again their sickles and hoes, and toil as usual until the benefits of modernisation began to trickle down into the rural sector. Even then, there would be other levels of filtration: a renascent rich-peasant and potential landlord class in alliance with urban interests would have to benefit first in order that agriculture could generate the surpluses needed for industrial modernisation.

For the Maoists, the task was to build society in the interests of the peasants and the workers, whose numbers would rapidly grow as China industrialised. So far as the peasantry was concerned, Mao's confidence that they potentially had an inexhaustible enthusiasm for socialism was vindicated in the extraordinarily compressed saga of the 1950s that carried rural China from the small-holding agriculture which land distribution had extended and revivified—and which Mao recognised as the route back to stagnation and poverty for the majority—through primitive and then sophisticated stages of co-operation and, with accelerating pace, into collectives and the newly conceived people's communes with their enormous potential for sustained, comprehensive and flexible development.

That triumph, with the secular increase in agricultural production and the rescue from poverty of the majority of the peasants, say 60 per cent, in a mere 25 years, the Dengists have had to deny and belie in order to substantiate their false claim that they inherited from Mao a failed agricultural strategy, and that their reforms had to be introduced to save an economy on the point of collapse. Credulous specialists in the west, well-disposed towards the 'reformers' who were so eager to learn from them, have been glad to accept those formulations.

It became apparent in the early 1950s that the growth-at-all-costs strategy for China's development, which would reverse the revolution's egalitarian thrust and jeopardise the country's new-won economic independence, enjoyed committed support in the communist leadership. That the strategy they sign-posted 'capitalist road' would lead to a shot-in-the-arm surge of rural prosperity the Maoists recognised, accepting that it would therefore have powerful appeal to many peasants; but they foresaw that its beneficent effects would be short-lived, bought at the cost of the factors for long-term growth that collectivisation had built into the rural economy.

Through the 1950s and especially after the first years of the 1960s when the Dengist faction of the party had the opportunity to introduce, tentatively, what later it could impose as 'the reforms', Mao evolved an analysis of his opponents' policies that carried on into diagnosis of their class affiliation. By the mid-1960s the Maoists had concluded that a new bourgeoisie was emerging in China; and that the peasants and workers who constituted the vast majority of the society were in a relationship of conflict—class conflict—with the bureaucrats who formulated the policies that shaped their lives, and with the groupings interlinked or in common cause with the bureaucracy: professionals, intellectuals, party cadres, especially those of the higher ranks, and their families.

The Cultural Revolution was the Maoists' counter-attack against that emergent class, whose hostility to the revolution could be inferred from their policies although it was of course denied in their rhetoric. Although it appeared at first that the Cultural Revolution had succeeded in consolidating and advancing the egalitarian principles and practices that served socialism, the power of the Dengist right of the Communist Party was not broken, merely put to tactical retreat. By the mid-1970s the Cultural Revolution was on the defensive, the right resurgent. In 1976, the year of his death, Mao was quoted as saying of China's cadres: "You are making the socialist revolution, and yet don't know where the bourgeoisie is. It is right in the Communist Party—those in power taking the capitalist road. The capitalist roaders are still on the capitalist road."

Indeed they were. Only a month after Mao's death they struck, in a classic praetorian *coup d'etat*. Unit 8341 of the PLA, charged with the safety of the national leadership, was turned against the left, and China's great reversal, its Restoration, began. As Mao had foreseen, once the right had full power in the party leadership, the purge of the left would be easy to achieve and China could be made to 'change colour'. Mao foresaw also that the policies of the 'capitalist road' would turn out to be a short-cut to catastrophe for the country, leading it into economic collapse and social disorder. That took just over a decade.

The problem, from the Dengists' point of view, was that if the Communist Party is used to bury socialism it changes into something very different and becomes a Stalinist or even fascist party. The students in Tiananmen knew, as do most Chinese, that the party has become corrupt and alien, and believed perhaps that it had also become impotent and irrelevant. They forgot that Deng had made much of the 'professionalisation' he intended to work on the army, so that it would no longer be a 'people's liberation army', custodian of moral and social values, but learn to goose-step and to obey, like any other third world force. Deng himself is best seen now, for all his claims to have put down a 'counter-revolutionary rebellion', not as a communist but as the Shah of China.

The 'reforms', which have been so consistently applauded by Deng Xiaoping's western claque, have left China facing a long period of division and turmoil. Deng's new model army cannot be used successfully as an instrument of coercive government for China as a whole, and the process of political disintegration that has begun cannot readily be reversed. The problems facing Beijing were enormous and beyond resolution even before the students took to the Square: not only an economy out of control and a currency threatened by accelerating inflation but, deadliest of all, an acute grain shortage that is the direct consequence of the decollectivisation of agriculture. China would need a coherent, effective government with the support of a united people to steer a way to national survival through the rapids into which the 'reforms' have led it. As it is, with the only alternatives being repressive military rule or challenges by force that could lead to civil war, China faces an ineluctable regression into the disorder, fragmentation and renewed mass poverty from which its revolution once rescued it.

Nehru and the Visvesvaraya Legacy

Vinod Vyasulu

Against the background of the ongoing discussions on the Nehru legacy, this note seeks to examine one important strand in the legacy that Nehru himself inherited—the work of Mokshagundam Visvesvaraya in the princely state of Mysore in the early years of the 20th century—and to see to what extent he was influenced by this earlier legacy and to what extent he developed it further.

I

NEHRU's achievements and contributions are widespread. Confining attention to economic matters, his achievements seem stupendous. Nehru was the chairman of the Economic Planning Committee of the Congress Party before independence. He was familiar with the various views expressed on issues of planning, such as the Industrialists' or Bombay Plan of 1944. After independence, he constituted the Planning Commission as an independent body to render expert advice. Together with the Indian Statistical Institute, the Planning Commission did an enormous amount of excellent work in the field of planning—not only in the theoretical structure that led to the Second Plan, but in a number of related areas as well. If there is one area in which India is at the forefront of research on a global scale, it is in planning.[1] At least some of the credit for this should go to Nehru. Further, to obtain political acceptance of the plan, the National Development Council was constituted and it worked well enough in the early years.

Apart from the institutions of planning, Nehru was also responsible for the setting up of productive public sector enterprises outside the government, as it was felt that departmental undertakings were not suited for commercial operations. The Industrial Policy Resolution of 1948 was meant to reassure foreign capital. The IPR of 1956 took a more positive approach to what the state could do, and defined the role of the public sector which was to invest in core sectors that required huge investment and long gestation periods. Hindsight apart, Nehru contributed a great deal in the early years of independence to setting up institutions and creating healthy conventions that are essential for progress.

In trying to understand the Nehru legacy today, it would be useful to understand also the legacy inherited by Nehru and which formed the basis on which he made his own contributions. This, however, will be an ambitious task well beyond my competence to undertake. There may have been useful lessons from the experience of Baroda, and its Diwans, for example, V T Krishnamachari. What is therefore proposed in this paper is to examine one important strand in the legacy that Nehru inherited and to see to what extent he was influenced by this earlier legacy, and to what extent he developed it further. I refer to the work of Mokshagundam Visvesvaraya in the princely state of Mysore in the early years of the 20th century.[2] Visvesvaraya is well known as an engineer. It is clear however that he may also be seen as an economist and a pioneer in India's planning efforts. He was also elected for a term as president of the Indian Economic Association.

As the Diwan of Mysore state and as perhaps the most accomplished engineer of his times, he has made major contributions in various fields. These include the design of drinking water and sanitary systems of many cities including both Hyderabad, the capital of Andhra Pradesh, and Hyderabad in Sind, and Karachi, now in Pakistan. He made contributions to systems of flood control in Orissa and to the generation of electricity in Mysore and elsewhere. He was associated with Tata Iron and Steel Company in Jamshedpur and was the founder of what is today known as the Visvesvaraya Iron and Steel Company in Bhadravathi. He played an important role in the economic development of Mysore. In brief, he was a man whose accomplishments at the level of a princely state which was under indirect British rule may be seen as parallel with those of Nehru on the larger canvas of the nation, fifty years later.

The contributions of Visvesvaraya were well known to Nehru.[3] In 1936, Visvesvaraya had submitted a major proposal on nation-building to the Congress members of the Bombay legislature of which province B G Kher was then prime minister. This was elaborated on and published later for wider circulation. He was also a member of the Congress Committee on Planning of which Nehru was chairman. Visvesvaraya like Nehru, was a Bharat Ratna of independent India. Visvesvaraya's centenary was celebrated in 1960, and fortunately enough he was alive at that time and his brief memoir written in 1959 makes fascinating reading. Prime minister Nehru presided over the centenary function in Bangalore on September 15, 1960.

II

Visvesvaraya was in the service in the Bombay presidency as superintending engineer, sanitation, from which he took early retirement so that he could contribute freely to society, as he saw fit, without the constraints of office. He decided to live in Mysore, and was persuaded to join the government as chief engineer. Being an active person, he was deeply involved in the policies of the state in which he lived, especially in the promotion of education and industry, which he made a condition for accepting employment. He was invited by the Maharaja of Mysore in 1912 to function as Diwan. He had travelled widely in Europe, the United States and Japan and had experience of work in both British India and the princely states, and in the management of industrial concerns. He can be considered the father of management science in India.

His writings are full of references to the process of development, especially the process of industrialisation that took place in the advanced countries of Europe, the US and Japan; and he repeatedly stresses the gaps between these industrialised countries and Mysore in particular, and India in general, and the need to catch up by following their policies. From his 1934 book, *Planned Economy for India*, it is clear that Visvesvaraya appreciated the importance of estimating national income, and that he understood the structural changes that take place in an industrialising economy, especially the secular decline in population dependent on agriculture. For Visvesvaraya, industrialisation was the means to an end—the end was a society in which citizens enjoyed a clearly defined minimum level of social services: a minimum level of education, a minimum level of health, certain guaranteed opportunities to contribute to productive work. He also believed that these were best provided at the local level, and made elaborate suggestions for local self-government systems. As an enlightened citizen of society, he believed that if this was to be achieved, the productive capacities of the economy were to be extend-

ed and while there was potential for growth in agriculture, the primary increase in productivity and output would come from industrial development. Industry would make possible both the ability to produce and increase production, provide employment and also make available a large number of goods at reasonable rates.

In his view, British policies were clearly responsible for holding India back, and greater autonomy—Dominion Status—was a minimum requirement for progress. This comes out clearly in his comments on the proposal to set up a Reserve Bank in 1934. He considered a strong nationalist state to be essential for industrial development. Such a state would follow policies similar to those of the UK, Japan, Germany, etc, and thus take the country forward.

His working life of about 75 years as an engineer-statesman was devoted to promoting this process both technologically as an engineer and administratively as a civil servant. Thus in the time he was responsible for policies in Mysore state, he concentrated his energies on training the population so that they could contribute productively in a rapidly industrialised society. In order to do so, he set up systems for the systematic collection of data and information at the district level. He started with the establishment of training institutions of higher learning and he made the patronage of the state available for a rapid growth of industry. Visvesvaraya was the first to set up a department of industries in India and he made plans for the setting up of a large number of units, many of which came up much after his term as Diwan ended. These include the five-tonne per day fertiliser (ammonium sulphate) plant at Belagola, the iron and steel plant, a soap factory, and many others. He believed that it was necessary to build up a base in the engineering industries and in heavy chemicals as these would provide the essential foundation for a more rapid development of industries. At the same time, he encouraged traditional industries in the districts as these would both provide employment as also satisfy the consumption needs of people in local areas.

To quote from the authoritative and pioneering work of Balakrishna,[4] "with the Diwanship of Sir M Visvesvaraya in 1912 there were signs of a transition... This was an epoch-making era in the history of economic progress in Mysore. The leading economic policy of the state during this period was one of direct undertaking by government of large industrial concerns. Schemes were conceived on a very large scale, and executed on colossal proportions. The Mysore Iron Works and the Krishna Raja Sagara Dam are two of the maior schemes which attained fruition during this period. This policy brought about a thorough reorientation in the industrial outlook of the people of Mysore... The justification of the policy consisted in the fact that even after a decade of encouragement, private enterprise was not sufficiently courageous to undertake large concerns..." It may be noted, however, that there was considerable controversy around Visvesvaraya's views—the debates between him and Alfred Chatterton, the director of industries, and Albion Banerjee, an official who temporarily succeeded him as Diwan, are fascinating. Visvesvaray's insistence on investment by the state has a clear Keynesian flavour for a writer in the early 20th century.

Visvesvaraya's plans have the clear-cut precision one would expect from an engineer. They are blue-prints for action. His ideas about society seem over-simple, even naive at times. A man who believed in efficiency, he may have found it difficult to understand social complexities, individual motivations and political forces.[5]

In his own words, the aim of any plan of reconstruction should be, first and foremost, to increase production and income, to bring into the country up-to-date machinery and render its use familiar to the people, to spread among them a knowledge of sound business policies, principles and practices, to extend mass education and to equip the leaders with technical skill and executive ability. In a brief note in 1959, he noted three achievements—the setting up of the University of Mysore, the first in an Indian state, the setting up of industries, especially the iron and steel works in Bhadravathi, and the setting up of systems to systematically gather statistical information in the districts of Mysore. From his ideas and suggestions, it is possible to argue that a base for the policies of the Second Five-Year Plan had been laid.

Economists have been aware of Visvesvaraya's contributions, but they have not been given much importance. In there comprehensive survey of Indian contributions to economic analysis, Bhagwati and Chakravarty refer to pre-independence ideas of planning, but do not discuss them further as they lacked a clear analytical base. Bhabatosh Datta[6] in his review of Indian contributions to economics in the twentieth century devotes three pages to Visvesvaraya's plan of 1934 which he opines was not original but was at the same time a competent marshalling of data and information by a none-economist. He points out a major gap in Visvesvaraya's analysis—the absence of demand estimates. He also comments that it is a remarkable effort for somebody working in the remote south.

A summary of the recommendations he submitted in 1936 to the Congress Committee on Planning is given in the appendix. It shows the base that he provided for the post-independence contributions of Jawaharlal Nehru.

III

Nehru had an important role to play in the freedom movement in a country that now consists of 800 million people, about half of whom are born after independence. He was clearly identified with the dominant stream in this movement and for over fifteen years after independence he had an opportunity under extraordinarily favourable conditions—good foreign-exchange reserves, good harvests, a societal consensus—to try and mould Indian society and build institutions in a manner that was consistent with the vision for which his generation had made so many sacrifices. Nehru was the main architect of important institutions in independent India; he contributed to Indian foreign policy, to secularism and nation building; and to the process of planning in its many dimensions. Yet, there were in the Indian freedom movement, figures like Gandhi, whom many may consider more important, but who did not live long enough after independence to leave a mark on post-independence developments. This is true also of other figures like Subhash Chandra Bose and Sardar Vallabhbhai Patel. Some, like B C Roy and C Rajagopalachari, became less important figures in the popular mind as time passed. Thus, in terms of opportunities both before and after independence, Nehru seems to be unique.

Nehru is known for his commitments to central planning as a solution to problems of development. The best example of Nehru's planning vision is the Second Five-Year Plan which was developed on the basis of a plan-frame prepared by P C Mahalanobis in a Planning Commission of which Nehru was chairman. It is well known that this framework was influenced by the Soviet planning experience. The essential logic of the plan was to increase the rate of investment and to invest primarily in the core sector, in machines to make machines which would make available the essential equipment necessary for the production of consumer goods at a later stage. The public sector was to be established through the creation of new enterprises and was meant to occupy the commanding heights of the economy. To complement this, there was a small-industries policy which was meant to provide employment, to meet consumer needs and also develop a large class of entrepreneurs. The private sector was also assigned an important role in the industrialisation process. In order to ensure

that finances were available, the Imperial Bank of India was brought under government control as the State Bank of India, Life Insurance was nationalised, and the Unit Trust of India was set up.

An important result of the Second Plan was the establishment of steel plants such as Rourkela, Bhilai and Durgapur. Other industries established as a result of this strategy were what is today called Bharat Electronics, Hindustan Machine Tools, Indian Telephone Industries and many others. Nehru regarded these as the temples of modern India which could be instrumental in contributing towards a strong and self-reliant nation. On the other side, Nehru believed in community development under which a vast network of self-government and local institutions was sought to be developed. Zamindari was abolished. In order to provide the technical manpower required for these industries and institutions, he was responsible for the establishment of the Indian Institutes of Technology and the Indian Institutes of Management, apart from the large network of laboratories under the Council of Scientific and Industrial Research. The Indian Council for Agricultural Research, which existed under the British, was expanded. The Science Policy Resolution passed by parliament in 1956 recognised the role of science in modernising Indian society.

It would appear from the brief sketch above that there was indeed a great deal of similarity between the strategies advocated by Visvesvaraya in Mysore in the first half of this century and by Nehru for the Indian union in the second half of the 20th century. Visvesvaraya had the advantage of a smaller canvas, but his vision was national. Like Nehru, he functioned in Mysore at a time when political forces gave him a certain degree of freedom that is not common. He was successful to a remarkable extent in creating and fostering co-operative linkages between different institutions. For example, the process of extracting oil from sandalwood was developed in the chemistry department of the Indian Institute of Science and this process was used in the sandalwood oil factory that was set up. Similarly, there was a close link between the Bhadravathi Iron and Steel Works and the department of metallurgy of the Indian Institute of Science. In fact, the process of destructive distillation of wood which was used to produce charcoal was at that time considered to be a pioneering industrial process (even though it ran into trouble due to changes in marketing conditions later on). Brazil is now moving towards this technology.

In order to ensure that the voice of industry was heard, he set up the Mysore Chamber of Commerce and Industry, now the FKCCI. In order to ensure co-ordination between the efforts of industrialisation and policies of government, Visvesvaraya set up the Mysore Economic Conference which would deliberate at least once in a year on the major issues of policy for economic development—irrigation, agriculture and education, and industry and commerce. The Mysore Economic Conference thus performed a function similar to the Planning Commission in the 1950s. Bhabatosh Datta notes that the Planning Commission set up by Nehru performed functions similar to those recommended by Visvesvaraya in his 1934 plan.

When Visvesvaraya found that technical and skilled jobs were being dominated by the Brahmin community, he set up a revolving fund to award scholarships to meritorious students of other castes and very soon the Mysore University produced skilled engineers and others from the non-Brahmin castes who could claim their rightful share in society. Nehru, on the other hand, was a champion of the reservation policy, in which a certain percentage of jobs and opportunities were reserved in the constitution for the oppressed castes. Visvesvaraya, like Nehru, emphasised the importance of education and commerce. He regretted that universities were not awarding degrees in commerce and other job-related areas. Nehru expanded the educational system and tried to link it to planned development.

When it comes to an assessment of Nehru it is much more difficult to see what was achieved. First, we do not have the advantage of distance in time. Second, there can be many interpretations as to what was being sought to be achieved and what was actually achieved in recent years. Nehru had an emotional involvement in the planning process stemming from what has been called socialist ideals. Nehru believed that he was trying to build a socialist pattern of society, but what was achieved was state-led capitalism.

Visvesvaraya, on the other hand, though an admirer of the first Soviet plan, was very clear that this was not what India needed, not even what he called state socialism. "Having regard to the conditions prevailing in India, it is safe for this country to proceed along the lines practised in such countries as France and the US. India resembles France in the small size of the agricultural holdings and the US in the large size of the country and the magnitude of its resources, particularly manpower. We have yet to build up some measure of moderate industrial prosperity and for the present, capitalism is best suited for that purpose." Visvesvaraya's biographer, V S Narayana Rao, reports that he was a critic of Nehru's industrial policy, but does not give details.

The linkages between institutions did not work as Nehru would have liked them to have. The engineers produced in the IITs could not be quickly absorbed in Indian industry and this resulted in a stream of Indian engineers going abroad. This is true also of the graduates of the best schools of medicines such as the all-India Institute of Medical Sciences. Further, the new public industrial sector that was established, by and large, chose to import the technical knowledge required for production and thus there was a link with multinational companies abroad, but not a satisfactory link between research institutions such as those of the CSIR labs and Indian industries in contrast to the experience of Mysore under Visvesvaraya and his successors, like Mirza Ismail. It must be noted though that the Nehru effort was on a far larger scale, and there is need for caution in comparison.

Yet the strategies suggested for Mysore by Visvesvaraya faced much opposition. There was the issue of what today would be called a resource crunch, and the ambitious plans were greatly delayed. Many felt that the state should not be promoting industry. It was only with the rise of Mirza Ismail that some of Visvesvaraya's ideas were revived and implemented. In contrast, Nehru faced little or no opposition. The Congress represented national aspirations, every group in society stood to benefit from the proposed policies, and Nehru was able to move smoothly into the vacuum created by British withdrawal. It was a season of hope—problems appeared in the last years of Nehru's life, but the system came to crisis only after his death.

While there were many similarities in the ideas of these two stalwarts, there were differences as well. Visvesvaraya was a technocrat who apparently believed in a paternalistic system, and the western way of doing things, often in an imitative manner, and also in a society where various groups functioned in harmony. Nehru, on the other hand, was a liberal democrat who was more conscious of class differences. Yet his concern was moral and emotional. His idea of socialism did not amount to much more than state control of what he called the mixed economy. For Visvesvaraya, the cure for unemployment was rural industrialisation. Nehru had a much larger vision which he sought to operationalise through the community development programme. To Visvesvaraya, economic development was like a ladder that other countries had climbed faster, and his plans were meant to speed up India's rate of ascent following their policies. Nehru, on the other hand, had a wider international and historical perspective, and his foreign policy—e g, non-alignment—was meant to increase the space for manoeuvre of third world countries like India. Visvesvaraya was the austere and disciplined intellectual; Nehru

was an intellectual with a flair for communication and a political instinct. Thus Nehru appreciated the efforts made in Mysore state; he made full use of the industrial expertise built up. It was from the Mysore factories that some of the engineers and managers for the public sector units of the 1950s came; and it was to Mysore state and Visvesvaraya's home town, Bangalore, that the most sophisticated factories of the First and Second Plans were allotted, e g, ITI, HMT, BEL. Nehru left his own unique stamp through his implementation of the same strategy.

While both Visvesvaraya and Nehru shared a vision of a strong and united India, Nehru appears to have placed greater emphasis on the role of the union and its initiatives. Visvesvaraya argued for a national perspective and for co-ordination, but appeared to visualise a much greater role for what he called the provinces. He saw co-ordination emerging from discussions and co-operation among them in the spirit of Article 263 and the Inter-State Council, which Nehru never constituted. A hint of the difference is available in Visvesvaraya's comment that subordinating the Bank of Mysore to the State Bank of India was not desirable and not good for Mysore.

Finally, a link is being forged between the industries set up by Visvesvaraya and Nehru. Bharat Heavy Electricals came to Bangalore by taking over Mysore Porcelains and REMCO. Today, the state government is anxious to have the Steel Authority of India take over the VISL, and Bangalore has become the electronics city of India, and the headquarters of the space programme. Given the importance Visvesvaraya gave to defence, he would have welcomed this development.

IV

Now, at the end of the 1980s, the economic situation is very different from what either Visvesvaraya or Nehru must have visualised. The Nehru faith in socialism—state control from the commanding heights of the economy—is even being seen as a cause for inefficiency. Recent policies of liberalisation can be interpreted as a jettisoning of the Nehru concept of planning. Today the private sector is stronger, and it can be that it now wishes to take the initiative in industrial policy. But the capitalism that is developing, based on an aggressive assertion of class interests, would probably have surprised Visvesvaraya and disappointed Nehru.

As visionaries and planners, Visvesvaraya and Nehru both represented the needs of Indian industrialists. By the time of Nehru and independence there was a greater clarity and consensus in these ideas, and a better appreciation of politics in the sense of what was possible. There was a clear continuity in thinking in India on strategies for economic development as both spoke for the same class. They articulated their case and were instrumental in getting the state to implement policies that would achieve their objectives, especially after independence. In the process, India has developed an industrial capability, and a stable economy that is unique among third world nations. That is the achievement, and it has set the base for the challenges of tomorrow.

Appendix

M Visvesvaraya gave a talk on "Economic Planning" to the members of the Bombay legislature of which B G Kher was prime minister in 1936. He elaborated on the talk and published a pamphlet on "Nation Building" in 1936. Section IX of this pamphlet is reproduced below:

Summary of Recommendations

Of the proposals outlined in the preceding six sections of this paper, the following half a dozen items are fundamental for rapid economic advance. Details pertaining to these particular heads would have to be compiled and included, along with others, in the schedules and estimates of the five-year plan:

(1) Establishment of heavy industries, specially those relating to the manufacture of machinery and heavy chemicals;
(2) Extensive spread of cottage and small-scale industries and industrial life in rural areas;
(3) Providing banking and credit facilities and adequate tariff protection for both heavy and cottage industries;
(4) Establishing real self-government in villages;
(5) Introducing a district development scheme as outlined; and
(6) Universal mass education.

The following is a summary of the principal conclusions and recommendations:

(i) Economic planning is a means to an end. The end is a rise in material prosperity and standard of living.
A plan for a province will be part of the larger plan for India as a whole. A ten-year plan is suggested for Federal India and a five-year plan for a province.

(ii) Economic planning is part of a larger development, namely, "Planning for Reconstruction and Nation Building".
With the change in political status in the provinces, reconstruction on a planned basis in all three spheres—political, economic and social—becomes a necessity and this will be tantamount to nation building.

(iii) The organisation best calculated to promote the proposed developments will include (1) a five-year plan, (2) a development department, (3) a provincial economic council, and (4) a separate Development Budget.
It is not considered safe for any countr[y] to regulate its economic affairs in thes[e] days without a coherently designed polic[y] and a deliberate plan. Until a federal pla[n] is evolved and introduced, each provinc[e] should provide itself with a separate five-year plan of its own and the co-ordinatio[n] of provincial plans may be secured, as fa[r] as possible, by organising periodical conferences between the official representatives of the several provinces.
The development work under the pla[n] should be kept separate from the ordinar[y] administrative routine of the provinces. S[o] also, the development budget should b[e] kept distinct from the regular civil budge[t] of the province.

(iv) The five-year plan should give a schedule showing the growth or increase expected in the five-year interval, in income, production, trade, banking, and other occupations and activities within the province as previously indicated.

(v) The main result expected from these improvemen[ts] is a rise in the standard of living. In the present case, a rise of 50 per cent may be expected in ten years. It would, of course, be more if the central government were also autonomous. This large increase in production, income, etc, will be possible only in the early stages of the plan. As the resources become used up, the increase will necessarily be at a progressively diminishing rate.

(vi) In order that cottage and small-scale industries may be successfully established, local self-government in villages must become a reality. There should be no hesitation to grant self-government to village populations to the same extent that Japan has done. Rightly directed, the concession would help to stimulate creative power, aspiration and ambition in our rural communities.
To raise the standard of living of the masses, the District Development Scheme outlined will be found very efficacious and it should therefore be speedily brought into operation. This may be done without appreciably interfering with the existing administrative machinery.

(vii) Nation building will be a slow process at first but it is bound to grow as the country gets fuller control of money power, manufacturing power and the power of defence. The banks are the mainstay for all growth.

(viii) A beginning in planning may be made in each province at once by the establishment of a development department under the supervision of a minister with a competent secretary and a staff of three or more experts. An economic council of local men of experience and influence, financiers, economists and experts should be associated with the department.

(ix) The development department should be able to start surveys and investigations and prepare a provisional five-year plan as well as a plan for action in the first year. The preparation of these two plans by the department with the aid of the economic council, or a special committee appointed for the purpose should not take more than

three or four months at the outside.

(x) The resources of each province in men, material and equipment should be fully mobilised to serve these ends. The services of university and college professors, retired officials, economists, financiers, engineers, chemists and other experts, wherever available in the country, should be freely utilised by forming commissions, committees, informal brain trusts and the like. The population in every part of the country should be put to work and induced by suitable propaganda to respond cheerfully to the call made on them to raise their income and standard of living.

(xi) The huge waste of effort that is going on will be prevented if the government also awakens the general public to the fact that in present-day economy, agriculture, though a necessary occupation, plays a less important part than industries. In advanced England, agriculture, though protected and subsidised, is regarded as on the whole unprofitable.

(xii) This is machine age. It is power machinery that moves heavy railway trains, immense sailing ships, military and naval armaments, automobiles, aeroplanes, mills, pumping engines and a host of other instruments of mechanical production and propulsion. The condition of the country will remain low and primitive until deficiencies in equipment and use of machinery are made good.

Notes

[I am grateful to G V K Rao for his encouragement and to V K R V Rao, V M Rao, M V Nadkarni, Amal Ray and Vijay Padaki for their comments on an earlier draft. Responsibility for errors and opinions is my own.]

REVIEW OF POLITICAL ECONOMY

'Socialisation' of Critical Thought

Responses to Illiteracy among the Adivasis in Thane District

Denzil Saldanha

The non-party political groups in Thane district—by mobilising around adivasi cultural identity on economic issues related to their subsistence agriculture and through critical awareness, organisation and political action for social transformation—attempt to link the political with the cultural and economic. They thus offer a perspective for resolving the contradictions, between and at these levels, faced by formalised adivasi education. Above all, they create a climate of critical social awareness and political action which generates a felt-need for literacy-numeracy and functionality, in a more relevant formalised educational programme.

> Creating a new culture does not only mean one's own individual 'original' discoveries. It also, and most particularly, means the diffusion in a critical form of truths already discovered, their 'socialisation' as it were, and even making them the basis of vital action, an element of co-ordination and intellectual and moral order.
>
> [Antonio Gramsci, *Prison Notebooks* (1971: 325)].[1]

THIS paper attempts to focus on some of the efforts of non-party political groups in Thane district in the field of education. Their attempts at evolving an educational programme in the context of a democratic struggle and in tune with the felt-needs of the adivasis, are discussed within the wider scenario of adivasi illiteracy in the region and the relatively unsuccessful efforts of the state and voluntary social welfare agencies[2] to change the situation. One might visualise two possible factors leading to a change in the status of adivasi illiteracy in the future. On the one hand, the state sponsored developmental process—of dams and irrigation projects along the eastern belt of the district, and the setting up of industrial estates along the western railway line and highway—could lead to intensive multicropping, capitalist cultivation in agriculture and an industrial and urban spread along the coast. This could possibly result in a demand for formal education spurred on by a change in the economy, with the adivasis being integrated into the lower ranks of an unequal society, as clerical staff and wage labourers in agriculture and industry. On the other hand, the political assertion of economic rights and the accompanying process of the socialisation of critical thought among the adivasis promises to create a social basis for the need for literacy. The political groups working in the region are part of the latter process which ideologically hopes to influence the trajectory of development in the region and to direct the social history of the adivasis within a more egalitarian society. This paper shares that hope, and is as contingent and tentative as that process.

A brief social history[3] of the region would be in order and help towards the understanding of the socio-economic basis of present adivasi illiteracy. Thane district lies north of the Bombay metropolis and south of the Gujarat state. The region came under British rule in 1818. During the first half of the 19th century, the British land and forest policies resulted in converting the hunting, food gathering and shift cultivating adivasis into settled agriculturists. Throughout the 19th century and especially during the latter half, there was an influx of traders, moneylenders and liquor vendors resulting in the alienation of adivasi lands and their becoming tenants and bonded labourers; victims of forced exactions, indebtedness, torture and sexual oppression. Symington, a British official with a particularly keen insight into the problems of the adivasis in Thane, while writing in 1939 cited another official statement by Orr made in 1895 and in the process underlined a basic relationship between education and the economy of the adivasis which is valid even today. These officials expressed their concern at the impact of the British land and forest policies on the adivasis and their scepticism about education, in isolation, as a solution.

> We are sometimes told that in the triumphant march of education these backward tribes will some day learn to protect themselves against the people who are now robbing them of their lands. But long before 'education in its triumphant march' has got anywhere within reach of the Warlis, every inch of their land will have passed to their masters, and they will have no land on which to illustrate the advantages of education. Besides, it is their very poverty, resulting from the enormous share of the produce of the soil that they must give to their masters, that bars the advance of education; they must be constantly in search of their daily bread so that they cannot spare time for education.

And Symington himself added in 1939:

> Mr Orr's prognostication regarding the march of education has been only too unhappily fulfilled; but nothing as yet has been done to stay the process of the land passing out of the ownership of the old inhabitants or to save them from oppression even as tenants.[4]

A militant phase of adivasi struggle began with the entry of the Kisan Sabha in 1944 and continued till 1948. The dialectics between peasant organisations in the region and the post independence, state initiated land reforms and development measures have resulted in a predominantly poor peasant and agricultural labour, subsistence economy in single crop, rain fed agriculture for the present day adivasis. They are dependent on the state and a class of landlords, capitalist farmers, traders and creditors for employment, inputs into agriculture and for credit for tiding over the lean months. Alienation of adivasi lands continues, with increasing deforestation and restrictions on the use of the forests. The adivasis numbering 729, 424 formed 21.76 per cent of the total population of the district which was 3,351,562 according to the 1981 Census. Over a period of a little over a 150 years, today's adivasis have been hustled through several modes of production to suit the hegemonic interests of the larger economy—from hunting and shifting cultivation to settled agriculture and then to tenancy and bonded labour; and finally, in the present, to indebted poor peasants and agricultural labourers. This social history was surely not the appropriate basis for the demand for literacy to arise.

The comments of Symington made in 1939 are still valid today, with the difference that from tenants and bonded labourers the adivasis have been converted to indebted poor peasants and agricultural labourers. Illiteracy is an expression of the subordinate status of the adivasis within this trajectory of development. And yet, literacy is undoubtedly an important factor in a process of change in this position of the adivasis. In a subsequent section, one suggests that the efforts of the political groups in the region are a possible solution to this contradiction.

Scenario of Adivasi Illiteracy

Table 1 presents a picture of the position of literacy among the adivasis as compared to that in the totall population in Thane district according to the 1981 Census. It also indicates the availability of educational facilities in the villages. While the literacy rate in the total population in the district is 50.50 per cent, higher than that of the state (47.18 per cent); the adivasi literacy is only 14.4 per cent, even lower than that for adivasis in the state (22.29 per cent). Whereas the former may be explained by the relatively better performance of female literacy within that for the general popula-

tion in the district, the latter represents a dismal picture of both male (22.34 per cent) and female (6.29 per cent) literacy among the adivasis in the district. The talukas of Palghar, Dahanu, Talasari, Jawhar, Mokhada, Wada, Shahpur and Murbad which extend into the interior forested and hilly belt of the district and have a greater proportion of adivasis, display poorer levels of adivasi literacy than the talukas of Thane, Vasai, Kalyan and Ulhasnagar which are more urbanised and have a predominantly non-adivasi population. Rural-urban differentials in literacy rates vary sharply and the concentrations of adivasi population in rural areas reinforces this difference. Against a literacy rate of 38.58 per cent in the total population in rural Thane, the same stands at 65.46 per cent in urban. Female literacy among the adivasis follows the above rural-urban pattern, being extremely low in general (6.29 per cent) and comparing unfavourably with that of the males (22.34 per cent)

There has been a remarkable increase in the rate of literacy for the total population in the district. The progress has been tenfold from 1901 (5.31 per cent) to 1981 (50.50 per cent); with a doubling of the rate since around the time of independence in 1951 (24.34 per cent) and a near tripling of the rate of female literacy from 14.19 per cent to 40.15 per cent, for the same period. This has been primarily due to the urbanisation and industrialisation of the district with an influx of non-adivasi population. In fact, the proportion of adivasis decreased from 30.29 per cent in 1961 to 21.76 per cent in 1981. Another important factor responsible for the general progress in literacy has been the increase in the number of educational institutions. The number of primary schools increased from 1775 in 1960-61 to 2562 in 1980-81 and the secondary schools from 83 to 261 for the same period.[5] Table 1 indicates that by 1981, 95 per cent of the villages in the district had at least one educational institution. At present there are 183 balwadis, 76 ashram schools and 830 adult education centres in the district and they have the adivasis as a special focus of attention.[6]

However, the slow progress of literacy among the adivasis stands in sharp contrast to that in the general population and is despite state efforts in education. Table 2 gives a sharper picture of the comparative rates of literacy for the general population excluding scheduled castes and tribes and for the latter, for the years 1961, 1971 and 1981, for which some comparable data are available from the census. The literacy rate for the general population excluding scheduled castes and tribes shows a marked increase over a higher range from 42.32 per cent in 1961 to 61.09 per cent in 1981. The scheduled tribes, in contrast, are able to build on an extremely low base of 4.67 per cent in 1961 to achieve a rate of 14.41 per cent in 1981. The poor rate of female literacy among the tribes is all the more apparent when one compares it with that of the scheduled castes and the former category, especially for the period 1961-71. The scheduled castes have a low proportion to the total population of the district and are mainly found in the urbanised talukas.

It seems clear that this relative stagnation in adivasi literacy is not for lack of an infrastructure of educational institutions. In fact, Table 1 reveals that the very talukas of high adivasi concentration are the ones that are relatively better off as far as the availability of educational institutions is concerned. The adivasi pattern of living in scattered hamlets within a demarcated village and the consequent distance from the

village school might partly explain difficulties in access. But this in no way explains the evident adivasi 'resistance' to education and the persistence of illiteracy despite state efforts by way of an infrastructure of schools and teachers. The number of teachers in the rural areas of Thane district which stood at 8,815 in 1981 and gave a ratio of teachers per 1,000 of rural population of 4.73 does not compare unfavourably with the ratio for the state which was 4.90.[7] The symptoms of adivasi non-enrolment and drop out from educational institutions, cumulatively manifested in illiteracy, might be more meaningfully explained by: (1) the continuing subordination of the adivasis within a subsistence economy and their inability to withdraw labour power—even though it be that of the children—from the production process and invest it in education, (2) by their uncertainty that even if a differed economic gratification were made through present investment in education this would eventually bear fruit in a context of constrained employment opportunities and, finally (3) by the way in which education is conducted, i e, the content, context and mode of transmission of knowledge within educational institutions and its conflicts with the adivasi way of life.

Data collected in 1980[8] on two primary schools run by the zilla parishad in a village in Talasari taluka provide a micro-view of some of the immediate factors that might still be contributing to the poor educational level among the adivasis at the district level. Both the schools taught till the 4th standard, the one in Patil Pada starting in 1953 and that in Wadi Pada being established earlier in 1949. Of the 70 children registered in the two single teacher schools in 1980, only 3 were girls. Table 3 gives a distribution of the students in the schools over the 4 classes and for the period 1970 to 1980. The teacher reported that only 25 per cent of the children of the appropriate age group were registered. 45 of the 70 children attended regularly. Poor economic conditions, the need for child labour and the lack of a tradition of education were some of the reasons for poor attendance, given by teachers and parents. While books, pencils, slates and a set of clothes were supposed to be given free of charge by the zilla parishad to the adivasi school-going children, only 5 and 10 out of the 34 in the Patil Pada school benefited from slates and clothes, respectively. Girls generally studied till the 2nd standard and dropped out, their education being considered as a burden in depressed economic conditions and anyway of not much use later. The data from the table indicate that as a general trend only about 25 per cent of the children who entered the 1st standard, were to be found in the 4th standard. Only 37 children from the village schools passed the 4th standard, over the ten year period. Opportunities for study beyond the 4th standard were, at the time, by way of an ashram shala which taught till the 7th standard, in a nearby village. 15 students from this village were reported to be making use of the facility. Eight children in the village were reported to have passed the 7th standard, over the past years and another five the high school. Two of the latter were attending college. According to the 1981 Census, the male literacy was 21.12 per cent, the female literacy 1.02 per cent and that of the total population 9.85 per cent, in this adivasi village.

P Prabhu and V Suresh,[9] based on their close contact with the field, describe the poor state of government sponsored formal education of the adivasis in the region.

> By their (educational authorities) own admission, less than 15 per cent of the state sponsored schools function. Most schools exist only on paper. Children are enrolled, taught, examined and promoted in the records alone. Less than 10 per cent of school going children enrol in school. Of these less than 10 per cent finish higher school. In a population that is 90 per cent illiterate, schooling is not at a premium. Sending a child to school means sacrificing a working hand. Sustained schooling is possible only in the better off families. As for the 60 per cent of the families who migrate for work, schooling is impossible. Schools have failed because the tribals does not demand education as a right. The curriculum has no relationship with his life at all. The motivation of teachers is low, even those who are tribals from the area. The reason why education has failed as a development strategy is because the tribals never wanted it in the first place. The rich families took to it because it promised a job.
>
> When only one per cent of the children in the school going age finally complete schooling, education cannot even be considered a mixed blessing. One could call it a disaster.

The reason given for this pessimistic assessment of the condition of the few educated adivasis is the alienation and the schizophrenic existence that awaited them in urban contexts for which they were so inadequately prepared.

The dismal scenario of adivasi education in the district prevails despite the efforts of several voluntary social welfare organisations. The western talukas of the district have, in particular, been well served by the zeal of these organisations which has been motivated by a mix of humanitarian concern, religious and political ideologies and innovative educational philosophies. A few examples may be mentioned: Pragati Pratisthan (Jawhar taluka); Balkanji Bari (Bapgaon, Dahanu taluka); Vishva Hindu Parishad (Talasari taluka); Maharashtra Gopalan Samitee (Sutrakar, Talasari taluka); the institutional complex of Grammangal (Dabhon, Dahanu taluka), and Gram Bal Shikshan Kendra (Kosbad, Dahanu taluka), moved by the inspiration of Tarabai Modak and Anutai Wagh; the educational network of the Gokhale Education Society's Agricultural Institute (Kosbad, Dahanu taluka); the Catholic Church, Jesuit mission inspired, Gnanmata Sadan (Talasari taluka) with 11 elementary schools and 1 high school; M D Society (Vadoli, Talasari taluka); Samajvadi Mahila Sabha, (Masvan, Palghar taluka). The ideological and educational orientations of these institutions with their social imapct within the contending hegemonic processes in the region, could be a subject of a study by itself. What is clear is that they have not made any major impact on adivasi illiteracy. We might now turn to the activities of some political groups which offer a contrast to the foregoing institutionalised educational programmes of the state and of voluntary agencies with a welfare orientation.

Source: *Census of India*, Maharashtra, for various years.

I have chosen three organisational formations: Vana Niketan—Shramik Mukti Sanghatana, Vidhayak Sansad—Shramjivi Sanghatana and Kashtakari Sanghatana, because in their history over the last 10 years or so, they illustrate movements over overlapping strategic options that are available to voluntary groups. The first two initiated their acitivities with a developmental and perhaps even a welfarist orientation and then shifted emphasis towards political action for an alternate process of development. The third appears to have launched itself quickly onto the plane of political action. All three viewed education as part of concerted action for social transformation.

The Vana Niketan was established as a rural development project in Murbad taluka, Thane district, in 1981 by four professional social workers. This was a follow up to the field placement of students from the College of Social Work, University of Bombay, in 1979-80. The first few years were spent on surveys relating to education, encroachments on forest lands and practitioners of herbal medicine. Cultural festivals for the adivasis, exhibitions and adult education centres were some of the activities during the early phase. In 1985 a people's organisation, Shramik Mukti Sanghatana, with a collective agitational thrust was formed and in early 1986 the Vana Niketan discontinued its relation as a demonstration project of the College of Social Work, but continued as a newly registered development organisation.

The organisation has presently spread its influence from Murbad taluka over the neighbouring Kalyan and Shahpur talukas and works among the Thakur, Katkari and Mahadev Koli adivasis, in that order of importance. It works in 90 hamlets spread out over 40 villages through Shramik Mandals or village committees. Four adivasi full time activists, apart from five adivasis who work part time and three middle class activists, devote their energies to the organisation. Much emphasis is placed on popular initiative through collective decision making, where the process of forging a "strong peoples movement with enlightened local leadership" is considered more important than the outcome of that process in immediate economic gains. The organisation is active on issues relating to land, rights to the forest, enforcement of the minimum wage, the employment guarantee scheme, the freeing of bonded labour, drinking water facilities in adivasi villages health and culture. Apart from the social awareness generated on these issues through village meetings and demonstrations, education is carried on in a more structured manner through 10 non-formal educational centres and five balwadis , in co-operation with the Gandhi Trusteeship Foundation, Bombay. Fifteen training camps for adivasi youth and eight for women in particular, have been conducted. Science awareness marches have been organised with the assistance of the People's Science Movement, Bombay. The focus of these marches is on ending superstitious practices, on environmental education and on fostering a scientific outlook.[10]

A recent joint initiative of the Shramik Mukti Sanghatana and the People's Science Movement has resulted in preliminary work towards setting up a 'school'—Jeevan Shikshan Shala—for non-school going adivasi children, 12 to 13 years of age. By this age most children are forced by circumstances to become regular agricultural labourers in the region. The aim of the 'school' is "to give opportunities to the children who have been deprived of education, to prepare them to face a life full of struggles at all levels and to take decisions of their own to solve the problems of the community".[11] The work will initially concentrate on Murbad taluka and hopes to spread to the district with the assistance of other mass organisations. The total duration of schooling will be 30 days, split up over four units of six days each, held in different hamlets, followed by three follow-up camps of two days each. Twenty boys and twenty girls have been selected for training during a workshop for children held from May 9-16, 1988, when about 60 children had turned up. The topics selected for the 'school' are: Literacy and numeracy that will provide basic reading ability and the arithmetics of adivasi monetary transactions, measurements of length, area and time and map reading;

The anatomy of humans and animals leading to an understanding of health, illness and medicine, man's relation with the environment and the issues of health and deforestation ensuing from a break in these relations;

The social history of the adivasis, their cultural traditions, man the producer, forest and agricultural practices and government schemes for the adivasis.

The themes, as may be observed, cover the broad framework of literacy numeracy, basic functionality and social awareness, and in a manner that would be relevant to an adivasi context. Fortnightly meetings and field visits for the volunteers of the People's Science Movement are being held from July 17, 1988 as a preparation for the non-formal 'school' that will be held in four sessions, from December 1988 to May 1989.

The Vidhayak Sansad is a registered trust started in 1979 with the aim of rural development with social justice. Starting as a health centre based in Dahisar village and serving 12 villages in Vasai taluka in Thane district, the organisation has spread its activities to the Bhivandi and Wada talukas, in addition to Vasai. Its work is among the Warli,

Mahadev Koli and Katkari adivasis, in that order of importance. Apart from the health centre, a creche for the children of working women, balwadis, libraries for children and adults; income generating schemes like basket making and goat rearing were some features of the first phase of the programmes.

This social welfarist approach with individualised assistance to beneficiaries was soon confronted with the socio-economic context of the lives of the adivasis. The major problem was at the level of the social relations of production—the question of bonded labour and indebtedness among the adivasis. A sister organisation, Shramjivi Sanghatana, was registered as a trade union in 1982 and addressed itself to the problems of agricultural labourers and marginal farmers. 496 adivasis have been so far released from debt bondage through a mix of agitations, writ petitions, appeals through the media and the legislature and supportive measures for the released adivasis. The thrust of intervention gradually shifted from an individualised welfarist approach to a developmental approach which, while attempting to provide inputs to raise the forces of production, confronted the exploitative social relations through collective self-assertion. The data on the organisation suggest that accompanying this conflictual process, co-operative forms of alternatives to individualised agricultural subsistence were attempted by way of co-operative production units for brick making and horticulture, grain-banks to tide over the lean months and social reform measures like group marriages and drives against alcoholism to counteract indebtedness. To encourage local participation and leadership, 102 village committees have been set up and training camps have been initiated. The organisation has, at present six full time adivasi activists and four non-adviasi ones from the urban middle class.[12]

How does the foregoing relate to education? I think it is through the generalised critical social awareness that is generated through the process of struggle for collective development and the specialised study camps for adivasi leadership. These camps were organised in the months of September, October and November from 1985 onwards for three days each month. 122 adivasi activists have been trained, the vast majority of whom are illiterate and without any formal education. A participatory approach based on a collective critical review of social experiences was a characteristic of these camps. It had the advantage of generating solidarity in the process of a search for solutions and directions. By moving from the concrete to the abstract in a collective process of critical thought, the camps attempted to, and, from all indications, succeeded in bridging the gap between the individual and the collective, between thought and action in the process of transforming the actual situation. The broad topics covered, and in an order of abstraction and generalisation, were questions related to land, issues in dealing with the police and the courts, the government's development schemes, and local geographical knowledge. The local self-governing bodies such as the gram panchayat, panchayat samity and zilla parishad and the mechanisms of exploitation were a second set of subjects of greater complexity. The sessions would end with an introduction to scientific observation through dissection of animals and the use of the telescope and microscope. Selected activists trained in one programme served as trainers in succeeding camps. The trainees were given action oriented tasks to be performed at the police station, gram panchayat office, the revenue office and the village school.[13] The trainees who emerged from the camps were centres of a ripple effect which spread at the village level to varying degrees through informal discussions and meetings with the village committees.

There is no direct emphasis on literacy at the camps, except for the capacity to sign one's name. The walls of the huts around the training camp are covered with symbols, models, graphs, slogans and pictorial illustrations. The adivasi trainees, the vast majority of whom are illiterate, are given a pencil and notebook and encouraged to fill it up. This provides an initiation into the symbolic systems implicit in literacy and numeracy. Group songs, games, group report writing, role plays and dramatisation are other modes of instruction that are used in a context of illiteracy and a consequent limited capacity for abstraction. The non-adivasi activists of the Shramjivi Sanghatana believe that critical awareness creates the social basis for a felt need for literacy. That basis exists at the moment and the next step would be to move on to literacy. The trainees have already experienced the need for literacy and seek it out through literate members of their village community. As one literate activist put it: "If social awareness is lacking, consistency in attending a literacy programme becomes difficult for the adivasi. If we organise the literacy classes now (i e, after the social awareness training) we will get a tremendous response."

Education understood in its most meaningful sense, as the generation of a critical social awareness, is intimately interwoven with the activities of the Kashtakari Sanghatana. The organisation sums up its activities in "five basic concepts: Janashikshan, janajagruti, janakarya, janasanghatana, janashakti—people's education, generating people's awareness, expressing itself in peoples action, leading to people's organisation and finally culminating in people's power".[14] The salutation of the raised, closed fist came to symbolise and reinforce these five principles. The organisation was initiated in a context and, to a large extent, as a result of 'people's education'. It continued for the first few years, after its founding in 1978, with an intensive educational programme linked to action. Repression from the state, the dominant landlord-trader-moneylender class in the region and from an unexpected quarter, a competing and earlier mass organisation in the region—the Kisan Sabha (CPI-M), forced it to cut down on many of its activities and to take a defensive stance after 1982, especially in Talasari taluka. Innumerable court cases have also contributed to draining the energies and the meagre finances of the cadres, deviating their attention from more urgent tasks. Its influence is presently to be found in the Dahanu, Jawahar and Mokhada talukas and predominantly among the Warli adivasis.

During the initial years, weekly meetings used to be held in the villages with the adivasi men and women. The discussions would be in the form of a collective analysis of the context and causes of poverty, an understanding of self-worth and the need to take individual and collective responsibility for changing one's conditions. Two-day camps, youth festivals of a longer duration, special camps for women and meetings with other activists/organisations, such as the Bhoomi Sena in Palghar taluka and the Shramik Sanghatana in Shahada taluka, Dhulia district, were some of the activities during the early phase. The organisation visualised adult literacy, health camps and agricultural training camps as building on this social basis of critical awareness, responsibility and action. It explains its educational philosophy thus:

> The fundamental objective of all this education has been to encourage the people to posit an act of freedom—the free process of education does not domesticate the mind and the will of the learner as happens in the course of formal education. We want our education to be the starting point of freedom. The awareness which takes place in the process of people's education, that takes place continually, is also understood in an act of affirmation, the act of affirmation of confidence in oneself. Hence the awareness begins with the discovery of each person as a dignified human person. In the festivals we call it the theory of self image. The image the people have of themselves is what determines their behaviour and so a people acting for freedom must begin to understand themselves as free human beings, people whom the bondage of poverty and deprivation, the marginalisation and dehumanisation will not crush. The awareness of the human person leads to the discovery of the dignity of the other person as well.[15]

Action resulting from understanding led to a second act of affirmation, that of a sense of identity with the Kashtakari Sanghatana. The organised or spontaneous actions of the people have been classified in the following manner:

(a) stop illegal moneylending;
(b) recover money illegally taken from the people by moneylenders, shopkeepers, merchants, etc;

(c) recovery of unpaid wages by grass merchants, forest contractors, labour contractors, etc;

(d) resistance and demand for stopping acts of beating, harassment by shopkeepers, merchants, etc; and

(e) resistance to high-handed behaviour of shopkeepers, supervisions of landlords, etc.[16]

Other types of issues/actions have been "to establish rights that are due to the people under the various development schemes of the government", to resist the extortions of government officials, especially those of the police, revenue and forest departments; the alienation of adivasi lands to the landlords and traders; to ensure work and wages under the Employment Guarantee Scheme (EGS) of 1977; issues related to the forest, i e, the regularisation of adivasi encroachments on the forests, commercial deforestation and social forestry; the formation of common platforms with other organisationss on issues relating to the EGS, state repression, on the women's question and on the regularisation of forest lands; the anti-drunkenness drive; and finally the attempt to establish alternate forms of co-operative activity through committees to settle internal disputes, through grain banks, mutual labour assistance, joint cultivation and group marriages. All these actions have been accompanied and followed by reflection in informal village groups, in meetings of village committees and in those of co-ordination committee of the organisation.

The methods of education are lectures, group discussons, case study, simulation exercises and role play. Skits, songs, recitation of stories and the use of symbols are cultural activities that are integrated into the educational programmes. The following is a vivid record of one of the simulation exercises that has been used to stimulate analysis of concrete everyday experience and action:

> A skinny, scantily dressed woman joins the group. She walks noiselessly and coveringly around the circle, clutching a lump of earth protectively. She stumbles once or twice, manages to regain balance. The third time she slips, she falls, the lump of earth from her hands goes crashing to the earth and crumbles. Frantically she tries to draw the fragments together but is unable to do so. In desperation she makes four piles: near one she places a bottle, near the next some money, beside the third she places a few grains of paddy and the fourth she retrieves and holds carefully to her bosom. She lies prostrate for sometime and then withdraws. The effect is electrifying. The participants watch in stunned silence, from somewhere in the circle, a stifled sob is heard. Slowly and painfully they begin to respond. One crushes the money beneath his heels, symbolic of driving the moneylender away, another kicks the bottle, doing away with drink, a third attempts to collect the mud, he is joined by another and yet another—symbolic of the collective attempt to regain the land. To Somwari and the others, the challenge dawns: take responsibility for your own life, unite to change the present, to ensure a better future. There is no indecision. Somwari becomes one with the Kashtakari Sanghatana.[17]

The organisation places heavy emphasis on collective participation in the process of planning, execution and reflection on actions, seeing it as a "process of peer group learning rather than a programme from the top". The non-adivasi activists in the organisation are aware of the problems of political education in a context of a culture of illiteracy reinforced by socio-economic exploitation, as may be seen from the following record:

> With the bulk of the members and a considerable proportion of the village cadre being illiterate, the theoretical formation of the cadre and the political education can take place only by word of mouth. Further the adivasi language being relativey simple with few if any conceptual terms, communication of concepts becomes difficult. The third factor being the simplicity of the people which necessitates the over-simplification of complex theoretical matters. The combination of the three making the process of political education tedious and slow. Every matter needs to be explained, nothing can be left for private reading and study.[18]

In August 1986, the organisation arrived at a political understanding with the Lal Nishan Party.[19] This has effectively given it some legitimacy in the eyes of the rival organisation, the Kisan Sabha (CPI-M), and has reduced the tension between the two. The Kashtakari Sanghatana has recently proposed to build on the basis of the political awareness gained in the process of struggle for the eco-political rights of the adivasis, through a more intensive focus on alternatives, especially in the areas of adivasi medicine, forestry and education.

As a step towards an alternate co-operative health programme, the organisation plans holding a training camp from March 25 to April 24. Two representatives from each of 10 village health collectives consisting of 20 families each would have an opportunity of interacting with practitioners of ayurveda, acupuncture and homoeopathy, so as to supplement their traditional skills in jungle medicine. This alternative which is considered "meaningful, based on peoples' resources and manageable by the people", hopes to incorporate the skills of the 'bhagat', the adivasi medicine man.[20]

The organisation also visualises a non-formal educational programme that would be close to the cultural and economic context of the everyday life of the adivasis. Fables that are part of the oral tradition among the adivasis and illustrate the conflicts faced by them, have been picturised by the adivasis in their local art form. These will be used as the medium and the basis of a literacy programme that will be articulated with the infromal teaching-learning situations and socialisation processes in the culture of the adivasis, and the confli[illegible] experienced at the level of the social relatio[illegible] of production. The following are samples [illegible] two fables which convey the popular unde[illegible]standing of how, through liquor and mone[illegible]lending, two communities of non-adiva[illegible] settlers in the region expropriated t[illegible] adivasis of their possessions and their ve[illegible] persons.

> A tribal managed to keep the messenge[illegible] of Jam (God of death) at bay. The forest w[illegible] his ally in the task. Jam angered at the disa[illegible]pearance of his messengers, was intrigued [illegible] to how it could have happened. But he w[illegible] at a loss as to how it happened. He decide[illegible] to come down to earth in the form of [illegible] Parsee. He set up a khomar (liquor distille[illegible] and shop) in a tribal village and offere[illegible] liquor to the tribals. News of his munificen[illegible] spread far and wide and there were willin[illegible] guests. The tribal together with his fathe[illegible]-in-law heard of the Parsee's bounty an[illegible] decided to visit the liquor shop. While the[illegible] sat and drank, the Parsee listened to the idl[illegible] chatter of his guests. From the boasts of th[illegible] drunk tribal, he learnt of the trick by whic[illegible] the messengers of Jam had been foole[illegible] and imprisoned in the forest. The Parse[illegible] challenged the drunk tribal to give proof o[illegible] his feat. In a stupor, the tribal led the Parse[illegible] to the forest and reveled the secret. Th[illegible] Parsee then shed his disguise, his messenger[illegible] rushed out and grabbed the spirit of the triba[illegible] and went back to their heavenly abode.
>
> The Marwari or Vani moneylender is portrayed as a bandicoot who meets a woman returning from the forest with a headload of firewood. He requests the woman to take out a thorn embeded in his tail. While taking the thorn out, the rat's tail breaks. As compensation, the rat takes away her sickle. He offers the sickle to a man splitting bamboo with his teeth. When the sickle breaks he takes away the baskets that the tribal man was weaving. He offered the basket to yet another tribal farmer who was carrying the grain from the threshing floor in a leaf. When the basket breaks after use, he takes away the drinking water pot. The pot is offered to another set of farmers who lack the means to carry water to their fields. On breaking the pot, the rat takes away the produce of the fields which he offers to yet another family who are starving. The food is consumed, and the rat takes their cattle in exchange. He comes across yet another tribal who is forced to use his wife as a beast of burden to pull the plough. He offers a bull. When the bull finally dies, the rat walks away with the tribal's wife.[21]

It is hoped that a literacy programme based on popular 'common sense' and linked to the ongoing struggle for exercising political control, will be an added weapon in the process of social transformation.

CONCLUSION

The theoretical argument which emerges from the foregoing data gathered from field visits, interviews, observations and secondary sources, may be briefly stated as follows:

The vast majority of the adivasis in Thane

strict, as a result of a historical process f economic domination by landlords, aders, forest contractors and creditors, find emselves today as indebted agricultural bourers who are seasonal migrant workers grass cutting and in the industrial inforal sector; as poor peasants who are unable eke out a subsistence level of living from neir uneconomic holdings in single crop, ain-fed agriculture; and finally as labourers who are bound in various forms of contracual arrangements as a result of indebtedess. The inequitous relations at the conomic level are paralleled and reinforced y a process of cultural hegemony, of which ducation must be seen as a part. While this egemonic process fails to entice and llocate the vast majority of adivasis within trajectory of capitalist development of griculture and a structurally unequal ndustrial society, it results in a gradual lestruction of adivasi identity and a comnercialisation of adivasi culture. In culurally hegemonic and socio-economically polarised contexts, the process of transmision of knowledge in effect becomes an implantation and, thus, alienating. The few adivasis who are able to attain the certificaion levels of this alien educational system are allocated to lower-middle class positions n the government administration, in the social welfare programmes and in the educaional system itself.

Formal education undeniably provides a certain competence within this adviasi context, a major aspect of which would be an initiation into middle-class status and functioning especially for the few who are second generation learners in the formal system. The vast majority of adivasis look on the formal education system with awe, as a ritual that they can ill-afford because it is irrelevant to their immediate needs. The symptoms of this stance are the incidence of non-enrolment, stagnation and drop-out cumulatively manifested in illiteracy. Illiteracy, in this particular adivasi context, may be seen as a rational strategy for survival in the context of subsistence agriculture; a withdrawal from an alien system which in its context, content and mode of transmission of knowledge is considered unrelated to immediate eco-cultural demands; and as an act of resistance and preservation of cultural identity.

The majority take recourse to the more spontaneous, unstructured teaching-learning processes that are built into their everyday life socialisation and their strategies for survival within conditions below subsistence. These are, for instance, the transmission of agriculutral, food gathering and forestry skills within the domestic sphere, at the level of economic production; the gynaecological and child rearing skills transmitted thorugh the 'dai' at the level of biological and social reproduction; and at the level of cultural reproduction, the role of the 'bhagat' in giving a sense of ethnic identity to the people through rituals at various ceremonial occasions, enchantations related to the agricultural cycle and through his practice of herbal medicine. P Prabhu and V Suresh,[22] activists of the Kashtakari Sanghatana, observe that the socialisation of the adivasi children is free from enforced discipline and corporal punishment. Organic learning takes place in the company of older children and adults. At the age of 4-5 they function as 'balgyas' (child sitters), then become 'govari (cowherds) at the age of 8-9. The boys soon graduate to being 'nangrya' (ploughmen) and fishermen and the girls to mature female roles such as collection of fodder, firewood and manure, sowing, weeding, transplanting, harvesting and winnowing. Disputes and negotiations are settled publicly, thus providing a learning experience at a tender age. These informal teaching-learning situations involving the communication of knowledge are considered directly and immediately relevant.

There exists a range of educational efforts attempting to confront the problem of adivasi illiteracy in Thane district. There is no basic difference between the formal educational institutions of the state/local self-governing bodies and those of the voluntary social welfare institutions. A social welfare approach that visualises education as a rescue act, an exercise of patronage of individualised beneficiaries who are objects of a process of transmission of knowledge, is a common charcteristic of both these efforts. Among the latter institutionss, one might find a few noteworthy attempts to bridge the contradictions at the level of culture, by integrating elements of adivasi practice into the educational programme and to relate education to the economic needs of the adivasis by taking education to their doorsteps and imparting training in functional skills. Some of them are marked by their humanitarian concern for identifying and nursing a minority of adivasis through the educational system. Religious and political ideologies play an important part in these educational efforts from above, and the adivasi objects of patronage become show pieces and dependable clients entrusted with the task of winning over a wider circle of clientele from among the adivasis. However, both state and voluntary social welfarist efforts in education in the region have in common a near total neglect of the contradictions of the social relations of production which form the real context of adivasi agricultural subsistence. These contradictions find no reflection in the context, content and mode of transmission of knowledge in formal education. In fact, despite the humanitarian concern, the effective thrust is towards weaning away a minority from the process of resolving these contradictions. Voluntary effort in institutionalised education in the region may be seen, in effect, as a more efficient instrument than that of the state, for the social reproduction of the relations of production along the lines of the state sponsored strategy of development.

If the essential components of the Adult Education Programme—literacy-numeracy, functionality and social awareness—may be understood in a general, conceptual and symbolical manner, as the basic windows to fields of knowledge and hence as integrating principles of even the formal educational curriculum, then the educational efforts of state and welfare agencies may be seen as having a major focus on literacy-numeracy, with some degree of functional allocation within a differentiated and alien system, to the total neglect of action for social transformation based on critical social awareness and political assertion of identity. The foregoing analysis and what follows might suggest an implicit continuum within the educational process: (1) From the ritualisation of a symbolic system and its knowledge content involved in the transmission of 'literacy-numeracy', and a special area of focus of the state's social welfare approach to education; (2) to the communication of a 'technologically' relevant knowledge with the function of allocating to middle-class professions within an inequitably structured *status quo*, as may be found in a few innovative attempts in voluntary welfare agencies that combine literacy-numeracy with some degree of 'functionality'; (3) and finally, and in a manner suggesting a break in the continuum, the generation of awareness of the conflicting context of survival for the adivasis, its causes and alternatives as implicit in 'social awareness', and which forms the primary concern of the non-party political groups in the region. One might then see that the levels of voluntary mediation between state and society correspond to preferred educational/developmental thrusts.

In contrast to the social welfarist approach to education, one sees the educational efforts of the non-party political groups in the region focusing on 'social awareness'. The former is confronted with the dichotomy of, on the one hand, providing the adivasis a selective access to an 'elitist', 'good' education, geared to and emanating from industrial and urban contexts (an example is the Navodaya Vidyalaya approach), within the constraints of finance and the limited capacity of the economy to absorb this educational output; and on the other, in its search for relevance, offering a watered down education, 'appropriate' to the needs of adivasis in their present location within a sharply polarised rural and agrarian structure. The approach of the political groups offers a perspective for resolving some of these contradictions which are confronted by the more institutionalised, formal educational process at the cultural and economic levels of adivasis existence by linking education to the political act of social transformation along the lines of an alternate development strategy. They see their educational programmes as offering a critique and a possible corrective to the more formalised processes of transmission of knowledge. Some of these organisations—Vana Niketan/Shramik Mukti Sanghatana,

Vidhayak Sansad/Shramjivi Sanghatana have initiated their efforts on an economic developmental plane by attempting to provide training, technological and organisational inputs within the stagnant forces of production. This has been done in a participatory and collective manner. They soon moved to a political plane as they were confronted with the need to resolve, through agitational means, the contradictions of the social relations of production which enmeshed the lives of the adivasis. This demanded a change in organisational structure and linkages, with sister organisations being created. The Kashtakari Sanghatana appears to have started directly with a more political and agitational thrust, resulting in heightened repression. All these organisations laid heavy emphasis on the generation of a critical social awareness through group discussions in the adivasi villages and training camps for activists.

These processes are not self-consciously 'educational' in character in a 'formal' sense, but contain an inbuilt component of transmission of knowledge, technological skills and social awareness as part of a 'formalised' process of social transformation. They have visualised knowledge to be not only an instrument of harmonious control over the environment for greater economic returns, but also as a means to empowerment through critical awareness and participatory organisational forms. Social transformation is itself seen as an 'informal' process of education. The very relevance of these developmental processes and their immediacy to the needs of the adivasis renders them articultated with the life of the people, so that ironically they no longer may appear as 'educational'.

The non-party political groups—by mobilising around adivasi cultural identity on economic issues related to their subsistence agriculture and through critical awareness, organisation and political action for social transformation—attempt to link the political with the cultural and economic. They thus offer a perspective for resolving the contradictions, between and at these levels, faced by formalised adivasi education. Above all, they create a climate of critical social awareness and political action which generates a felt-need for literacy-numeracy and functionality, in a more relevant formalised educational programme. The major question is: Can an endogenous system of transmission of knowledge and competence be evolved which critically questions and mobilises to action in the very process of transmitting accumulated human reflection on the socio-economic context of people's relation with their environment? One sees the efforts of these political groups as a tentative answer to this question. These nonformal educational processes in adivasi regions suffer from an illegitimacy in comparison with the more formalised systems of education. They are, after all, attempting to set in motion an alternate hegemony whose future will be decided by a historical process. 'Science' can definitely lend its critical support to these 'commonsensical' approaches to the 'socialisation' of critical thought.

Notes

[I am grateful to S Parasuraman and K Ravindran for their assistance with the tables and S Sreenivasan for her comments on the paper. Needless to add, I alone bear responsibility for the errors that persist and the positions taken.

The original version of this paper was presented at the national symposium on "Education and Democracy", organised by the Nehru Memorial Museum and Library, New Delhi, October 10-12, 1988.]

1 The theoretical formulation underlying this paper has been inspired, in part, by a reading of A Gramsci, especially the *Selections from the Prison Notebooks*, edited and translated by Q Hoare and G N Smith, New York, International Publishers, 1971. The concepts of hegemony and of science in its relation to common sense are used in the Gramscian meaning of the terms, interpreted in the context of the field situation in Thane district. For a theoretical and methodological discussion of the use of these concepts, see D Saldanha, 'Antonio Gramsci and the Analysis of Class Consciousness: Some Methodological Considerations', *Economic and Political Weekly*, Vol 23, No 5, January 30, 1988.

2 I have drawn on the classification of voluntary agencies provided by Harsh Sethi, 'Groups in a New Politics of Transformation', *Economic and Political Weekly*, Vol 19, No 7, February 18, 1984, which is: (a) relief and charity organisations; (b) developmental groups; (c) groups engaged in mobilisation, organisation, politics and political education; and (d) protest groups and related activities. I have modified the classification to suit the region, as will be seen in the text. The classification (a) might be better termed as social welfare agencies and, in practice, seen as an extension of state functions. Category (b) developmental groups has been retained and (c) and (d) might be better understood as converging into non-party political groups. The classification is not static and exclusive, as has been pointed out by the author, with a tendency of movement from (b) to (c), in particular, and as seen in the organisations discussed in the text.

Culture and Subaltern Consciousness

An Aspect of MGR Phenomenon

M S S Pandian

This essay is about how dominant ideologies succeed in the terrain of struggle and produce consent among the subaltern classes. This process is illustrated by exploring the screen image of MGR and its insertion in the pre-existing common sense of the subaltern classes in Tamil Nadu.

I

SOCIAL scientists working within the broad Marxist framework have achieved substantial advances in understanding varied forms of protest movements, revolts and anti-establishment organisations in India. Two volumes on peasant struggles in India edited by A R Desai [1979, 1986] and six volumes of 'subaltern studies' edited by Ranajit Guha [1982, 1983, 1984, 1985, 1987 and 1989] would bear ample testimony to this achievement.

To study protest movements and revolts is to enquire into the counter-hegemonic projects of the subaltern classes. While it is no doubt important to study these counter-hegemonic projects and draw lessons from them, it is equally important to recognise that such projects are few and far between in time and space. In other words, the dominant reality has been one of the subaltern classes accepting the hegemony of the elite through such processes like deference to the elites and emulation of elite values.

However, there is hardly any study on how the ruling elites produce[1] consent from the subaltern classes in concrete situations. This lack in the current scholarship has already been pointed out by some scholars [Sarkar: 1984; Patnaik: 1988]. The present essay takes this as a point of departure and makes a modest attempt to explore into subaltern consciousness while under hegemony, through a case study of the immense popularity enjoyed by the late M G Ramachandran (MGR hereafter) among the people of Tamil Nadu.[2]

There are specific reasons for choosing the MGR phenomenon as a concrete instance to analyse the problem. The eleven-year rule of MGR did not cause any particular structural changes in the economy to benefit the subaltern classes in Tamil Nadu. Their material conditions indeed worsened during this period [MIDS, 1988]. On the other hand, his government ruthlessly used the state machinery to put down even the mildest of protests from workers, peasants, fisher people, teachers, government employees, etc. Also, his rule diluted unrecognisably the cultural gains achieved by the subaltern classes due to the drawn-out struggles of the Dravidian movement during its early progressive phase. Given this, one would expect that the subaltern classes would have resented MGR's politics. On the contrary MGR enjoyed a stable, if not growing, popularity among the poor in Tamil Nadu throughout his tenure in office. His party polled a third of the total votes in every election, and his followers exhibited an almost personal bond with him throughout. When he died on December 24, 1987, several lakhs of people converged in the city of Madras and his funeral witnessed an unprecedented spectacle of grief. Besides, thirty-one of his followers committed suicide.[3] Thus the 'ascribed' consciousness and the 'actual' consciousness of the subaltern classes are substantially divorced in Tamil Nadu.[4] For this reason, an exploration into the MGR phenomenon would further our understanding of how the elite produce consent among the subaltern classes.

Moreover, there exist only a few studies on the MGR phenomenon [Hardgrave Jr, 1979; Samuel, 1983; Thandavan, 1983; Sivathamby, 1981]. All these studies, except Sivathamby's, are empiricist, sometimes adulatory, and do not raise questions concerning the subaltern consciousness *vis-a-vis* the MGR phenomenon. (This is a secondary reason for taking up the MGR phenomenon for the study.) However, I must hasten to add that the essay is not going to explore all aspects of the MGR phenomenon. The phenomenon being multi-layered and complex, we would take up only one of its aspects for analysis: How a specific image of MGR was presented on the screen, where in the cultural mosaic of the subaltern classes this image is rooted, how and why this image became popular and what is the nature of its ideological content.

II

Before we embark on a discussion of the phenomenon itself, it is important to spell out a few things about the central analytical category employed in the essay, i e, the category of common sense of "the philosophy of the non-philosophers" developed and elaborated by the Italian Marxist Antonio Gramsci. Gramsci developed the category of common sense as a critique of the Enlightenment tradition which held the worldview of the common people as devoid of any sense and at the same time, as a critique of the pre-Enlightenment tradition as well which celebrated their worldview as *the* philosophy.[5]

According to Gramsci, common sense is the ensemble of cultural presuppositions by which the subaltern classes make sense of the world they live in. This worldview or consciousness is pre-theoretical, unsystematic, incohate and contradictory. In Gramsci's words [1973: 419] "Its (common sense's) fundamental characteristic is that it is a conception which, even in the brain of one individual, is fragmentary, incoherent and inconsequential, in conformity with the social and cultural position of those masses whose philosophy it is". This consciousness is primarily dominated by sediments of the ideologies of the elite:

> . . .this same group [subaltern classes] has, for reasons of submission and intellectual subordination, adopted a conception which is not its own but is borrowed from another group; and it affirms this conception verbally and believes itself to be following it, because this is the conception which it follows in 'normal times'—that is, when its conduct is not independent and autonomous but submissive and subordinate [Gramsci, 1973: 327].

However, common sense is not completely regressive carrying only the elements of dominant ideologies, but it contains progressive, autonomous elements as well which assert themselves when the subaltern classes act against the elite "occasionally and in flashes".

> This is the healthy nucleus that exists in "common sense", the part of it which can be called "good sense" and which deserves to be made more unitary and coherent [Gramsci, 1973: 328].

This contradictory character of common sense gives it a certain plasticity, i e, it can be selectively appropriated and reconstituted by different political forces. Given Gramsci's own political concerns, he suggested that any movement of the people should develop a critique of the common sense by "basing itself initially, however, on common sense in order to demonstrate that "every one" is a philosopher" [Gramsci, 1973: 330] and it should make the good sense or the progressive elements within the common sense "more unitary and coherent".[6] In other words, "...ideology, in this meaning of common sense, is not just an instrument of domination or a set of false beliefs. Rather, it is a terrain of struggle. It is the site on which the dominant ideology is constructed but it is also the site of resistance to that ideology" [Simon, 1987].

The present essay is about how dominant ideologies succeed in this site of struggle and produce consent among the subaltern classes. This process is illustrated, as we have suggested already, by exploring the screen image of MGR and its insertion in the pre-existing common sense of the subaltern classes in Tamil Nadu. We shall begin with how MGR's image was constructed in films.

III

Varanthira Rani (a popular weekly with circulation of about 3 lakh copies) predicted, in its issue dated February 15, 1987, that the then Tamil Nadu state assembly would be dissolved and fresh elections held. Though the prediction proved wrong, the basis for this prediction was itself interesting and significant. The prediction was made in the knowledge that new prints of MGR starrers were being produced! MGR films were repeatedly screened during election campaigns, and All World MGR Fans Association (which had about 10,000 branches in Tamil Nadu) served as the backbone of AIADMK.[7] MGR himself openly admitted; "Fans Association and party are not different".[8]

There has always existed a symbolic relationship between films and politics of Dravidian parties in Tamil Nadu. While this may sound like a truism, it is, yet, important to detail the modes through which films have sought to intervene in politics. This has happened in one of three ways: There have been films that have indulged in direct political propaganda; for instance, *Parashakthi, Velaikari* and *Oor Iravu*. More usually, reference to party symbols, and anagrammatic usage of party leaders' names in songs and in the course of dialogues has been a common feature of DMK style political propaganda. An interesting third usage has been the mixing of documentary footage with shots of the actual film in question. In *Panam* and *Thangarathnam*, during the course of a dialogue sequence, as an answer to a query, the scene shifts to reveal documentary shots of DMK Party conferences. And, of course, M Karunanidhi and C N Annadurai were film script-writers and there has been no dearth of film personalities being involved in party politics in Tamil Nadu. In fact, film actors beginning with N S Krishnan, K R Ramaswamy, S S Rajendran and, of course, MGR have always drawn crowds, especially to party conferences.

MGR began his acting career in films in 1936 with Ellis R Duncan's *Sati Leelavati*. His acting spanned forty years and 136 films, and for the first twenty years, he, by and large, acted in mythological roles.[9] Only from the late 1950s he was seen in social roles, achieving recognition in this regard with *Thirudathe* (1961). Henceforth, MGR's screen roles comprised several stereotyped characters all of which constituted 'MGR'.

A characteristic MGR role was that of a working man combating every day oppression. Thus he had acted as a peasant, fisherman, rickshaw puller, carter, gardener, taxi driver, quarry worker, shoe-shine boy, cowherd, etc. In fact, many a successful MGR films were titled thus: *Thozhilali* (1964) (worker), *Vivasayee* (1967) (peasant), *Padakotti* (1964) (boatman), *Mattukara Velan* (1970) (cowherd Velan), *Rickshawkaran* (1971) (rickshaw puller), and *Meenava Nanban* (1977) (fisherman's friend). Even in films where he assumes dual roles it is the subaltern MGR, who is given cinematic prominence. A striking example is *Mattukara Velan* (1970) in which he acts both as a cowherd and a lawyer. The cowherd outsmarts the lawyer throughout. Aptly enough the film was named after the cowherd.

These films are ostensibly about the oppression faced by the poor with MGR of course, being constituted as one among them. By employing a carefully constructed system of *mise en scene,* these films, celebrate his subalternity and create a mood for the audience to identify themselves with him. We shall cite just one such element of *mise en scene* here, that is food which constitutes the central concern of the everyday struggle of the poor. In *Thozhilali* (1964) MGR, as a manual worker, drinks gruel from an earthen pot, and licks pickle from off his fingers. In *Kanavan* (1968) he asks for *Neerakaram* (water in which previous day's cooked rice has been soaked) in his rich wife's house. In *Ninaithathai Mudippavan* (1975), he eats Ragi dosai, drinks *sukku kappi* (a hot concoction made of dry ginger, jaggery and water) and expresses his desire to have cold rice and cooked cereal. MGR's films endow these food items with a specific semiotic significance. It is immaterial whether the poor actually eat these kinds of food, though they often do. What is being presented here is a food-sharing structure that integrates MGR the Hero with the subaltern masses. In *Mattukara Velan* (1970), a cowherd MGR impersonates as a lawyer. When good food is served to him, he laps it up avariciously without bothering about the upper class manners, smearing his face in the process.[10] Along with food, other props like the design and colour of the costumes are also used to define MGR as a subaltern on the screen.

The social universe of the MGR films is an universe of asymmetrical power. At one end of the power spectrum are grouped upper caste men/women, landlord/rich industrialists, literate elites and, of course, ubiquitous male—all of whom exercise unlimited authority and indulge in oppressive acts of power; At the other end of spectrum can be found the hapless victims—lower caste men, the landless poor, the exploited workers, the illiterate simpletons and helpless women. Power is seen as all-pervasive, omnipotent and undifferentiated while its victims are always already meek, beaten and homogeneous in their suffering. Thus we have landlords who try to grab peasants' land [*Vivasayee* (1967)], rural rich who wield whips on farm hands [*Yenga Veetu Pillai* (1965)], moneylenders who exploit the poor [*Padakotti* (1964)], industrialists who dismiss workers at their whim [*Thozhilali* (1964)], avaricious men who desire others property [*Mukarasi* (1966)], city sleekers who leave poor rural girls pregnant [*Theier Thiruvizha* (1968)], casteists who don't allow their lower caste servants to enter their houses [*Nadod* (1966)], married men who desire othe women [*Vivasuyee* (1967)], etc.

The conflict between these superordinat oppressors and MGR as a subaltern and it resolution form the core of his films. MGR in the course of the conflict, appropriate several signs of authority of those who dominate. In a semi-feudal social formation where a wide spectrum of everyday practices like speech, dress, body language and food are semiologically differentiated into signs of authority and deference, this appropriation of signs of authority by a subaltern is significant.[11] Let us take up three such signs which repeatedly and prominently appear in MGR films. They are: (a) the authority to dispense justice and exercise violence, (b) access to education and (c) access to women.

(a) He fights oppression as an individual—though belonging to a subaltern class. As Sivathamby [1981: 41] puts it, "...the world of conflict exists as a world centred around the hero and his personal emancipation symbolises the emancipation from the social evil depicted". The odds he has to face and overcome in his struggle against injustice are insurmountable by ordinary mortals; but he brings humanly impossible situations under control and establishes justice.

MGR's role as an individual justicer, unfolds itself with particular emphasis on the stunt sequences that are present in any MGR film. These sequences are an articulated expression of his struggle against oppression: an unarmed MGR fights an armed adversary singlehandedly or engages in fighting landlord's hirelings. For instance, in *Maadapura* (1962) MGR with a fractured arm in sling fights with a mafia chief. Also, in quite a number of films, MGR demonstrates his skills in the extremely popular rural martial art of *silambam*. These fast moving sequences are so popular that MGR fans can recount effortlessly how many of them are there in different films and provide graphic details of them. Every time a new MGR film is released, film magazines carry letters from MGR's fans expressing their admiration of MGR's fighting skills.[12]

It is not just that MGR fights exploitation and oppression but he is always invincible in his struggle. He can only win and he wins with remarkable ease. He can bend crowbars and maul ferocious tigers with bare hands. In fact, MGR's invincibility has become a byword in popular consciousness and MGR himself has acquired cultic power. For example in *Manal Kayiru*, a non-MGR starrer, it is significant that a cowardly character, inspired by MGR appearing with a whip in his hand in the poster of a hit film of yester years (*Enga Veetu Pillai*) is suddenly transformed and beats up and defeats the villain [Samuel, 1983: 272-73].

MGR's role as a subaltern hero fighting for justice reveals two aspects: First, MGR appropriates to himself the right to dispense justice. Secondly, he appropriates the right

to employ physical violence. Both are in real life monopolies of the elite.[13]

(b) The second sign of authority of the superordinate classes which MGR appropriates on the screen is education/literacy. In *Padakotti* (1964) MGR is the only literate fisherman in the whole fishing hamlet. In *Thazhampoo* (1965) he is the first post graduate in the family of an ordinary plantation worker. In *Thozhilali* (1964), MGR, a manual worker, spends endless nights reading and earns a degree. In *Pana Thottam* (1963) and *Naan Yean Piranthaen* (1972), he pledges his house to acquire literacy. In *Petralthan Pillaiya* (1966), MGR, a honest tramp, adopts an abandoned child and vows to give him English medium education!

In MGR films the hero's use of literacy *as a weapon of struggle against oppression* is often contrasted with its use as a weapon of oppression in the hands of the elite. In *Padakotti* (1964), the villain who is a rich fish trader forces the poor and illiterate fishermen to put their thumb impressions on promissory notes, keeping them ignorant of their contents. But MGR, the only literate fisherman in the hamlet appears on the scene, reveals what is written in the promissory notes and saves the illiterate from the manipulations of the trader. In *Yenga Veetu Pillai* (1965), MGR, a literate worker, exposes the landlord's plan to grab other people's property through fake documents. Thus literacy, hitherto a privilege of the elite, now becomes an instrument of subversion in the hands of a subaltern hero, a challenge to education as a sign of authority.

(c) The third sign of authority which MGR appropriates on the screen relates to women. In a male-dominated society where the landlords could easily rape peasant girls and have concubines as a status symbol, access to and control over women's bodies is a sign of authority. Here, control over men of subaltern classes is exercised *inter alia*, by emphasising their inability to defend their women from being molested and raped. MGR defies this norm. In his films, he starts off as a poor man but ends up marrying a rich woman or as a lower caste man marrying an upper caste woman. If a powerful villain comes in his way, the poor MGR invariably succeeds. In *Mattukara Velan* (1970) he marries the daughter of a lawyer who earlier throws him out of his house for being a poor cowherd. The pattern repeats in *Thazhampoo* (1965), *Peria Idathu Penn* (1963), *Yenga Veetu Pillai* (1965) and *Pana Thottam* (1963). In *Nadodi* (1966) and *Num Nadu* (1969), a lower caste MGR marries an upper caste woman. In films like *Pallandu Vazhga* (1975), *Ayirathil Oruvan* (1965), *Mahadevi* (1957), *Theier Thiruvizha* (1968) and *Padakotti* (1964) MGR marries the desired girl after intense struggle against powerful villains.

It is significant that in MGR films, the upper class/caste women always desire a lower class/caste MGR. In this sense, MGR seems to grant women the 'freedom' to fall in love and get married despite class/caste difference. This 'subversion' of norms granted a certain notional freedom to women and at the same time assert the virility/valour of men of subaltern classes.

These three instances are not the only ones where MGR appropriates the signs of authority. In subtler and surer ways, he likewise uses other signs of authority such as dress, body language, etc. When the rest of the poor submit to the rich with folded hands, MGR confronts them, standing erect, with hands akimbo. Unlike others, he refuses to tie the towel around his waist, which is a sign of deference, but instead ties it around his head. And MGR was well aware of the significance of such a presentation. In his words, "it is not enough if you are a good man. You must create an image that you are a good man. Every man must have an image. Take Nagi Reddy or S S Vasan or myself. Each of us has a distinct image. The image is what immediately strikes you when you see a person or hear his name. You put forward an image of yourself if you want to get anywhere."[14]

Where and how does this screen image of MGR fit into the pre-existing cultural presuppositions or common sense of the subaltern classes in Tamil Nadu? It is in the heroic ballads which are a dynamic element of the subaltern common sense in Tamil Nadu, one may look for answers.

IV

The border area between Tiruchi and South Arcot districts is a country of dense cashew forests. Sometime in the recent past, in certain villages in this area, there existed a degrading custom that every woman has to spend her marital night with the village *Nattanmai* or the headman. This custom was put an end to when Kodukoor Arumugam beheaded three *Nattanmais*. Kodukoor Arumugam is still a hero of the poor in the region, celebrated in folk-songs.[15]

Throughout the Tamil countryside, there are such folk-heroes. To name a few: Muthupattan, Chinnanadan, Chinnathambi, Jambulingam and Madurai Veeran. They are remembered from generation to generation through popular heroic ballads.

Chinnathambi is a Chakkiliar (an untouchable leather worker). Lowly Chinnathambi accepted the local king's offer of a reward, for venturing into the forests to kill wild boars which were depredating peasants' crops. His valour launched him on a successful career which was traditionally denied to the Chakkiliars. He became the commander of the garrison guarding the king's fort at Thirukkurunkuti. The jealous upper caste Maravas, who were the traditional commanders of the garrison, murdered him. But the people from among whom Chinnathambi rose to power did not allow him to die; they immortalised him in ballads which are in circulation in Tirunelveli district [Vanamamalai, 1981: 161-63].

The ballad on Chinnanadan also belongs to Tirunelveli district. Chinnanadan *alias* Kumaraswamy married his two-year old cousin when he was eighteen. But he fell in love with a lower caste girl, Ayyamkutty, and refused to accept his cousin as wife. Though he had to forego his family property, he did not flinch from his resolve. While he was murdered by his own kin, his wife and Ayyamkutty committed suicide. The cult of Chinnanadan is alive in four villages and there are shrines dedicated to him around the small town of Eral in Tirunelveli district [Vananmamalai, 1981: 160-61].

Madurai Veeran ballad and cult are very popular especially in northern Tamil Nadu. Madurai Veeran, like Chinnathambi, was a Chakkiliar who eloped with King Bommanna's daughter and defeated his army single-handedly and with much valour. His spreading fame earned him the admiration of the king of Tiruchi and he worked for him combating the upper caste Kallar bandits. He recklessly flirted with the women of royal household and finally managed to carry away the king's sweetheart Vellaiammal. An incorrigible adventurer and violator of sexual and caste norms, Madurai Veeran was finally quartered by the king of Tiruchi [Vanamamalai, 1981]. It is not only that he is remembered in ballads and through several hundred shrines dedicated to him, but his pictures decorate the toddy and arrack shops in Madurai and Ramanathapuram districts.

The last of the ballad that I would cite is that of Muthupattan, a rebellious Brahmin. After discarding his sacred thread and removing his tuft, he skinned carcasses, ate beef and drank liquor—all these in order to marry two Chakkiliar girls, Timmakka and Pommakka. This Brahmin-turned Dalit protected the cattle of his father-in-law from marauding bandits backed by local landlords. He was finally murdered by the bandits by deceit [Vanamamalai, 1981: 155-58]. Near Papanasam dam, there is a temple dedicated to him. And there are such other revered heroes like Kathavarayan and Kouthalamadan [Blackburn, 1978: 136].

The common characteristics of these tales of love and valour are only too evident. In the words of Vanamamalai [1981: 172-73]: "All the heroes... are low-caste men who protect crops (Chinnathambi), protect the cattle (Muthupattan), protect the rights of the lower caste women (Hanuma, Kouthala madan, Jambulingam), challenge sexual caste norms (Muthupattan, Chinnanadan), challenge the privilege of the higher caste groups and demand equal rights for the lower caste men with talent and skill (Chennanna and Lakshmanna)."[16]

Our analysis of the heroic ballads so far, when read together with the points that we have made about the celluloid image of MGR in the previous section, would show that there is remarkable correlation between MGR on the screen and heroes of the ballads. However, the relationship between

the themes of MGR films and ballads is not only one of unity, but of divergence as well. This divergence in the themes demonstrate how MGR films have appropriated the ballads and reconstituted them. This divergence is important to see the differences in the ideological content of the films and ballads.

V

For at least two reasons, the heroic ballads constitute a progressive element/good sense in the ambiguous and contradictory mosaic of the common sense of subaltern classes. Firstly, in a social milieu, where common people's life is disrupted by landlord-instigated adventures like crop destruction, denial of irrigation water, dispensation of arbitrary justice, and raping of peasant girls, the people will naturally aspire towards a condition of stability in life processes. But, if people aspire for adventures, these are adventures carried out on account of their own free will to achieve what they consider to be just.[17] Thus, the people's aspiration that can be read in the popularity of heroic ballads is an aspiration to use their free will to get justice done.

Secondly, Madurai Veeran, Muthupattan, Chinnanadan and others, in their deaths affirm their essential humanity and this defiance of established norms and vindication of a common humanity have endeared them to subaltern classes ever since.

The ballad-like MGR films are bereft of this progressive content. Here, one should remember that cinema, especially the Tamil cinema in question here, follows a linear narrative sequence with the beginning rising to a climax and dovetailing to a neat finish. In these closed narratives, contradictions are rather ironed out than being allowed for their intensification leading to a rupture of the narrative. In MGR films the closure is such that a neat solution is offered for the injustice *within* the moral economy of the system itself. In other words, the subaltern protagonist in the film, i e, MGR, establishes what is considered to be just *within* the system and thus reaffirms the system itself. It is a world of transformed exploiters with untrasnformed property and power relations. In *Yenga Veetu Pillai* (1965) and in *Vivasayee* (1967), the cruel landlords become 'good' landlords. In *Ayirathil Oruvan* (1965) the pirate king who oppresses the poor undergoes a change of heart, but remaining a king. In *Nadodi* (1966), the rich castiest finally gives his daughter in marriage to MGR who is a poor man and of lower caste origin.

The moral economy of the system is reaffirmed through a different mode, in films where MGR acts as an elite hero. Here he often plays the role of a renouncer: In *Naan Anaiyittal* (1966), MGR constructs hundreds of houses in his land and asks the poor to occupy the houses and colonise the land. In *Nadodi* (1966), he gives away his plantation to the workers. In *Ithaya Kani* (1975), he divides the profit equally between himself and workers. The examples can be multiplied. Here, "...an appeal to the idea of sacrifice was really an appeal to the power that flowed from inequality. In order to be able to make sacrifices one needs to possess; he who did not possess could not sacrifice. The glory of the renouncer belonged to the 'possessor'; to talk of sacrifice was to talk of possession, and hence of power" [Chakrabarty, 1984: 149-50]. Thus the glory in these films is to the 'possessor' and not to the dispossessed, unlike in ballads.[18]

This transformation of the folk hero of the ballads into a non-problematic hero on the screen who seeks justice within the moral economy of system is a reconstitution of the former hero to serve elite interests.[19] This reconstitution is possible as the common sense of the subaltern classes is largely contaminated by the sediments of elite ideologies. For instance, there are folk-songs in rural Tamil Nadu which adulate the 'good' landlords.[20] But this is not all. The subaltern classes give assent to the reconstituted narrative since, as far as they are concerned, fragments of their reality are presented in these narratives. Besides the speedy and effective dispensation of justice and redressal of afflictions allow a measure of vicarious pleasures to creep into their otherwise impoverished lives.

VI

In the previous section we have noted the thematic divergence between ballads and MGR films and the ideological content of this divergence. The question is how MGR, whose presentation on the screen is ideologically regressive, could emerge as a hero for the whole of the Tamil-speaking area, while the heroes of the ballads could not.

Two things have to be borne in mind here: One, the process by which the localised folk heroes have been reconstituted as pan-Tamil heroes through the mediation of MGR, the actor-figure. Two, the selective appropriation of folk traditions that has carefully distilled away the defiance and the bravado of folk heroes to project a non-subaltern figure as the quintessential Tamil hero. The first was made possible through the technology of filmic form itself and through the political lineage granted to MGR by party support—both of which helped the emergence of the first all-Tamil hero. The second, can be seen in the alternate kind of heroes, promoted by Tamil Nadu's political elite.

A stark example of the second type of heroes in Tamil Nadu would be that of Veerapandya Kattabomman. Kattabomman was a feudal chieftain of Panchalamkurichi in southern Tamil Nadu who fought the British in his own interest and was eventually executed by them at Kayattaru on October 17, 1799. The elite in Tamil Nadu have made this non-subaltern a hero of the whole of Tamil-speaking area. Sivaji Ganesan erected a memorial for him in Kayattaru in 1970;[21] the then DMK government renovated the ruins of his mud fort at Panchalamkurichi at a cost of seven lakh rupees in 1974.[22] Every year a Kattabomman festival is organised at Kayattaru with state patronage, and during the festival various forms of folk arts depicting Kattabomman's life is peformed.[23] An extremely popular film on the life of Kattabomman was made in Tamil with Sivaji Ganesan in the lead role.[24]

Now let us turn to the first type of hero—i e, MGR in Tamil context. Unlike the folk heroes who are disadvantaged not to reach a wide audience, MGR had access to the medium of cinema. In dealing with the role of cinema in projecting a particular presentation of MGR and its effectiveness in reaching a wide audience, one has to analyse two aspects: (a) social context of cinema as a medium compared to other forms of performances and (b) the popularity of cinema as a medium in Tamil Nadu.

Cinema as a medium is relatively 'democratic', cinema tickets being comparatively cheap, it is possible even for the poor to watch a film once in a way. Moreover, the seating arrangement within any cinema hall is not according to one's social status, but according to whether one can afford a ticket or not. This is important because in witnessing shows of performing arts in rural Tamil Nadu, the order of seating of patrons is done hierarchically depending on one's social position. "The cinema hall was the first performance centre in which all the Tamils sat under the same roof. The basis of the seating is not on the hierarchic position of the patron but essentially on his purchasing power" [Sivathamby, 1981: 18-19]

These two factors—the affordability of witnessing a spectacle on the screen and cinema hall as "social equaliser"— made film an extremely popular entertainment for the subaltern classes. The popularity of the medium can be gauged from the fact that most of the village monographs brought out by Census of India 1961 records watching films as the only entertainment of the rural people in Tamil Nadu. It is indeed a thin line that divides entertainment from ritual and various kinds of social festivities. In fact, watching MGR films has become almost a ritual in itself. One can witness crowds gathered to watch MGR films, burning camphor before huge cut-outs of him, distributing water to the populace—as one would before a deity during temple festivals.

In addition, the proliferation of cinema halls in Tamil Nadu is extensive. In the whole of India, next to Andhra Pradesh, Tamil Nadu has the largest number of cinema halls. On March 31, 1986, Tamil Nadu had a total of 2,153 cinema halls out of which 820 are temporary halls.[25] The temporary cinema halls which are located in rural and semi-urban areas, are usually 'touring talkies' that are shifted from one place to another. The price of the ticket is very nominal. The 'touring talkies' are almost exclusively visited by the rural and semi-urban poor, while the rich, given their social status,

o the nearby town to watch films in pro- cinemas.

'his means that throughout Tamil Nadu, ple have access to cinema halls and ma is a very popular medium among the ple. While heroic ballads can circulate y within a limited locality due to elite tifity and non-availability of such elite- trolled medium like cinema, films could sent MGR to a wide audience throughout state. MGR could, thus, emerge as a hero the Tamil-speaking area as a whole.

VII

At least one important question remains: w did the subaltern classes fail to dif- entiate the screen image of MGR from GR in real life? One of the reasons could the large-scale circulation of a con- ucted *imaginary* biography of MGR that ojects his real life as not being different m his life on screen. Political platforms, wspapers, pamphlets, films, calendars and rty posters were used with remarkable ills in constructing this biography. The ocess of this biography-construction could the subject of a full length essay and I all cite only some stark examples here to ustrate this process.

MGR's early life was no doubt a life of isery. When he was just two and a half ars old, he lost his father. Due to acute verty, he had to forgo schooling and join drama troup as a child actor. It took him any years of hardship as a low-paid stage tiste before he could gain a foothold in ms. His modest beginning and acute verty of early days were well- propagated rough public speeches, pamphlets, party wspapers, etc. MGR himself often refer- d to his early days of sweat and tears handavan, 1983: 159]. For instance, in an l-India Radio talk on June 30, 1982 on the ee noon-meal scheme for the school-going ildren in Tamil Nadu he said, "This heme is an outcome of my experience of treme starvation at an age when I knew ly to cry when I was hungry. But for the unificence of a woman next door who ex- nded a bowl of rice gruel to us and saved s from the cruel hands of death, we would ave departed from this world long ago." The expensive biographies of MGR which are old in village fairs and urban pavements nd bought by the literate poor also provide raphic details of MGR's poverty.[26] Thus, IGR is not an elite person who tells tales f other peoples' oppression on the screen ut is himself a victim of oppression telling is own tales and those of similarly placed nen and women.

If MGR is a renouncer of wealth in films, e is, as this constructed biographies would ave it, a renouncer of wealth in real life as vell. Even before MGR became the chief ninister of Tamil Nadu, his munificence was vell-propagated. Hardgrave Jr [1979: 102] vrites:

> MGR is a symbol of hope for the poor in South India. Without children, he has adopted the poor as his wards. He is always the first to give for disaster relief; he supports orphanages and schools... MGR's generosity is well advertised, for it is the grist of his fame. When fires had destroyed some Madras hutments, he gave a lakh of rupees for relief and announced that the hundredth day of a film then running would not be celebrated because of the slum dwellers' sufferings... As one fan puts it "He is always there when the huts are burnt".

The party organisation of DMK had an enormous role in propagating MGR as a real life renouncer of wealth. DMK leaders, including its founder and popular leader late C N Annadurai, repeatedly projected MGR as a giver of wealth to the poor.[27] Pro-DMK dailies like *Dravida Nadu* and *Murosoli*, and magazines like *Mutharam*, celebrated MGR's munificence. A DMK propaganda song used during the 1962 elections ran as follows:

> The Palm of Bharatha Karnan
> Became pink because of
> His munificence.
> But the whole body of Dravida Karnan
> Became pink because of
> His munificence everyday.[28]

The Dravida Karnan is of course MGR.

The 'popular biographies' which circulate among the poor, again, celebrate MGR as a renouncer. One of the events which is repeatedly mentioned in these biograpies is MGR's auctioning off of a sword made of 110 sovereigns of gold to raise war funds during the 1962 Indo-China war. Often it is rhetorically posed, "who will have the large heart to donate 110 sovereigns of gold". People do have an obsessional attachment to gold and such narration effectively poses MGR as a renouncer of wealth.[29] If MGR gave up his acting career and became the chief minister, it is because, according to these biographies, he was a renouncer:

> ...if he produces four or five films, he can earn crores of rupees. He knows this very well.
>
> Then why is he not acting in films? If he decides to act in films, no law can prevent him...
>
> ...Do you know what is the reason for his giving up film acting?
>
> He wants to serve the people of Tamil Nadu.
>
> He wants to wipe out their problems...[30]

MGR's supposed invincibility was, time and again, constructed by various kinds of media so much so that he was conferred a degree of immortality in real life as on the screen. He was presented as one who was thrice-born: The first one was when he was actually born like rest of us; the second birth was when he survived an attempt made on his life by his film world associate and a popular Dravida Kazahgam propagandist M R Radha on January 12, 1967, and his third birth was when he recovered beyond expectations from his debilitating illness in 1984. In fact, unlike most of the DMK leaders, MGR's birthday was never celebrated and his age was a secret. After 1967, his followers were encouraged to celebrate January 13, the day on which MGR recovered from bullet injuries, as his birthday. In his autobiography, he writes: "As you all know, I was shot at on January 12, 1967. People think that I died on that day and I was reborn on the next day. That is why they greet me on that day."[31]

Thus, through particular constructions of MGR's biography, his films were portrayed as an imitation of his real life. One can cite several examples of the effectiveness of this obliteration of distance between the cinematic and the real. G K Ramaswamy [1979: 55] in his study on MGR fan clubs notes:

> The members are not able to go beyond the impressions created through the films and MGR's character is believed to be what is depicted in his films. This is clear from the fact that when the followers were asked to substantiate their contention that MGR is good or a principled man, they invariably cited instances from his films.

The most resounding proof of how people do not differentiate MGR, the image and MGR, the real, can be had from what his followers did during his serious illness in 1984. In *Olhi Vilakku* (1970), MGR's hundredth film, MGR carries on a losing battle with death. A widow to whom MGR has provided asylum sings to god, with inconsolable sorrow, to spare MGR's life and take away hers instead. This very song echoed throughout Tamil Nadu when MGR was ailing. If god replied to this song of grief in the film by sparing MGR's life, it could happen in real life also! He survived. When he finally died, it was so sudden that the people were not given an option!

VIII

The significance of MGR as a phenomenon and the elite who supported him, thus, lies in the recognition that the mosaic of common sense or the untheorised philosophy of the subaltern classes is an important terrain of political intervention. By using this site of struggle, which is often ignored by other political forces and by reconstituting a progressive element of the common sense for reactionary politics, MGR could join the ranks of Madurai Veeran, Muthupattan and Kathavarayan and

supersede them. MGR's success rests, to a large extent, on this.

Unfortunately, the various shades of political dissent in Tamil Nadu, ranging from the DMK to the CPI(ML), dismissively characterise MGR as a 'lunatic' and a 'clown'. It is time these self-assured 'philosophers' sit up and take a few lessons from 'lunatics' and 'clowns'—of course, not to practise MGR style reactionary politics but to appropriate its 'other'.

Notes

[This essay wouldn't have been written but for the encouragement and intellectual partnership of S V Rajadurai and V Geetha. I have also benefited a lot from my discussions with the following friends: Arun Patnaik, Barun De, Anjan Ghosh, R S Rao, Nirmal Sengupta, Sarajit Majumdar, A Venkatachalapathy, J Jeyaranjan and Anandhi, S. My thanks are due to all of them.] .

1 James Freeman's [1979] excellent study of Muli, a scheduled caste labourer in a Orissa village and Michael Moffatt's [1979] study of Pariyans of Endavur village in Southern Chengleput district are some of the exceptions.

2 M G Ramachandran presided over Tamil Nadu as its chief minister from 1977 to 1987 with a brief break in 1980. He was born in Kandy in Sri Lanka in 1917. Driven by poverty, he began his career as a child actor in plays by joining at a tender age Madurai Original Boys Company owned by M Kandaswamy Pillai. After protracted struggle, he emerged as an immensely popular film star on the Tamil screen. Along with his acting career, he became active in the DMK politics. In 1972 he founded a separate party, Anna Dravida Munnetra Kazhagam, which was rechristened as All-India Anna Dravida Munnetra Kazhagam during Emergency. After prolonged medical battle and ill-health, he died on December 24, 1987 as the most popular leader of the poor in Tamil Nadu.

3 *The Statesman*, January 17, 1988.

4 It is because the material life conditions of the subaltern classes do not produce the immediate consciousness of their existence, that their 'actual' consciousness can be effectively mediated. Thus it has been possible for MGR to pose real problems and offer imaginary solutions.

5 On Gramsci's category of 'common sense', see: Cirese, 1982; Davidson, 1984; Patnaik, 1988; and Saldanha, 1988.

6 According to Gramsci [1973: 332-33]: "If it [Philosophy of Praxis] affirms the need for contact between intellectuals and simple it is not in order to restirct scientific activity and preserve unity at the low level of the masses, but precisely in order to construct an intellectual-moral block which can make politically possible the intellectual progress of the mass and not only of small intellectual groups".

7 Soon after MGR founded Anna DMK in 1972, the DMK promoted an organisation called 'Tamilar Padai'. The members of 'Tamilar Padai', who were mostly urban lumpens, tried their best to disrupt the screening of MGR starrers.

8 *Thuglak*, February 1, 1984.

9 MGR appeared as Vishnu in *Dakshayagam* (1938), as Indra in *Prahlada* (1939), as Parameswara in *Sri Murugan* (1946) and as Indirajit in *Seetha Jananam* (1947).

10 The films we cite in the course of the essay are only examples. The patterns presented repeat with little variation in large number of MGR films.

11 For a general discussion on this, with illustration from peasant insurgencies in colonial India, see: Guha, 1983: Chapter 2.

On this semiological differntiation of everyday practices into signs of authority and deference note what Beck [1972: 155], writes "...Food passes between some groups but not between others, and guests of a given community are invited to sit on the porch of some homes but in the courtyard of others. Ranking is also implied in the form of address used between groups, and by subtle body gestures that accompany conversation. For example, a man of one community may cover his mouth when speaking, or stoop slightly and look at the ground, while another from a caste that claims superiority to the first may stand erect, fold his arms on his chest, and look straight ahead. Adjustment in clothing can also serve as indicators of status. Women generally draw the end of their sari over both shoulders when in the presence of superiors. Men, similarly, lower their long skirt like vesti... so as to cover their calves when they wish to indicate deference." The widespread prevalence of such feudal semioticity in Tamil Nadu has been established in several studies [Ramachandran and Manoharan, 1981; Den Ouden, 1979; Good, 1983: 232-33; Ramaswamy 1983: 104, 108; Naidu, 1988: 119-20 and Muthiya, 1989]. Several news reports have also brought out this fact. [For example, see: *Junior Vikatan*, September 25, 1985, October 23, 1985, May 21, 1986, November 23, 1988, and May 3, 1989.] Again, this is true not only among the Hindus as ably shown by Poornam Demel [1988] in his study of the relationship between Vanniar Christians and Harijan Christians.

12 The comments in these letters run as follows: "MGR's fight from the rickshaw is wonderful", "MGR who fights from the rickshaw is indeed an youth", "MGR rotates life a top and fights. No actor in the world can fight like him" [see: *Cinema Kadir*, March 1970 and August 1971].

13 It would be interesting to note here what Hobsbawm [1985: 35] writes about social bandits: "These are the men who establish their right to be respected against all comers, including other peasants, by standing up and fighting—and in so doing automatically usurp the social role of their 'better' who, as in the classic medieval ranking system, have the monopoly of fighting. They may be the toughs, who advertise their toughness by their swagger, their carrying of arms, sticks or clubs, even when peasants are not supposed to go armed, by the casual and rakish costume and manner which symbolise toughness."

14 N Krishnaswamy, 'From Hero to Mesiah... Step by Step', *Indian Express* (Madra January 9, 1988.

15 *Junior Vikatan*, September 9, 1987.

Though the report does not give deta it is only evident that the women th degraded should have belonged to poo households/lower castes.

16 The same conclusion has been arrived at other folklore scholars like Blackburn [19 and Loordu [1979].

17 See Gramsci [1985: 372-74] for an elabor tion of this argument.

18 For an example of how this category of nouncer was used by Indian National Co gress, during the nationalist struggle mobilise people, see: Hardiman, [198 169-70.]

19 The efforts to change the radical content ballads is a regular process. In this regar Vanamamalai [1981: 187] cites an importa instance. In the recent recitals of Muthupa tan ballad, his wives are narrated a Brahmin girls brought up by a Chakkilia Unlike in the original ballad, they are no Chakkiliar girls. On enquiry it was foun that Muthupavalar of Kallidaikurichi wh sings the ballad was pressurised by uppe caste Vellalars and Brahmins to change th ballad. In the same way, there are purani insertions in ballads which portary lowe caste Madurai Veeran and Kathavarayan a Brahmins [Blackburn, 1978: 140-43]. Here one must bear in mind that ballads are essentially, oral narratives that stand to b transformed over periods of time, ofte reflecting the reconstituted social milieu Thus, they are open-ended and capable o infinite reinterpretations.

Communalism and Working Class
Riot of 1893 in Bombay City

Shashi Bhushan Upadhyay

The participation of social, religious or occupational groups in communal riots raises the problem of the concerned group's integration into the communal polity. In the context of the working class it has been argued that workers have been equally, if not more, responsible for adding to the dynamics of communal politics. This view has been questioned by some scholars and the idea of 'levels of consciousness' has been introduced to explain the apparent ease with which workers participating in workers' struggles have broken into communal riots soon thereafter. This paper studies the 1893 communal riot in Bombay and argues that while the workers, the majority of them being Marathas, were involved in the riot on the Hindu side, this did not lead to the development of a long-term communal consciousness among them.

THE participation of any social, religious or occupational group in a communal riot raises the problem of its relative integration to the communal polity. In the context of the Indian working class, Dipesh Chakrabarty's study of the Calcutta jute mill workers[1] is a seminal contribution. Here he argues that the workers were equally, if not more, responsible for adding to the dynamics of communal politics.[2] This view has been questioned by some scholars[3] and S Bhattacharya, in the context of the activities of the Bombay cotton mill workers during 1928-29 has introduced the idea of 'levels of consciousness' to explain the apparent ease with which the workers participating in the general strikes of 1928 and 1929 broke into communal riots soon after each strike.[4]

This paper tries to argue that although the intensity of the riot in 1893 in Bombay showed strong communal sentiments on both sides and the workers, majority of them being Marathas, participated on the Hindu side, it did not lead to the development of a long-term communal consciousness in them. Nor was it the most representative form of their activities. The 1890s also witnessed the increased participation of the workers in strike activities which matured over the years leading to the general strikes of 1919 and the 1920s. We also find them participating in protests against the imprisonment of Tilak in July 1908 with equal vehemence. The hardships which the workers faced in their homes and mills brought them into confrontation with their employers. But, at the same time, it also gave rise to sectarian feelings in them in their defensive bid to cope with their new lives. Feelings along the lines of caste, region and religion were prevalent. Their continuing links with the countryside also helped in maintaining their old-world loyalties. Religion was a major factor in their lives. It provided them refuge from hostile atmosphere, consoled them in adverse conditions, also gave them a hope for the future. At the same time, however, it provided an opportunity for the communalists to channelise these deep religious feelings into communal ones. That was precisely what happened in Bombay in 1893 when cow-protection propaganda and communal speeches and counter-speeches played on the religious sentiments of the people and led to a major conflagration involving a large section of the city's population and the large majority of the textile workers.

I
Demographic Picture

The two main religious groups in Bombay were Hindus and Muslims.[5] The Parsis and Christians, though significant formed very small minorities; and Jews, Jains and Buddhists were numerically insignificant. The percentages of the Hindus and Muslims in the total population of Bombay was as in table 1.[6]

This shows that the Muslims were never more than one-fifth of the total population of Bombay. But their distribution was not even and there were localities in which Muslims tended to congregate while there were some other localities in which the Hindus formed as much as 90 per cent of the population.

The Muslim population was preponderant in four sections—Chakla, Umarkhadi, Khara Talao and Second Nagpada—where they formed more than 60 per cent of the population while in all the other sections the Hindu population was more numerous. Table 2 shows the percentage of Muslim population to the total population of these four sections.[7]

There was further concentration within each section,[8] and hence the emergence of some Muslim 'mohollas'.

The majority of the Muslims were as much immigrants to the city as the majority of the Hindus, as is shown by the relatively fewer women than men (Table 3).[9]

Because segregation had occurred in other areas the percentages of Muslims to the total population of the mill areas were lower than overall city average as is shown in Table 4.[10]

Though very small, these figures were not less than the relative proportion of Muslims in the total workforce. In 1881, for example, Muslims constituted only 8.13 per cent of the total number of cotton mill workers and by 1921 this had gone down to 5.15 per cent (Table 5).

The Muslim workers could be found in all departments of the mill and there was "little trouble getting Hindu and Muslim weavers to work together".[11] So generally, there was at least no overt tension between the Hindu and Muslim workers in the mill. The situation, however, became different during and immediately after the riots as is shown below.

II
Background to the Riot

Talking about the causes of the riot, R H Vincent, the acting commissioner of police, did not have the slightest hesitation in ascribing "the origin of the ill-feeling between the two races to the anti-cow-killing agitation of Hindus".[13]

But, on August 22, 1893, after the riot ended, one P B Joshi wrote to the secretary that the "real cause of the riot is... not the cow-killing agitation, but the Prabhas Pattan affair".[14] And the British government, acting diplomatically, 'observed' that "while the cow-protection movement has undoubtedly been pushed of late with growing vigour, the movement itself is not a new one". It also wanted "to avoid gratuitously wounding the feelings of Hindus", and so "the governor in Council hesitates to adopt the opinion that the cow-protection movement is the principal cause of these riots". The governor in council therefore, decided that the main cause of "the outbreak was the infection spread by the riots which had broken out in other parts of India, and especially those at Prabhas Pattan, and the uneasy feeling generated through them amongst Muhammadans that Muhammadanism and the followers of that faith generally were suffering at the hands of the Hindus".[15]

It is true that the cow-protection movement was not a new one. But whenever and wherever it was pushed with 'growing vigour' it started a process of communalisation which culminated in a single or multiple riots.[16]

In Bombay, the society for preservation of cows and buffaloes, named Gaurakshak Sabha, was first established on July 28, 1887. Its president was not a Hindu but a very

prominent Parsi millowner, Sir Dinshaw Maneckji Petit, who had been awarded the knighthood previously. Of two secretaries, one was Parsi and the other Hindu.[17]

The intent and purpose of this society, apart from the protection of cows is not known. Most probably it did not have any other motives. The presence of the persons who were very 'honourable' in government records,[18] seemed to prove that. This society held meetings in different parts of the presidency, like Ahmedabad, Poona, etc, apart from Bombay, in which speeches were made to mobilise support to stop the killing of cows. In the beginning the nature of the movement was not communal as was shown by the support given to it by newspapers like *Kathiawar Times* which was edited by a Muslim, in its issue of April 14, 1888.[19]

Whether the nationalists found it an already existing base to mobilise support for their cause, or whether some of them tried to use this religious symbol for their anti-government propaganda, like Tilak's Ganapati and Shivaji festivals later on, is not known. But at some point anti-British sentiments did appear. One Shriram Swami went about lecturing in Poona, Sholapur and Bombay from the platform of this movement and it was reported that, on July 14, 1889 in Sholapur, he said that "from want of unity between Hindus and Muhamadans the whole wealth of the country is carried to England". He, however, ended his speech "making an appeal" to stop kine-killing.[20] It cannot be ascertained whether this 'appeal' was just a postscript or genuine feeling. The fact remains that he was also making anti-British propaganda through this medium.

One police report goes to the absurd extent of stating that the entire cow-protection movement was the handiwork of the young generation of Hindus who visited Europe and had "imbibe(d) their hatred for the British from the foreigners" and "their vanity is equal to their political cheek and they look upon the British as aliens who feed upon and keep them from their birthright". It asserted that the "cow-protection movement was only a means to an end".[21]

This movement worked the other way also. While some nationalists took advantage of it to disseminate nationalist thinking, there were also some zealots who carried on their propaganda for cow-protection from the nationalist platform. In a meeting of representatives of Indian National Congress held at Jalgaon on July 28, 1889, Chintamanro Vakil of Bhusaval, gave a lecture on the protection of cow.[22]

In another instance, during the convention of the Congress in Bombay in December 1889, the Nagpur Cow-Protection Association distributed thousands of pamphlets entitled *Prarthana* exhorting the people to agitate against cow-killing.[23] In fact, sometimes the cow-protection and anti-British propaganda got so mixed up that there were some who blamed the Congress for the riots.[24]

Though sometimes Hindu nationalist and religious sentiments merged, the nationalists failed to dominate this particular movement. In fact, there is no evidence that they even tried to do that. The more religious and fanatic elements took over the movement in later years. There were no more talks of the drain of wealth or of birthright. Now the cow became the centre of everything. It was not a 'means to an end' but an end in itself.

There were much wider links of these cow-protection bodies all over India. So we learn that one Shriram Swami Alanangi was sent from Allahabad to lecture about cow-protection in Bombay on December 18 and 28, 1889.[25] Similarly, one Jairam was sent by Bombay Gaurakshak Sabha to lecture in Ahmedabad on January 27, 1892.[26] Such instances were very common during this period.

Frantic activities were going on in the entire Bombay presidency on behalf of cow-protection movement. Similar bodies had sprung up in various places like Sholapur, Nagpur, Poona, Kolhapur, Satara, Khandesh, etc, either on their own initiative or fostered by emissaries from other places. And although these activities had not "gained much hold" as yet, the official circles were worried about the "feeling of unrest and religious antagonism" which this agitation was causing and had started talking about 'watchfulness' and 'precautionary measures'.[27]

The meetings and propaganda of the Bombay Gaurakshak Sabha went on as

TABLE 1: PROPORTION OF HINDUS AND MUSLIMS IN TOTAL POPULATION

	1881	1891	1901	1911	1921
Total population	773,196	821,764	776,006	979,445	1,175,914
Percentage of Hindus	65.2	66.1	65.5	67.8	71.2

Average percentage in the mill areas	9.8	9.9	10.4	10.1

TABLE 5: COTTON MILL WORKERS ACCORDING TO RELIGION[12]

Year	Total No of Cotton Mill Workers	Total No of Hindu Workers	Ratio of Hindu Workers to Total (Per Cent)	Total No of Muslim Workers	Ratio of Muslim Workers to Total (Per Cent)
1881	25,241	22,821	90.41	2,053	8.13
1911	1,18,512	1,04,400	88.09	12,575	10.60
1921	1,17,110	1,10,065	93.98	6,032	5.15

the sabha was held at the Mulji Jaitha Market. It announced that the subscriptions collected from August 2, 1887 to June 30, 1888 was Rs 11,932. The firm of Morarji Gokuldas presented 83,000 sq yards of land in Chembur for the construction of cattle sheds. Again on September 1890, a public meeting was organised where Swami Achutanand gave lecture on the protection of cows.

Though not much evidence is available, it is perhaps about this time that the cow-protection agitation was undergoing an imperceptible change. Its meetings became more frequent. Co-operation from societies in the other parts of the presidency was sought and given. Money was collected from wealthy people. A change in the nature of activity also came about. Earlier this society had satisfied itself with holding the meetings and distributing the pamphlets and hand bills. But now it started a somewhat more active mass contact programme by collecting signatures and selling and distributing pictures which made more appeal to the illiterate masses. The religious movement now acquired a communal overtone. The cow was no longer an end in itself. It again became a means to an end. But now the end was different.

In January 1891, pictures and illustrations of a cow "supplicating for protection were on sale at a pice a piece in Bombay".[28] R H Vincent, the commissioner of police, wrote that "pictures and pamphlets illustrating the sanctity of cow and the sin of slaughtering it were also sold and distributed in thousands all over the presidency, but chiefly in Bombay".[29]

Another more sinister picture was that of a "cow looking quite *gharib*... being milched by a handsome matron (in the dress... of a Dakshini Brahmini). A plump healthy child... playing near. In the background was a Brahmin in a reverent posture, worshipping the cow, and on the other side a Muhammadan 'mlechcha' of a butcher, with a hangdog, villainous face, brandishing a long knife and looking sinisterly at the cow."[30]

Such pictures and posters would obviously do the intended work. In August 1891, one Abdul Rahman of Bombay distributed a Urdu pamphlet in Ahmedabad "strongly attacking the Gaurakshak Sabha and stating that the agitation was only meant to excite the Muhammadans and to cause ill-will throughout the country".[31]

The cow-protection propaganda, however, went on apace. On November 1891, one Jivaraj Jetha collected about 3,000 signatures to be presented to the Hindu Council members. On November 7, 1891, the secretary of the Gaurakshak Sabha asked the police commissioner for the permission to parade the cows on the roads in Bombay after the general meeting to be held on November 8. The commissioner declined to grant the permission. The meeting, however, was held before an audience of about 4,000 meeting.[32]

In March 1892, six people arrived in Bombay from Sholapur "to solicit funds for the purchase of cows which had fallen into the hands of butchers in consequence of famine in that district".[33] By the end of September 1892, the Nagpur Gorakshak Mandali sent four delegates to Bombay to collect "Rs 60,000 in aid of the Nagpur Fund". Pandit Keshav Narain Vaidya from Kolhapur published 25,000 copies of four pamphlets on cow-protection and distributed most of them in Bombay in September. A meeting of the Bombay sabha, held on October 29, 1892, circulated a printed appeal which exhorted the people to contribute to the Nagpur Fund.[34]

In April 1893, the sabha again wanted to take a procession of thousands of cows through the streets of Bombay, but again the police commissioner did not permit this.[35] Despite that, big meetings were held on April 15 and 16. The police report says:

> On the former date there was an immense procession, about 12,000 people of Hindus, chiefly Kachis, with a sprinkling of Parsis, in the quarter of the town inhabited by them. House were covered with flags, etc. Some 200 milch cows gaily decorated were collected in Madhav Bagh, and a great many speeches were made in favour of the movement. On the sixteenth a sort of regular meeting was held in Madhav Bagh, which was attended by some 20 delegates and about 15,000 persons. Addresses were delivered and prizes were bestowed on the owners of the best-fed cows. Medals were also given to the lecturers who had worked zealously for the cause. Many Hindu shops were closed in the honour of the event, and a theatrical performance took place in the New Alfred theatre in the aid of the Gorakshak Mandali. The principal movers in the matter wanted very much to parade all the cows they could get hold of in the procession through the streets, but they allowed themselves to be persuaded that it would be better not to do so in the town, where there were so many people not in favour of the cow-protection society.[36]

It was in April 1893 that the police commissioner thought that riot would take place because "feelings were running very high indeed".[37]

In July, another cow-protection society named Gau Palan Updeshak Mandali, with Lakhmidas Khimji as its president, came into being. It took an even more extreme position and its "leader and members displayed still greater virulence in the dissemination of their views". It also brought out a paper named *Gau Updeshak*.[38]

Now both the societies started competing with each other in taking more active step to stop the killing of the cows. So while the "agents of the Gorakshak Mandali (or sabha) and their friends took occasion on the night before the Bakr-Id to go about the town and ascertain in what places the Muhammadans intended on the following morning to kill cows" in order to prevent it,[39] the Gau Palan Updeshak Mandali "ob-[...] where they intended to keep all catt[le] intercepted and purchased by their agents e[n] *route* to Bombay."[40]

The societies also tried "to enlist the sym[pathies] of several Hindu constables" an[d] sometimes succeeded.[41] In such an a[t]mosphere even minor incidents had th[e] potential for causing disturbance. So, whe[n] a restive cow, which was being escorted t[o] the cattlehouse by a Muslim constable fe[ll] into a ditch and died, "there was ever[y] likelihood of a disturbance". People gathere[d] and accused the constable of maliciousl[y] murdering the cow and did not allow the car[]cass to be removed for 16 hours.[42]

Such activities and incidents were boun[d] to have their impact sooner or later. In th[e] minds of the middle class Muslims i[n] Bombay, some sort of sectarian sentimen[t] had already been injected during the lat[e] 1870s and 1880s by the Anjuman-i-Islam, a "non-religious yet communal body". Th[e] issues centred around Turkey and Khilafat had started to create pan-Islamic sentiments. But these things were mainly limited to the middle class Muslims. The cow-protection propaganda, however, reached down to the lower class Muslims that they would be deprived of their cheap and chief article of food. Some zealots of the sabha also went into the Muslim-dominated areas and preached their creed, despite warning from several quarters.[43] All this was slowly preparing the ground for a conflagration by alienating the two communities from each other and creating tension between them. In such an atmosphere came the news of the riots at Prabhas Pattan.

It is true that the news of riots from Rangoon, Bareilly, Azamgarh, etc, had already been reaching the city and people's feelings were getting polarised. But the physical proximity of Prabhas Pattan made it more possible for both the sides to carry on active propaganda and to arouse sectarian feelings. The riot in Prabhas Pattan (in the Muslim-ruled state of Junagarh) had occurred by the end of July 1893, on the Muharrum day in which many Hindus were said to have been killed.[44] Immediately after an agitation had started in Bombay. On July 30, 1893, Javerilal Yajnik spoke in a meeting of Hindus demanding "condign punishment for the offenders" and talked of "avenging justice." He said that "not only one of the most sacred temples dear to the Hindus had been defiled, but the holy *bithal* of the god Shree Krishna wantonly polluted, innocent monks and religious ascetics... were, in violation of inter-communal laws, ruthlessly massacred."[45]

The Muslims were not far behind. Aga Khan, at a counter meeting, talked about the killing of their co-religionists, desecration and destruction of their mosques by the Hindus. The atmosphere had become suddenly surcharged with passion.

Another campaign started in Bombay. The Hindus went around asking for subscriptions to get the offenders, punished

ile the Muslims did the same thing among eir co-religionists for the defence of e 'innocents' who were said to be suffer-g at the "hands of the local (Hindu) thorities".[46]

Both the cow-protection societies started opaganda work against the Muslims and llected money to get "the offenders unished". Deshmukh of Gorakshak Sabha ganised a public meeting at Thakurdwar Maratha Hindus on this issue. Many hers went around making inflammatory eeches. One Shivram Sudhale and arayan Trimbak Vaidya went, on one unday "from house to house to urge eople to sympathise with Prabhas Pattan fferers".[47]

There were many such instances. housands of rupees were collected, eeches were made denouncing Muslims, nd exhortations were made to support the fflicted Hindus in Prabhas Pattan. Such eetings were held almost every day. In one eeting by Gau Palan Updeshak Mandali, ohanas, Banias and Bhattias "outbid each ther in their subscriptions".[48]

There were attempts to hold meetings mong the mill workers also. We have vidence of one such meeting by Gau Palan Jpdeshak Mandali. But when questioned by he authorities, Lakhmidas Khimji, the ociety's president, denied this.[49] But judg-ng by the pace of the propaganda, it was ot unlikely that such meetings were held.

The Muslims were not sitting silent either. t was reported that "a large number of espectable Musalmans from Kalyan" rrived in Bombay during the Muharrum estival "complaining to their co-religionists (and afterwards to the police commissioner) hat they had not received fair treatment at he hands of the local (Hindu) authorities".[50] Many Muslims in Bombay were also holding meetings and collecting money to help the arrested Muslims in Prabhas Pattan. Their opinion was that "Hindus had circulated exaggerated reports, and succeeded in exciting the sympathies of their co-religionists in Bombay and subscribed large sum of money which would enable them to trump up charges against the Muham-madans".[51] There were rumours that the Muslims were discussing this issue "at dif-ferent mosques in the city", but the police report denies any such happenings.[52] There are, however, definite reports of a large meeting convened on August 10 "to arrange for the legal defence of the accused, and Rs 12,000 were subscribed on the spot".[53] On the morning of the eleventh also there was "a large meeting of Muhammadans especially (lower classes) . . . at the house of Haji Kasam Haji Ismail . . . About 1,000 per-sons who could not accommodated were standing from 7 to 8 in the streets, and it is rumoured that they were paid for the riot".[54]

And in the afternoon of the eleventh the riot started.

III

Events

It was the city's third communal riot in the nineteenth century. The first one was in 1851, when a Parsi journalist named Byramjee Ghandi had published a portrait of prophet Muhammad in his journal and the mobs were incited to a riot against the Parsis.[55] The second one took place in 1874, again between Muslims and Parsis, when a Parsi named Rustomjee Jalbhoy made a reference to the prophet in his translation of the works of Washington Irving.[56] But in none of the above two the magnitude and intensity of the riot was similar tc that of 1893. It was because the Parsis were few in number and were limited in a few areas, while Hindus and Muslims were spread all over the city.

When the riot started, the police was not exactly caught unawares. Since weeks past, rumours had been afloat about the possi-bility of such a riot. The administration did not take much precautionary measures and "as Bakr-Id, Muharrâm and several Fridays passed without any disturbances",[57] it was lulled into a false sense of security and order. Although there were strong rumours that the riot might start on August 11,[58] not many arrangements were made to such a con-tingency. Some policemen were posted near Juma Masjid but their numbers were grossly inadequate given the enormity of the problem.

When the worshippers went into the masjid for prayers, they were not carrying any sticks or weapons. The only thing observed was that "the attendance of worshippers exceeded the usual number by about a thousand souls".[59] But when the worshippers came out of the masjid after prayers, many of them were carrying sticks, etc, which lends credence to the opinion that the riot was pre-arranged.

Coming out of the masjid at around 1.45 p m the Muslim mob, "despite the endeavours of the respectable members of their community", started shouting *deen*, and rushed towards the Hindu temple situated in the nearby Hanuman Lane. The policemen posted there tried to restrict them and a fight ensued in which stones and other missiles were freely used. Some of the policemen got injured. But, finally, with the arrival of reinforcements, the rioters were repulsed.

As soon as they were driven away from this area, they spread out in various areas and along with many others started rioting there. Thus rioters could be seen in Bhendy Bâzar, all along Erskine Road, Null Bazar, Falkland Road, Duncan Road, Jagjivan Keeka Street and Cowasjee Patel Tank Road. They attacked vehicles, and tramcars were pelted with stones and "infuriated mobs of Musalmans surged from street to street, car-rying havoc and destruction in all directions. To trace the course of the tumult is beyond my powers, for the rioters seemed to be in every place at once".[60]

The military was called in. Many com-panies from Marine Battalion, 5th Bombay Infantry, Bombay Light Horse, etc, were ordered. But even this did not prove very effective because when the rioters were "driven back and dispersed by the police and military from one locality, it was only to unite in another and wreak their wanton rage on the hated Hindus and any who sought to hinder them. Wherever they went, their tactics were the same. Sticks and bludgeons were the weapons generally employed, and only too frequently with fatal results. Volleys of stones, broken files and other missiles were flung both from the streets and from the windows and tops of houses."[61]

Many Hindu temples in Nissanpada, near Kumbharwada and other localities were desecrated. The rioters broke the idols and hurled them on to the roads, to be trodden under foot."[62]

To the killing and desecration of religious places, another motive was soon added—that of loot. One pay clerk in the em-ployment of GIF Railway Company was assaulted and robbed of about Rs 4,000 of government money.[63] Many shops in Bhendy Bazar and other places were looted and their property destroyed.

It was only to be expected that the Hindus, among whom religious propaganda had been going on for some time and who were so preponderant in number, seeing their temples desecrated and destroyed, their co-religionists attacked and their property looted, would retaliate. The retaliation came right on the first day. Within an hour of the original outbreak by Muslims, one Muslim conveyance driver was "brutally assaulted".[64] On Falkland Road, Jagjivan Keeka Street and Duncan Road, the Hindu *tallimwallas* fought pitched battle with the Muslim *tallimwallas* wounding many of the latter.[65] Similarly in Arthur Road and Grant Road, several mobs of Hindus committed "retaliatory acts of violence".[66] At Kamathipura, a large body of Hindus at-tacked the mosque in that area and intense fighting ensued.[67] In Umarkhadi Road and neighbouring areas many mobs of Hindus attacked solitary Muslims and at Chinch Bandar, both parties fought pitched battles.

The mill workers were also brought into the fray right on the first day, though their participation was still limited. In Chinchpokli, the Hindu mill workers attacked the Muslim weavers only to be dispersed by the military,[68] and "towards midnight of the 11th 300 Hindu mill-hands came out, bent on revenge, at the Arthur Road; but were kept in their chawls with great difficulty."[69]

While people from both communities attacked each other, desecrated temples and mosques, looted property, both of them "turned upon European and native police and military". Little regard was shown for the authority and the military fired in several instances killing many people. These

incidents continued till midnight without stop. The military report says:

> No sooner was one district reduced to comparative quiet by the presence of troops, than fresh riots broke out beyond the spheres of existing patrols; and as darkness came on, the difficulty of watching long lines of streets with innumerable intersecting gullies increased enormously. It was felt, therefore, that the force employed was insufficient, and urgent orders were despatched to Colaba for four field guns and the loyal North Lancashire Regiment to parade at once and proceed to Paydhuni.[70]

This was on the first day. The second day, that is, Saturday, August 12, brought the mill workers into the vortex of the riot. Though they were influenced by cow-protection propaganda and the Prabhas Pattan riot, the immediate cause of their participation seemed to be the riot in Bombay itself. On Saturday, the workers left their mills and threw stones at other mills to bring other workers out. This way, after sometime, all the mills were closed and more than one lakh workers were on the street. The majority being Maratha Hindus, they naturally took the side of the Hindus and started attacking and killing the Muslims. They did not pay the least heed to the persuasion of their employers to remain at work and dispersed in most of the northern parts of the city. While many of them were "carrying generally pieces of firewood, and attacked the Musalmans at Chinchpokli, Arthur and Parel Roads, Siwri, Mazagaon and the vicinity, killing and wounding many",[71] some of them went towards Mama Hajani, a mosque very sacred to the Muslims, situated on the rocks surrounded by water. They attacked the people inside the mosque with stones and "brought down a portion of it by means of thick long bamboo sticks."[72]

On this day, most of the northern area were ruled by the workers. The *Times of India* reports:

> Early in the morning at about 8 o'clock, they (the mill workers) took possession of the whole of the Girgaum Road, the Girgaum Block Road, and their adjacent localities, and ran about like mad fanatics, raving and carrying out "*Mahadev Ki Jeh*", and belabouring, and in some cases murdering stray Muhammadans who happened to meet them in the streets. They attacked every shop owned by Muhammadans in these localities, and robbed and plundered right and left . . . A strong party of mill-hands then attacked the mosque of the Borees in a by-lane called Mangalwady on the main Girgaum Road, and having brought out the doors and windows and furnitures, including even the cooking pots, of the mosque into the street, set fire to them, causing a great panic to the inhabitants of the locality.[73]

When confronted by the police or military, the workers sometimes fought and at other times laid down their sticks only to pick them up after the withdrawal of the military. In one instance, being cornered by the military, a large body of mill workers laid down their sticks and bludgeons. But as soon a the military withdrew, they picked them up and attacked the Pathans in a neighbouring locality.[74]

These workers roamed around the railway lines attacking the Muslim employees at the stations and desecrating mosques on the roads leading to Dadar, and at other places in the northern parts of the city. They conducted these operations with much cleverness. The authorities found it hard to check them "for the rioters having learnt where the military and police guards were stationed, took advantage of this to select isolated spots for their operations and proceeded to murder and plunder such victims as they could find. The police and troops were frequently unable to reach such places for some time; and the marauders were thus able to carry out their nefarious intentions with comparative impunity".[75] In one instance, when information was received that the workers "had attacked the Masjid situated in the compound of a bungalow known as the Nawab of Beyla's house, now in the occupation of Mr Haji Cassum,[76] and a strong body of police was despatched for the arrest of the offenders. Before the police could get to the place, the mosuqe had been desecrated, and the *Koran* and other religious books and several odds and ends that were within the building were torn or broken to pieces."[77]

Though, on Saturday, the field was held by the Hindus, the Muslims were not far behind. In fact, in the early morning "a large band of Julahas, issuing from Madanpura, Ripon Road with old knives, nails, razors and other weapon tied on the end of sticks, crossed the flats beyond the Byculla club, and severely injured a number of Hindus". They also created trouble at Duncan Road and Khoja Street, and "at the junction of Don Tad and Paydhuni Roads they were throwing stones from three sides".[78] In another instance, a Muslim burial party, consisting of three to four thousand men, turned violent and was fired upon by the military "killing half a dozen and wounding about forty or fifty".[79] In yet another instance, the Julahas and others, in an attempt to rescue the arrested were fired upon and one got killed.[80] In Khetwady and Girgaum, some of the Hindu temples were wrecked, in Arthur Crawford Market Hindu shopkeepers were attacked and at the Jackeria Masjid, the police and military were attacked in which one policeman got killed; two Hindu temples at Durga Devi and Falkland Road were destroyed.[81]

At several places, both parties were engaged in desperate fightings. In Chinchpokly, "a free fight had taken place between the two rival factions . . . and there were eight men killed and about a hundred seriously injured."[82] In Kamathipura and Northbrook Gardens "there were desperate contests between Kamathis and Julahas".[83] Several burial processions were attacked. In Islampura, a fight took place between the *Chalee Chores* and the Hindu residents of that area in which many of the former were 'mortally wounded'.[84]

The mill workers were very active in these riots. They not only went to some other areas to attack the Muslims but also attacked their Muslim fellow workers. In one instance, a whole row of chawl houses on Parel Road, the upper storeys of which were occupied by poor Muslims "had been forced into a state of siege by the Hindus all over the way, who armed with lathis, had come down in hundreds, driven the occupants into their quarters, and hurling volleys of stones at them forcing them to close every shutter and hopelessly stand a siege".[85] In another instance, many Muslim workers wanted to leave the mill areas and go to Nagpada which was dominated by Muslims and they had to be escorted by the police through besieging Hindu workers.[86] In another incident, one Abdul Aziz, carrying food for his relative at Kaiser-e-Hind Mill, was killed near the mill.[87] Such incidents were quite common. Not only were the Hindu mill workers attacking and killing their fellow Muslim workers, but Muslim *talimwallas* were attacking Hindu *talimwallas*, Julahas from UP were murdering their own Hindu countrymen and vice versa.

Loot was one main motive now induced into the riots. Property was looted from religious places, shops and private houses. Passers-by were also robbed and sometimes the loot became the principal motive transcending all the others. The police report says that so "little regard was felt by the *budmash* element for their religious principles . . . that the shops of both Musalman and Hindu were robbed by members of their own race and creed".[88]

On August 13, some Hindu mill workers learnt that some Muslims had been given protection by a Parsi at Girgaum Road. They went to the Parsi and demanded some money "threatening that if it was not given they would force their way into the place and murder him". On this the Parsi paid them ten rupees. After some time, another batch of workers came demanding the same. On being refused, they broke open the gate and entered the house, but finding nobody there, returned.[89]

On Sunday, the mills remained closed and the assault, loot and desecration were taking place in most of the mill areas. In Worli, Matunga, Parel, Mazagaon, Lalwady etc, hordes of workers could be seen going around doing 'mischief'.[90] At Curry Road "four Musalmans were killed".[91]

Although such incidents were still taking place, by the evening of the thirteenth Sunday, the worst was over. On the following day however, there were again some disturbances in Kamathipura. In Chinchpokly, a mill area, two Muslims were murdered and in Worli, another mill locality, two *dargahs* were desecrated and demolished.[92]

The mills remained closed on Monday, the fourteenth, because the workers refused

to attend as they feared that in their absence their families would be attacked.[93] They caused some trouble also in Parel, Elphinstone Road and Fergusson Road, but when the military arrived, they put down their sticks and went away.[94]

Even after a week since the beginning of the riot, the mill workers were refusing to join their work. It was only on Saturday, August 19, that most of them went to their mills. But even then they did not feel quite calm as false alarms kept sounding time and again. In one instance, "The Hindu mill-hands working in the mills at Kala Chowkey Road stopped work about midday on Saturday and turned out into the roads on hearing a report that the Muhammadans were coming to attack them. Having awaited outside the mills about 10 minutes, and being assured that it was a false alarm, they resumed work."[95]

Events took a more serious turn on Sunday, the twentieth, when again a false alarm was sounded at Pydhuni. This time the Hindus who had gathered to defend themselves did not go back even after learning that the alarm was false. They started attacking stray Muslims and it was only after the arrival of the military that they were dispersed.[96] A similar alarm was raised at Bhuleshwar, Chokshi Bazar and Bhoiwada and again several passers-by were attacked. A Musalman was attacked and injured near the Mulji Jaitha Market where he had gone to make some purchases.[97]

The situation was such that even after four weeks since the riots broke out, the police commissioner did not feel confident enough to conclude that "peace has been entirely restored".[98]

The actual rioting had taken place only on three days, but its intensity was such that 81 persons were killed, 700 injured and 1,550 arrested; 60 temples and 33 mosques were damaged or destroyed; property worth lakhs of rupees was looted and destroyed.[99]

The aftermath of the riot saw another development and that was the shifting of quarters. Right since the beginning of the riot, people had started moving to the areas where their co-religionists dominated. During the riot, the police and military had to escort them and such escort parties were attacked in many instances. If the people ventured to move without escort they were doubtlessly assaulted and wounded or killed. Even after the riot was over we find people moving to safer areas. The *Bombay Gazette* reported that "some Hindu residents in Bhendy Bazar and surrounding streets had brought labour-carts to their doors, and were preparing to remove their goods and chattels to Hindu quarters".[100] Such instances were frequent. Many people had started leaving Bombay, at least for the time being. It was reported that "at least about ten thousand people including women and children left Bombay on Wednesday".[101] The events and developments showed that the communal feelings and the fear psychosis arising therefrom were getting rooted in the mind of the populace.

IV

Conclusions

As in any other riot, the people who participated in this riot had a variety of motives. Though the cow-protection propaganda and the Prabhas Pattan riot might have started it, once the riot was on, it had a logic of its own. The feeling of communal revenge, of personal defence, of group rivalry and desire to loot kept it going on. In fact, the cow-protection propaganda could not have made so much impact on the Hindu mind because many of the participants like Mahars and Telugu Chamars were "not only cow-eating but cow carrion-eating".[102] As for the mill workers, even though they were Marathas, they had little time for this cow-protection propaganda.

Another significant fact was that some of the rioters on both sides were paid by their co-religionist patrons. The police report states that "the ten or fifteen pardeshis who were near the Bhuleshwar temple on Saturday, the second day of riot, and Sunday have been paid by the *shetias* on Saturday morning". The report adds: "I saw about 70 Maratha Ghatis loitering about in Kandewadi, they were very much agitated and all had sticks. I asked them whether they were paid, promised payments, but they bitterly complained about the *shetias,* and on Sunday some of Malvanis threatened Vizbookandass".[103] Similarly we find that "cart-loads of sweet-meats were supplied by wealthy Hindus to be distributed among their poor co-religionists... The Muhammadans also have been distributing *nans* and plantains to the poor of their community."[104]

However, payments made to instigate rioting were not very common. Only in a few instances the rioters were paid, but in most others they participated on their own. Loot, mostly though not invariably, on communal lines was a stronger motive. But even looting did not form the primary motive on the whole. The desecration and destruction of small temples and *dargahs* were not motivated by the desire of loot.

The defensive reaction, though very prominent, could not account for the attacks committed either by the mill workers or by other groups. Going around murdering people could not be said to have been derived from the desire to defend themselves.

So, the conclusion which presents itself is that though a variety of motives went into the making of the riots, the lines between 'we' and 'they' were drawn along communal lines. All the other motives and identities tended to get dissolved into communal identities at that point of time. Caste, class, occupation and region were subordinated to the communal identity.

However, this was only for the time being. The relative proportion of Muslims in the Hindu-dominated areas or the Hindus in the Muslim-dominated areas did not show a major decline over the years, despite a few migrations. Similarly, we find other loyalties taking over when the Sunnis attacked the Bohras in 1904 and the Julahas in 1908 during the Muharrum, or in 1911, on Muharrum day when Muslims and Hindus fought together against the police.

In police firing seven Hindus were killed and many injured along with the Muslims.[105] Among mill workers also Hindus started working and living amicably with the Muslims, even though immediately after the riot they had forced some of the millowners "to dispense with the services of most of their Musalman employees".[106]

Notes

[I wish to thank S Bhattacharya for his comments on earlier drafts of this paper.]

1 Dipesh Chakrabarty, 'Communal Riots and Labour: Bengal's Jute Mill-Hands in the 1890s' in *Past and Present*, No 91, May 1981, pp 140-49.

2 He says that "from the early 1890s onwards a communal culture grew in the northern parts of Calcutta and its northern suburbs, areas which had concentrations of immigrant merchants and labourers". In ibid, p 142.

3 For example, Ranajit Das Gupta, 'Material Conditions and Behavioural Aspects of Calcutta Working Class 1875-1899', *Occasional Paper No 22*, Centre for Studies in Social Sciences, Calcutta. Also 'Some Aspects of Labour History of Bengal in the Nineteenth Century: Two Views', *Occasional Paper No 40*, Centre for Studies in Social Sciences, Calcutta, for Dipesh Chakrabarty's Rejoinder and Ranajit Das Gupta's reply.

4 S Bhattacharya, 'Labour and Capital in Bombay City, 1928-29' in *Economic and Political Weekly*, October 1981, Nos 42-43.

5 In the following account I shall use the term Hindu and Muslim. It is not because these identities are exclusively and permanently valid; they could never be. The people had several identities, e g, Marathas, Kamathis, Bhayyas, Seedis, Pathans, Julahas, mill workers, dock labourers, etc. These terms are also not used as academically convenient categories; that would be presumptuous. But at that moment, during the riots, all identities tended to get dissolved into two forms—Hindus and Muslims, i e, along communal lines It is in this sense that the use of these terms are justified.

6 *Census of India,* 1921, Cities of Bombay Presidency, pt I, p 14.

7 Calculated from various Census Reports of Bombay City.

8 Jim Masselos, 'Power in the Bombay 'Mohalla', 1904-15: An Initial Exploration into the World of the Indian Urban Muslim' in *South Asia*, 1976, Vol VI:

Three of the nine circles in Chakala in 1901, for example, had very low Muslim percentages of 7.8, 16.2, 23.0, while the other six had very high percentages ranging from 99.8, 93.2, 87.8, 68.1 down to

63.6. Even allowing for probable inaccuracies in census data, there were thus extremely heavy concentrations in these four sections which, combined with circles 3 and 9 of Mandvi and circles 4 and 5 of Bhuleshwar, may be said to constitute the Muslim quarter of the city, p 77.

9 *Census*, 1921, op cit, p 5.

10 Calculated from various census reports on Bombay city. Comparable figures for 1891 are not available.

11 Morris D Morris, *The Emergence of an Industrial Labour Force in India: A Study of the Bombay Cotton Mills, 1854-1947*, Bombay, 1965, p 79.

12 Computed from censuses. Comparable figures for 1891 and 1901 are not available.

The Gazetteer, op cit, p 226, says that "of the mill operative population about three-quarters are Hindus". These figures are impressionistic and not based on any data. There are, however, another piece of evidence which supports my statistical conclusion. Morris, quoting a BMOA survey in 1940, says that "Muslims, the only other large group distinguished, made up 5.2 per cent of total mill workers" (Morris, op cit, p 75). This figure is almost equal to the above figure for 1921 for all the workers.

NOTES ANNEXED TO AND FORMING PART OF THE ACCOUNTS OF THE INDIAN BRANCHES FOR THE PERIOD JANUARY 1, 1988 TO MARCH 31, 1989

1 The total gratuity liability in respect of the entitled employees as at March 31, 1989 to be discharged in future in accordance with the Payment of Gratuity Act and the Bank's Rules is estimated on the basis of actuarial valuation at Rs. 23,438,000 (previous year Rs. 12,511,000) which taking into account the estimated tax benefit works out to Rs. 8,203,300 (previous year Rs. 4,378,850) in respect of which provision of Rs. 5,382,271 (previous year Rs. 3,522,270) is held in the accounts.

2 The total liability as at March 31, 1989 to be discharged in future under the Bank's Pension and Voluntary Retirement Plans introduced in earlier years as determined by actuary is Rs. 425,013 (previous year Rs. 1,201,942) which taking into account the estimated tax benefit works out to Rs. 148,755 (previous year Rs. 420,679) which will be accounted for on a cash basis.

3 The Bank has retained in the Reserve Fund Account Rs. 155,930,700 representing Deposits for Premises taken on lease as per the Reserve Bank of India's guidelines. This amount has been retained with the approval of Reserve Bank of India out of the approved remittable surplus of earlier years.

4 The value of computers etc. used in the Indian business as of March 31, 1989 gifted in earlier years by the Banks' Head Office has been transferred during the period and shown as additions to Fixed Assets with a cor-

by Rs. 13,52,78,123, interest accrued on investments has decreased by Rs. 17,29,57,236 and profit after tax for the period has reduced by Rs. 1,31,87,690.

6. Sundry Accounts under the head "Other Liabilities" and "Other Assets" include amounts pending transfer to appropriate accounts.

7. Bills received from constituents for collection on their behalf are controlled through memorandum registers and are recorded in financial ledgers only when collected. These bills for collection outstanding as on March 31, 1989 have, however, been shown in the Balance Sheet under the relevant heads of account.

8. Bank's own Assets and Liabilities in foreign currencies are converted at the rates ruling at the year end and forward exchange contracts are reflected at contracted rates.

9. By the Companies Act, 1956, the Bank is exempt from disclosing matters not required to be included by the Banking Regulation Act, 1949 and these accounts have been prepared accordingly.

10. Previous year's figures have been regrouped wherever necessary. Current year's figures are for a period of fifteen months and hence not comparable with the previous year.

Education and Communal Politics in Benga

A Case Study

Poromesh Acharya

The relation between educational development and communal politics in Bengal during the 30s and 40s o this century is a fascinating subject which has not received the attention it deserves from scholars of either Benga politics or development of education in Bengal. Communal politics in Bengal has been generally studied fron the standpoint of land relations as an expression of land politics. This approach, while certainly not invalid, onl partially explains the problem of communalism in Bengal. Communal differentiation as rooted in the realm o cultural identity remains still an autonomous reality which needs to be taken into account particularly in dealin with issues like education. Against this background, this paper deals with the communal tensions generated b the introduction of the Bengal Secondary Education Bill, 1940, in the Bengal legislative assembly during the perioc of provincial autonomy.

I

THIS paper deals with the communal controversy and tension that overshadowed the political and social life of Bengal with the introduction of Bengal Secondary Education Bill, 1940, in the Bengal Legislative Assembly, during the period of provincial autonomy. The paper does not intend to deal with the problems of theorising communalism as such. Yet it may provide some insights into the problem.

The relation between educational development and communal politics in Bengal during 30s and 40s in the present century makes a fascinating study. This aspect, it appears, has not as yet received the due attention of scholars who have dealt with Bengal politics or development of education in Bengal. Communal politics in Bengal has been generally studied from the standpoint of land relations as an expression of land politics. Admitting the validity of this approach it can safely be said that this only partially explains the problems of communalism in Bengal. Communal confrontation cutting across the class structure is sometimes seen as the politics of manoeuvre due to the inner contradictions of the dominant classes. Communal differentiation as rooted in the realm of cultural identity remains still an autonomous reality which need to be taken into account particularly in dealing with issues like education. In fact, the history of education in India shows that education, even after the introduction of western education, was never a culture-neutral education.

It is interesting to note that the denial of this reality by the nationalists gave rise to the communal politics of education in Bengal during the first half of the present century. It is all the more interesting that nationalism in Bengal showed clearly Hindu moorings and developed on the basis of Hindu cultural identity in spite of all claims of nationalism as a secular ideology.[1] It was no wonder that Moslem intelligentsia in Bengal did not find much difference between Congress nationalists and Hindu nationalists. In fact, the only difference was that while Hindu nationalists consciously interpreted Indian nationalism in terms of Hinduism, Congress nationalists tried to interpret Hindu nationalism as a secular ideology. It was easy for the caste Hindus of Bengal to resolve the question of their Indian identity through Hinduism. But for Bengali Moslems it was a crisis.

The crisis of Bengali Moslems can be traced back to the last century when modern Bengali language, literature and system of education were being shaped by the stalwarts of the caste Hindu community variously known also as rationalists, or radicals or liberals. Obviously, a Hindu bias crept in and a feeling of alienation grew among the educated Moslems in Bengal. Bengali Moslems rejected the *dobhasi* literature and refused to accept Sanskritised or Hinduised Bengali. The Bengal government took note of it and in a letter in 1872, to the government of India wrote, "It is certain that they would have no desire to be instructed in an artificial Sanskritised Bengalee such as some Bengalee scholars effect".[2] Some *asraf* or higher caste Moslems in urban areas prescribed Urdu as the medium of instruction for Moslems in Bengal. But that was not acceptable to Bengali Moslems in general.[3] However, with the rise of nationalist movement this crisis of Bengali Moslems aggravated. Failing to find a Moslem idiom of Indian identity Bengali Moslems gradually took recourse to pan-Islamism.[4] As a matter of fact, they were rather pushed to such a situation by the denial of the nationalists of the cultural roots of communal differentiation.

Bengali Moslems, however, could not resolve their crisis by taking recourse to pan-Islamism and accepting Pakistan. It was only after the formation of Bangladesh that the problem could be somewhat resolved. But that is another story beyond our topic of discussion.

II

By the turn of the century Moslem public opinion became vocal against the Hindu domination over the system of education. They, at the same time blamed themselv for not taking the initiative but leaving it Hindus to shape the system of educatio They, however, identified three major pr blems of education. These were: (i) langua problem, (ii) problems of religious educ tion, and (iii) Hindu bias in the existi education. The government of India in letter to the secretary to the government Bengal stated, "The reasons which ha retarded the spread of secondary educatio among the Muhammadans are the pover of the community, the linguistic difficult the demand for religious instruction an want of Muhammadan representative on the governing bodies of education institutions".[5]

In the year 1915 the Bengal governme constituted a committee to consider que tions connected with Muhammadan educ tion. As a general policy the committe recommended that "while it is necessary maintain special institutions for Moslems is undesirable to develop further a syste of education for this community separa from that of other communities. Th existing system should be carefully examine to see where they fail to satisfy members o the community and necessary modificatio should be introduced".[6] The committee fu ther recommended that "the adequat representation of Moslems on the manag ing committees of high schools should b made a condition of receiving grant-in-ai from the public fund" and that "the univer sity should insist on the adequate represen tative of Moslems on the managing commit tee, before granting recognition to any nev school".[7] It also recommended that, in al government schools 15 per cent of the place be reserved for Moslem boys. There shoul be more Moslem headmasters and assistan teachers and adequate provision shoulc be made for Arabic, Persian and Urd teaching.[8]

It appears that the committee could no resolve the problem of language study to the satisfaction of all. It recognised that 'Bengal must be the medium of instruction' in primary 'schools attended by children whose

nacular is Bengali'.[9] At the same time it that 'Muhammadan boys should have opportunity of learning the elements of du to facilitate their study of the ran.[10] For the secondary level they sug- ted a three language formula of English, ngali and Urdu. It stated "we have care- ly examined this question of languages to whether the number of languages can- t be curtailed, and the general conclusion which we arrived was that only one of the ee languages (Persian, Arabic and Urdu) ed necessarily be studied thoroughly".[11] may be noted that this emphasis on Urdu s not without reason. According to the mmittee, "Urdu is a language which is not ly spoken by the Moslems of other parts India but has also come to be regarded the *Lingua-franca* of the whole coun- y".[12] In fact by introducing Urdu, Bengali oslems wanted to resolve their problem of dian identity.

The Calcutta University Commission 17-1919 also considered the problems of ucation of Bengali Moslems. The Com- ission received several Moslem deputations d summarised some of their grievances. few revealing grievances were as follows:

a) 'the encouragement by the university of Sanskritised Bengali, which is difficult for usalmans to acquire'.

b) 'the use by the university of books hich are either uncongenial to Musalmans being steeped in Hindu religion and tradi- on, or even positively objectionable to em, because they contain statements of- nsive to Muslim sentiment.' Elphinstone's istory of India is cited as a case in point,

(c) The requirement that each candidate hould write his name, instead of giving a umber, on the answer books shown up at niversity examinations. (It is suggested that is practice operates to the prejudice of loslem candidates) and,

(d) It was alleged that 'out of 895 xaminers appointed by the Calcutta Univer- ity in 1917 in subjects other than Urdu, ersian or Arabic, nine only were Musalmans'. As such they demanded 'fair hare' in the appointment of university xaminers.[13]

The claim for 'fair share' in educational management became the main issue during he period of diarchy. Hartog observed, "the ransfer of the Department of Education to opular control, as represented by a minister, oth increased the public interest in it and made it more sensitive to the currents of ublic needs and public opinion. Muham- madan community particularly had wakened to the need and possibilities of education".[14] In fact, during the period of diarchy certain concrete measures were taken for the extension of primary education in Bengal. A centralised and uniform system of primary education was being introduced n Bengal for the first time. As a result primary education made a certain degree of progress. Interestingly, Moslems formed nearly 54 per cent of the total roll strength, and the Hindus and other communities together formed 46 per cent. Moslems, however, were still lagging far behind in secondary and higher education. They strongly believed that the Hindu bias in the present system was a major if not main, hindrance to their education. And to change it they need to achieve some control over the system of education.

There was a very strong resentment among Bengali Moslems against the prescribed text-books and the Sanskritised Bengali language. The Report of Dacca University Committee stated in this regard that "Bengali literature as at present permeated mainly by Hindu ideas, and there is a great paucity of literature on subjects derived from authentic Arabic or Persian sources such as will interest Muhammadan students". It suggested that "the government or the university should encourage authors to publish Bengali books of a Muhammadan character, and that such book should be included in the works prescribed as models of style".[15] An analysis of the Moslem public opinion as reflected in journals edited by Bengali Moslems will show the depth of this resentment. It was even alleged that books authored by Moslems were not selected, as the text-book selection committees were dominated by the Hindus.[16] Abul Monsur Ahmed, a writer and a political leader of repute, alleged that one Hindu publisher refused to print has book as he used the word *pani* instead of *jal*, meaning water. He also alleged that his book *Naya Para* was not approved by the text-book selection committee on the ground of too many Arabic and Persian words. It happened when Fazlul Huq was the education minister.[17]

Azizul Huq, vice-chancellor of Calcutta University and the speaker of Bengal Legislative Assembly in his note to Kamal Yar Jung Education Committee wrote, "with the beginning of the new reaction Bengali of the fifties and sixties of the last century contained such stiff Sanskritised words and phrases that it is doubtful, if any average Bengali, unless he is a good Sanskrit scholar, can even understand them. No doubt the language has thereafter been liquified to some extent in process of time. But it still contains many hard Sanskrit words specially in some of the school and college textbook... It is with this inherent disadvantage that the Musalman student has also to join the present system of education. But he has also to contend against the syllabuses, schemes of study and text-books. He reads literature and he becomes conversant with *Dev, Devi, Avtar, Namaskar, Puja,* the conception of life, birth and rebirth, the pantheon with all the doctrines of *Veda* and *Vedanta, Purans* and *Gita*... He hardly comes across the conception of *Allah, Rasul,* or the meaning and import of *Namaz, Haj, Zakat* or the principles and doctrines of Islam in Quran or Hadis." In regards to history text-books he writes, "He reads ancient India as a study of culture in a picture of its inspiration and ideals... Coming to the medieval period he immediately falls into a narration of wars and conquest, slaughter and carnage, destruction and demolition of India's past, amidst patricidal and fratricidal struggles and disputes..." He concludes, "Let it be remembered that this is what a student in the most formaltive period of his life has to read in a school. It is bound to create communal discord and deep-rooted hatred. No wonder the Muslim culture and social order have disintegrated under this system of education and India has not yet been able to solve the Hindu-Muslim problem." Azizul Haq surmised that, "The consensus of opinion among educationists is that there are two and only two alternatives. Either the present system of schools and university studies must have such syllabuses and themes that the Hindus, the Muslims and all other creeds and communities can meet on an essentially common platform with no influence, tendency or bias in favour of the one or the other or, educational India must be a federation of two or more types of educational organisations, each trying to develop its own culture and heredity, but in a spirit of catholicity and goodwill to others. I hope and pray that wisdom and sense will still prevail and there will be a common and unified plan and programme of education."[18]

We could not help quoting him elaborately as he represented the comparatively liberal section of Bengali Moslem middle class. Opinions of Bengali Moslems, particularly liberal Moslems like Azizul Huq and Fazlul Haq, one time premier of Bengal, in regard to the Wardha scheme or basic education may be revealing. Both of them and Bengali Moslems in general rejected the scheme.[19] They were doubtful, like their Hindu counterparts in Bengal, in regard to certain aspects like self-supporting nature and the role of *Takli* and *Charkha* as was proposed in the scheme. But the main objection of the Bengali Moslems, it appears, was that the schools under the scheme would turn into *Ashram-schools* like *Vidya Mandir* and preach Hinduised Congress cult in the form of *Bharatmata, Bande Mataram,* non-violence and Gandhi cap.[20] It was also feared that a reformed Hindusthani would be forced upon Moslems and thus would drive out Urdu. Azizul Haq wrote, "There was genuine misapprehension that this new teaching would inevitably lead to inculcating the same brand of 'nationalism' with which India has been too familiar today in some of the 'nationalist' newspaper."[21] It may be noted that not only the scheme but bona fide of those who would be entrusted to implement the scheme was also in question.

It is apparent that Moslem leaders of Bengal were apprehensive of the design of the nationalists. This apprehension of the Moslems of Bengal was however, not totally unfounded. A distinct Hindu bias was quite observable in the attitudes and activities of the nationalists in regard to different vital issues during the period of diarchy and provincial autonomy. The Bengal Secondary Education Bill, 1940, was one such issue and

perhaps the most significant one. Before we come to our main topic it may be necessary to say a few words about the Hindu mind of the time particularly, how *Hindutwa* was defined by Hindu nationalists.

III

The first Hindu Sabha which was established in Punjab in the year 1907, stated its object thus: to promote brotherly feelings amongst the various sections of the Hindu community and to improve moral, intellectual and material conditions of the Hindu.[22] When the Hindu Mahasabha was organised on an all-India basis it became necessary to define Hindu and *Hindutwa*. Hindu Mahasabha maintained that "it was not a religious organisation. *Hindutwa* or Hinduness which included Arya, Brahmo, Buddhists and Jain, was not a religion but a nationality. *Hindutwa* did not depend on particular spiritual belief or system of philosophy. Before the advent of the Muslims and Christians all Hindu secular institutions, traditions and customs were Hindu because they were Hindustani or Indian."[23] By implication Moslems and Christians were excluded as they had denationalised themselves by accepting a foreign or non Hindu creed culturally. The All India Hindu Mahasabha in its 21st session in Calcutta defined a Hindu thus: "Every person is a Hindu who regards and owns this ***Bharat Bhumi***, i e, land of the origin of his religion, the cradle of his faith."[24] Earlier in its 20th session Hindu Mahasabha declared that "Hindi that is based on and drawing its nourishment from Sanskrit vocabulary is and rightfully deserves to be the national language and Devnagri as the national script of Hindusthan".[25] In its 21st session the Mahasabha announced that, "it is our bounden duty to oust out as ruthlessly all unnecessary alien words whether Arabian or English from every Hindu tongue—whether provincial or dialectical".[26] As an example they cited the Bengali language and said, "Our Hindu brethren in Bengal are especially to be congratulated upon in this connection because the Bengali literature is admirably free from any such uncleaned admixture of unnecessary alien words which cannot be said regarding our other provincial tongue and literature."[27] Hindu Mahasabha wanted a *'Sanskrit nistha'* Hindi as it is in vogue now. In Bengal this process was almost complete in the 19th century by the grace of caste Hindu stalwarts like Iswar Chandra Vidyasagar, Bhudev Mukhopadhya and Bankim Chandra Chattopadhya. Bhudev Mukhopadhya was, also in a way, responsible for introducing Hindi in the education system of Bihar. Even 'A Plea for The People's Tongue' by no less a person than George A Grierson, the linguist, could not restore Behari dialects as medium of instruction.[28] And thus Bihar was also included in the Hindi belt.

It is also a fact that modern Bengali literature developed in the wake of Hindu religious revivalism in the second half of the last century. The ethos of Hindu revivalism was best expressed in the writing of Bhudev Mukhopadhya, Ramesh Chandra Dutta and above all Bankim Chandra Chattopadhya. All of them wrote novels in historical settings with Moslem characters. Moslem characters generally appeared, with few exceptions like Osman Khan in *Durgesh Nandini*, as degenerate and inferior. Even it was alleged that historical events were wrongly portrayed to glorify Hindus and undermine Moslem characters.[29] There is no doubt that Moslem sentiment was seriously hurt.[30] The authors, however, were inspired by nationalist spirit. This identification of nationalism with Hindu glory made it difficult for Moslems to accept Indian nationalism as a secular ideology.

Absence of the Moslem world in the Bengal literature of the latter period is perhaps more significant. The voice of silence is louder. One may go through the entire literature by Rabindranath Tagore and Sarat Chandra Chattopadhya, the two greatest authors of this period, yet may not get a glimpse of the truthful Moslem world. Here and there may be a few stray characters looked from a distance. The only exception may be a short story *Mahesh* by Sarat Chandra Chattopadhya. It only shows the lack of interest on the part of Hindu intelligentsia to know intimately the world of the majority community.[31] This exclusive character of the Hindu community of Bengal is also clearly reflected in their attitudes towards the issues of education. An examination of the educational ideals developed by educationists and nationalists in Bengal, who were predominantly Hindus, will show the Hindu orientation of their mind. It was no wonder that Tagore's Santiniketan *ashram* was also not free from that bias in spite of his international outlook. Moslem response as a result, could not be very kind. This was how the stage was set on which the drama of the Bengal Secondary Education Bill, 1940, was enacted.

IV

On August 21, 1940, the premier of Bengal A K Fazlul Huq, who also held the education portfolio, introduced The Bengal Secondary Education Bill, 1940 in the Bengal Legislative Assembly to provide for "the regulation and control of secondary education in Bengal" and moved that the bill be referred to a select committee of twelve members which should submit its report by November 30, 1940. He had proposed to include in the select committee leaders of all the different opposition groups like Syamaprasad Mookerjee, Harendra Nath Choudhuri, Pramatha Nath Banerjee, Kiran Sankar Roy and Atul Chandra Sen. But as they refused to serve on the select committee he proposed a committee of 12 members including only representatives of different groups which formed the coalition ministry. In his introductory speech he claimed that the bill was not a hurried piece of leg[islation] undertaken in order to transfer p[ower] from one body to another meaning Calc[utta] University to a Board of Secondary Ed[uca]tion, or designed as a political measure, [but] a measure to ensure educational reforms [which] had long been needed and the urgency [of] which had been stressed by educationists [for] over twenty years.[32] But the bill caused [un]precedented communal tension and [the] legislature was divided in clear Hin[du-] Moslem division. The only other bill [that] was bitterly fought on communal grou[nds] was the 'Calcutta Municipal Amendm[ent] Bill, 1939'.

The idea of a separate Board of Sec[on]dary and Intermediate Education [was] mooted in the Report of Calcutta Univer[sity] Commission 1917-1919.[33] In 1923 gove[rn]ment prepared a bill proposing establi[sh]ment of a Board for Secondary Educati[on] and sent it to the Calcutta University for o[pi]nion. The university rejected the bill on [the] ground that it proposed "absolute cont[rol] of the local government" over the "wh[ole] organisation relating to secondary edu[ca]tion".[34] A tussle ensued and continued [till] 1937, between the government and [the] Calcutta University mainly on the issue [of] control of the proposed board. Both sid[es] made several proposals in successive yea[rs] till 1937. Calcutta University maintain[ed] that the Board of Secondary Education, [if] established, should be under general sup[er]vision of the senate or be a constituent bo[dy] of the university to look after seconda[ry] education.[35] Government, on t[he] otherhand, was agreeable to concede certa[in] consultative power to the university b[ut] would retain ultimate control over the boar[d]. But in 1937 the question of commun[al] representation came to the forefront and th[e] entire issue took a communal turn as th[e] revised bill was sent to the university for i[ts] opinion.

In 1937, N A Jenkin, an officer of th[e] education department drafted a bill for "th[e] establishment of a statutory board for th[e] regulation and control of secondary educa[tion] tion in Bengal". The government of Benga[l] sent the bill to the Calcutta University "fo[r] the views of the university". This bill stirre[d] the Hindu public opinion and made it [a] public issue presumably for the communa[l] safeguards included in it. The Calcutt[a] University syndicate appointed a committe[e] to consider the bill and submit a repor[t]. Meanwhile, the government withdrew the bi[ll] in June and in November sent a revised bil[l] to the university. The committee considere[d] the revised bill and gave its report o[n] December 1937. It opposed "the establish[ment] ment of a board that will be in effect an ele[ment] ment in secretariat administration" and sup[ported] ported the "establishment of a Board o[f] Secondary Education under the general con[trol] trol of the senate". In the opinion of th[e] committee the bill "is not a sound educa[tional] tional measure". It opposed the "communa[l] representation as embodied in the bill" an[d]

maintained, "As a university we are against communal representation as such. We look upon this part of the bill with considerable anxiety and disfavour. We believe that while framing the scheme proper representation of the educational interests of all communities can be secured without making statutory provision for representation on a communal basis."[36] It is interesting that till 1937 Calcutta University did not raise any objection against communal representation though there was provision for it in the previous bills also. It may be noted that in 1926 there was provision for only 14 per cent Moslem representation. In the 1937 draft, it was increased to 17 per cent, while in the revised bill, 41 per cent of the seats were reserved for Moslems. It may also be noted that in Bengal at that time, of the total population, nearly 54 per cent were Moslems and Hindus and others constituted only 46 per cent. In the Bengal Legislative Assembly though no political party had an absolute majority, Moslems constituted the overwhelming majority. As such Moslem domination in the ministry was a settled fact. On the other hand, Calcutta University was overwhelmingly dominated by Hindus. In such a situation control over the board by either party was likely to have a communal overtone. Besides, considering the grievances by Moslem deputationists to the Calcutta University commission and the opinions as reflected in the journals edited by Moslems it can reasonably be concluded that Moslems in general, believed Calcutta University to be biased in favour of Hindus. There is no doubt the issue of secondary board turned into a communal issue even before the introduction of The Bengal Secondary Education Bill, 1940 in the legislature.

In 1938 a conference was called to resolve the differences of opinion but without any result. The Bengal government however, could not move a bill in the Bengal legislature dealing with secondary education without amending Calcutta University Act, 1904, which vested the power of controlling matriculation examination in Bengal, Assam and other areas outside Bengal with the university. Besides, the Bengal legislature had no legislative jurisdiction over Calcutta University. The Government of India Act 1935 was also required to be amended to bring Calcutta University under the legislative control of the Bengal legislature. The Bengal government now moved the central government for necessary amendments. A resolution adopted by the Calcutta University senate on December 12, 1936 made the job easy for the government. The resolution stated, "the senate is of opinion that the Calcutta University should be treated as provincial subject. If however, there are serious difficulties regarding the position of Assam, then only with regard to future legislation affecting the university, the federal legislature may be given the necessary jurisdiction."[37] It took some time to make the necessary amendments and from April 1, 1940 the Bengal legislature was vested with the legislative power over the Calcutta University.

A K Fazlul Huq, while introducing the Bengal Secondary Education Bill, 1940, stated, "the bill proposes to establish a large Board of Secondary Education to regulate and control secondary education. Secondary education embraces all education other than primary or university. Education in *madrassas* and middle schools is thus included as well as education in high school."[38] The bill proposed to constitute a board with 50 members of whom 25 were to be either ex-officio or nominated while the rest were to be elected by different electorates like Calcutta University, Dacca University, Legislative Assembly, Legislative Council, headmasters, headmistresses, head of madrassas and members of the provincial board of Anglo-Indian and European Education. Excluding the president who would be appointed by the government, there were 49 members of whom 22 were to be Hindus, 20 Moslems and 7 Europeans. Of the total 50 members at least 22 would be directly related to education while a number of others were likely to be indirectly related to education.

The executive power of the board was however vested on an executive council of 14 members to be constituted by the board. Of the 14 members, 6 were to be ex-officio members. They were the president of the board, the two vice-chancellors, the director of public instruction, the assistant director of public instruction for Moslem education, the deputy directress of public instruction for female education. The remaining 8 members were to be elected by the members of the board, of whom 2 would be inspectors of schools, 3 Calcutta University members of the board, 2 Dacca University members of the board, 1 scheduled caste member of the board. The president of the board would be the chairman of the council.[39] It may be noted that in the council, excluding the president there would be 6 Hindus, 5 Moslems, 1 European and the other one uncertain but likely to be a Hindu.

It is apparent that Moslems were not to be in the majority either in the board or in the council even if the president be a Moslem. There was however, provision for communal representation. Considering the political situation of the time and the Moslem perception about educational management in general and Calcutta University in particular such a measure perhaps was unavoidable. In fact, W C Wordsworth supported the motion on this ground though he did not like communal representation. He said, "I would seriously, with all the seriousness I can command, ask the House to consider whether the opposition to communalism may not sometimes take a form as dangerous and unpleasant as communalism itself." The opposition, however, was not in a mental state to listen to his advice.[40]

Fazlul Huq maintained, "Is this justice? It may be but it is not to the Hindu community. We might on a population distribution basis have demanded more seats for the Muslims, but we have tried to be fair and have given weightage to the Hindus because of their past achievements in educational spheres. As far as the provisions for Hindu, Muslim and European interests are concerned, therefore, there can, I think, be no justified criticism of our proposals. Criticisms can come only from those who are determined at all costs to retain the controlling influence in the hands of one community only."[41] He announced three fundamental principles as the basis of this bill and on which the government was not prepared to yield. They were: (i) "the presence on the board of adequate representation of the various communities must be guaranteed"; (ii) "the board must be largely autonomous and have complete control of all secondary school activities"; and (iii) "such ultimate control over the board's activities as is necessary must be exercised by government."[42] At the same time he assured, "assuming the acceptance of these principles, we are prepared to listen to criticism of the details and other aspects of the bill and to ensure that before the select committee starts its deliberations, an opportunity will be given to the universities to make such recommendations about the bill as they think fit".[43]

What appears from the debate that ensued is that the government control over the secondary education and the communal representation as was proposed in the bill, were the two main objections which prevented the leaders of different opposition groups to participate in the select committee and prompted them to fight it as bitterly inside as outside the legislature. It is quite apparent that the other points they raised in course of their deliberations could easily be taken care of in the select committee itself. In fact, Fazlul Huq and the other leaders were meeting outside the legislature to come to an agreement. An examination of the debates however will help us to understand better the different viewpoints and perceptions of the problem.

V

On behalf of Congress Party, Harendra Nath Rai Choudhury moved by way of amendment, that the bill be circulated for the purpose of eliciting public opinion. He argued that the secondary education system in Bengal was mainly a creation of private efforts and the bill was designed to establish official control over a non-official system. He stated, as their main grievance, "Our complaint is not so much that on the board or on the executive council they are going to have so many Muslim members or so many Hindu members, as that these are going to be definitely political bodies, and the whole of the non-government part of the secondary education in the province is going to be committed to the charge of a political body and not to the care of the educationists

of the province. That is our main grievance."[44] This was the typical stance taken by most other opposition leaders as if education was never a political issue nor it should be. However may it be denied by the nationalists, Moslems in general, believed Calcutta University to be a political body of the Hindus. And there was some truth in it. Nationalists also had some justification in taking such a stand. Since the time of Curzon, British government became suspicious of the private management of the secondary schools in Bengal. They considered the private schools to be the breeding ground of 'terrorist' politics and tried to control the spread of such schools.[45] Congress in Bengal as they were not in power like in other provinces of Hindu majority, refused to take note of the change that was effected by the installation of a representative government, however limited might be its power. Besides, in the core of their mind, as the nationalists were predominantly Hindus in Bengal, they felt somewhat threatened because of the communal award. But a long tradition of ostrichism did not allow them to see through the reality of the situation. It was no wonder that Choudhury proudly claimed himself a Congressite and as such non-communal yet could not help giving out his Hindu bias to a provocation from the coalition bench. He retorted claiming boastfully, "It is the caste Hindus who have built up by their life blood all these schools and you dare enquire what about the caste Hindus!"[46] At that Fazlur Rahman of Dacca remarked, 'At the cost of poor peasants of Bengal!' Choudhury replied, "Where do the poor peasants of Bengal come in? The schools are being run by the fees of the students and by voluntary contribution from private sources and not from any of the poor peasants of Bengal that do not receive their education in them."[47] Rahman commented, "Your income is derived from poor peasants."[48] It should be noted that poor peasants in Bengal were overwhelmingly Moslems and scheduled castes. And Harendra Nath Choudhury was the famous zamindar of Taki in the district of 24 Parganas.

Harendra Nath Choudhury's views deserve special notice not only because his was probably the soberest speech made on the occasion but he acted as the main spokesman of the Congress Party and became the minister of education after partition of Bengal when Bidhan Chnadra Roy took over as the chief minister. His book *The New Menace to High School Education in Bengal* written in 1935 may be considered to be the nationalist's response to the government's educational policy of the time. In this book he advocated in favour of private management of secondary education and cautioned against government policy of control on the plea of unplanned growth of secondary education in Bengal. His speech in the Assembly reflected the same trend of argument with the addition of an implicit communal undertone. His opposition to government control and his charge against the proposed board of Secondary Education as a political body on grounds of the predominance of official and nominated members becomes suspect when compared with his own performance as the minister of education after partition of Bengal. It was during his tenure as the minister of education the West Bengal Board of Secondary Education was first constituted. And it was constituted with so many officials and nominated members that the students of West Bengal steered a movement against the board demanding a democratically elected body.[49]

If Harendra Nath Choudhury's speech was implicitly communal, speeches by other opposition leaders including Atul Chandra Sen, Pramatha Nath Banerjee, Syamaprasad Mookherjee, Kiran Sankar Roy, Nalini Ranjan Sarkir and even Sarat Chandra Bose, were explicitly communal. The main purport of these speeches was to let it be known to the government that Hindus would resist the bill at any cost. It was clear from the speeches that official control was taken to be Moslem control over a system of education which was a contribution of Hindus. Often they argued against bringing in communalism in the arena of education without even mincing words bearing definite communal import and thus betraying their own communal feelings. They were trapped in their own communal emotion and their speeches only helped rousing the communal tension further.

Atul Chandra Sen's speech is a case in point. Characterising the bill as communal he said, "under the proposed constitution we will have government's own men, Pakistan-minded Muslims on the board". He announced, "if and when this obnoxious bill comes to be made into law, we shall know how to combat it as we did combat an executive fiat 35 years ago coming from a man much bigger than the hon'able education minister. If we could then unsettle 'a settled fact', we know that we can do it even today." H S Suhrawardy retorted, 'Not today'. Sen asserted, 'Yes, even today. Sir, I say that we can unsettle a settled fact even today." Even it was alleged by a member that, "the real object of the bill is to make all the secondary schools the training ground in ideas and theories which the communally minded ministry wants the youth of the country to hold".[50]

Kiran Sankar Roy alleged that the bill would introduce communalism into education, and said, "Out of the 1,400 schools 1,200 were established by Hindus, out of more than 3 lakh students reading in those schools less than 80,000 are Mahammadans". He equivocated that "he did not take pride for that but if pushed, then he should, though as a congressman he is not communal in outlook".[51] One can easily discern the communal overtone of his speech. Nalini Ranjan Sarkir also did not mince his words and called the bill 'communal' and 'not democratic' as it is communal.[52]

Syamaprasad Mookerjee was rather outspoken and showed no inhibition in holdin brief for Calcutta University and the Hind community. He maintained that the preser government, introduced several controversia legislative measures but "there has not bee any measure so vital as this to the largest in terests of the people of this province".[53] H alleged that, "the bill has introduced th communal principle in a most perniciou manner touching elaborately even the con stitution of bodies which will select publica tions and text-books and frame the syllabu and curriculum". He further alleged that "... mutilation of the Bengali language, distor tion of historical facts and flagrant disregard of academic standpoints are the charac teristic features of the work of the (govern ment reconstituted) text-book committee".[54] He reminded the government, "How can I forget that in this province today out of 1,500 high schools, barring a few, all owe their existence to Hindu support and influence...?"[55] He frankly declared that he opposed the bill fundamentally and would not accept even if it was passed by the assembly. As he was opposed to the bill fundamentally he did not join the select committee. He offered three options, namely, (i) to make a bill on purely educational considerations, (ii) to allow Hindus to go their own way with their separate education system or, (iii) to force this bill and face the Hindu opposition.[56] He threatened, "They admit of no compromise and we are ready for fighting this new menace. Its acceptance specially means to us the end of the Hindus and a cry must go forth to every Hindu child that is reading in educational institutions, to every Hindu guardian and to all others interested in the welfare of our people that if any self-respect is left in them, that if they are not to reduce themselves to a state of subservience in the field of culture as they have been reduced in the economic and political spheres, they must be prepared to face this organised campaign of opposition at any cost whatsoever." At this point his speech was loudly cheered from the Congress bench, particularly when he declared, "But let me say this, that minority though we are, it yet retains sufficient patriotism, courage and influence to stand boldly for the vindication of its just rights and it will consider no cause nobler and greater than the preservation of culture and education for which it would be prepared to face the most dire consequences, to sacrifice life and all before accepting as inevitable something that detests as unclean and unworthy..."[57]

In rhetoric and oratory no other political leader of the time except Fazlul Huq, probably could match Syamaprasad. And one can imagine the impact of his speech on the Hindu mind. In fact, he made such speeches, even harsher speeches in so many public meetings organised in different parts of the country. His speech in a meeting of teachers organised by Calcutta district committee of All Bengal Teachers Association was even referred by coalition members as an example of inciting communal temper, during the

assembly debate on the Select Committee Report in 1941. Before, discussing the response of the Hindu public let us also examine some of the speeches made by Moslem members of the legislature.

Abu Hossain Sarkar from Krishak Praja Party, who was known to be a nationalist, gave qualified support to the motion for sending the bill to a select committee. He countered the argument of nationalist Hindus regarding government control saying that the university was not a free institution and government had full control over it. He maintained that out of 110 members of the university excluding the chancellor and vice-chancellor, only 20 were elected while 10 were ex-officio and remaining 80 were appointed by the chancellor. He also alleged that the university compelled students to salute the union flag and sing 'God save the King'. He asked, "Did they teach us anything save and except 'England's Work in India' to insist love for imperialism, false story of Black Hole, Tarasundari and other things, stories of Rajput chivalry concocted by the British writers? Is this nationalism?" He reminded that C R Das rightly called the university *Golamkhana*. He further alleged that the university did not do anything to improve the lot of the school teachers who received Rs 20 to Rs 30 a month.[58] There is some truth in the allegation no doubt. However, it is apparent that the secondary bill became an issue of confrontation between Calcutta University and government of Bengal believed to be representing Hindu and Moslem causes respectively.

Syed Musta Gawsal Haque maintained that communalism had been used as a bogey by the opposition to subvert all the good legislative efforts of the government. He referred to the Bengal Tenancy legislation, Bengal Agricultural Debtor Act, the Money-lenders Bill and Calcutta Municipal Amendment Act and said that all these had been opposed on grounds of communalism but gave radical results. He observed that secondary education had been suffering from 'haphazard' and 'inefficient' management because of dual control of government and the university. He alleged that the university was allowed to make a good business out of the examination fees and sale of the text-books but it did not spend a single pice for the improvement of secondary schools.[59]

Syed Badradduza appealed not to be swayed by emotion. He opined that some government control was necessary and maintained that the constitution of the board as proposed in the bill was not communal but only provided safeguards for educational interests of different communities. This was, of course, unlike in Calcutta University where voice was hushed by brute majority. According to him, "the board is more representative than the syndicate of the University of Calcutta as it does have adequate representation of Muslims, Hindus, Scheduled Castes and Europeans and various other interests". He believed that "The Muslims will only have an effective voice in the control, regulation and administration of secondary education in Bengal" and that the board was called communal "because a government supported by a Muslim majority contemplates its formation".[60]

He declared that he was as proud of the great sons of Bengal like Ashutosh Mukherjee, Keshab Sen and Rammohan Roy "who played a most decisive role in shaping the educational destinies of the province and laying the structure on a solid foundation". He continued, "But...while our Hindu brethren have thrived and prospered...Muslims have languished and pined away in misery. Neither the university nor the government of the day encouraged and fostered the growth and revival of the glorious heritage of Islam that constitutes a distinct landmark in the history of world civilisation and culture..." He alleged that "Muslim boys have been compelled to feed on ideals and ideas hostile to the spirit and genius of Islam and drift into the morass of complexes that never constitute the part and parcel of their cultural existence..." He maintained that control of secondary education therefore, was "absolutely necessary not for or by one community alone, but for all classes and conditions of people that inhabit this land". He concluded his speech refusing to accept the challenge thrown by Syamaprasad Mookerjee in a public meeting, as that would be most unfortunate for Bengal.[61]

However, unlike Badradduza, Abdul Latif Biswas would accept the challenge "for the good of the province".[62] Abdul Wahab Khan posed that they were accused of communalism but it would be evident from the speeches made by the opposition leaders who were really communal. He particularly referred to the speeches by Syamaprasad and Sarat Chandra Bose.[63] Sarat Bose, it is said, threatened to build one national secondary board parallel to government's board. Syamaprasad also threatened to build a separate system for Hindus.

Abdur Raschid Mahmood observed, "It is very interesting to observe that my Hindu brethren, though thinking all the time on communal lines, express in national terms, although they—the Muslims—by their vast majority form the nation of Bengal." He supported the bill and wanted 'more substantial education' to prepare "the masses of Bengal for the national responsibilities—the responsibilities of a free nation".[64] Jalaluddin Ahmed considered "that nationalism is only another kind of communalism in the name of nation..." and "is worse than communalism".[65]

Abul Hasim as an example of Hindu bias and Hindu nationalism quoted from Abanindranath Tagore's *Rajkahani*; an approved text-book taught in Hare School.

Sei abosare Sultaner jato amir omra lungi chere, dari fele bibi ar murgir khacha nye ratarati sahar chere Ajmirer dike champat dilo Sakal bela Prithwiraj Toda dakhal kare nilen[66] [In the nick of time, all the 'amirs' and 'omrahs' shed their 'lungies', shaved their beards, and carrying their 'bibis' and cages of hens turntail during the night and fled the town for Ajmer, the next morning, for Prithviraj, occupation of Toda was just a walk over!]

The passage is written in a very lucid style and it may appear funny to a Hindu child. It may not however appear as funny to a Moslem child. Rather, he may seriously feel hurt as the passage could barely conceal an attitude of contempt for Moslem ethos. (One may note the use of Bengali verbs *champat dilo* used for amirs while *dakhal kare nilen* in case of Prithviraj.) It was no wonder that most of the Moslem speakers expressed their resentment against the approved text-books and Hindu domination over text-book selection committee. This was perhaps the moot cause which led them to demand 'an effective voice' in the educational management of the province.

Fazlur Rahaman, representative of Dacca University, though not equal to Syamaprasad in oratory, was as scathing in his remarks. He would not mince his words in attacking Calcutta University and Hindu domination over the system of education. He argued, "no nation can be great unless it learns to respect its own culture and traditions. The University of Calcutta is responsible for presenting the past history of India to the school boy in a manner that it carries an impression that anything that is Hindu is good and anything that is Muslim is bad. The result is that every Muslim boy who receives the training at an institution under the control of the Calcutta University grows with the idea that he belongs to an inferior stock and thus develops an inferiority complex. He loses self-confidence and becomes timid in his attitudes towards life." As a result "the Hindu boys cannot take kindly to the Muslim boys and begin to develop a feeling of hatred towards them. This explains much of the bitterness between the two great communities of the province."[67] He argued further, "an examination of the educational policy of the university will convince one that in formulating its educational policy, it has proceeded on the basis that the people of Bengal are homogeneous and Hindu in character. It has completely ignored the distinct cultural and educational needs of the Muslims." He even alleged that the policy was so successful that even "distinguished publicmen of the Hindu community cannot appreciate the distinctive character and excellence of Muslim culture and Muslim sentiments" as they were the product of the education provided by the university.[68]

VI

Let us now pause for a while and see where do we stand after tracing the line of debate in the assembly so far. It is clear that the House was vertically split into two contending communal groups cutting across political affiliations of the members on the

issue of the Bengal Secondary Education Bill, 1940.

The Hindu members of the House opposed the bill on two basic grounds. These were (i) government control, and (ii) communal representation. They claimed to have been championing the cause of secular and national education. According to them government control and communal representation were detrimental to the cause of secular and national education and as such no compromise on these two fundamental points was possible.

On the other hand, Moslem members considered both government control and communal representation necessary for safeguarding the educational interests of the Moslem community and refused to yield on these two counts.

It is interesting to note that the Hindu members condemned communalism in education from the postulate that the arena of education was sacrosanct and secular and national education was ideal. But they did not find it inconsistent to boast about the Hindu contribution and even to build a separate system for non-Moslems. Moslem members, on the other hand, defended the communal representation on two basic assumptions that the cultural roots of the two communities were different and the existing system of education was biased in favour of one community. To free the system from the clutch of one community they considered to be the pre-condition for building a general system which would take care of the educational interests of different communities. The general thrust of their arguments was to prove the Hindu bias and dominance over different spheres of education like text-books, curriculum, syllabus and management. Their demand was for a 'fair share' in all these spheres of education. It is apparent that Hindu members attacked communalism to defend Hindu interests which they felt was threatened by the bill while Moslem members attacked Hindu vested interests in the present system of education to safeguard their own educational interests which they thought was neglected so long.

To come back to our story, the motion by Harendra Nath Choudhury for eliciting public opinion was then put to vote and was lost with 71 votes in favour and 131 against. An analysis of the voting on this motion shows that all the Hindu members, excepting the Hindu ministers, voted for it while all the Moslem members excepting the three independent members, voted against it. Fazlul Huq's motion to refer the bill to a select committee thereafter was adopted by the House by 121 votes in favour and 60 against.

VII

On September 2, 1941, the report of the select committee was placed before the House by Fazlul Huq. Harendra Nath Choudhury proposed eight amendments and moved a motion to recommit the bill to the same select committee to make amendments as proposed. In a fervent speech he said that since the bill had summarily been referred to the select committee "Bengal has known no peace. For about a year educated public opinion in Bengal continues to be exercised more by this measure than either by war abroad or even by riots within the province... The communal fascism in the educational sphere that the bill promises to introduce can only find a non-communal parallel in any of the totalitarian countries with which the government of India may either be at war or allied."[69]
